**Third-party materials.** If you wish to reuse material from this work that is attributed to a third party, such as tables, figures or images, it is your responsibility to determine whether permission is needed for that reuse and to obtain permission from the copyright holder. The risk of claims resulting from infringement of any third-party-owned component in the work rests solely with the user.

**General disclaimers.** The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement.

The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or recommended by WHO in preference to others of a similar nature that are not mentioned. Errors and omissions excepted, the names of proprietary products are distinguished by initial capital letters.

All reasonable precautions have been taken by WHO to verify the information contained in this publication. However, the published material is being distributed without warranty of any kind, either expressed or implied. The responsibility for the interpretation and use of the material lies with the reader. In no event shall WHO be liable for damages arising from its use.

## Correct use of ICD-11

Please refer to the reference guide for the correct use of ICD-11 (<https://icdcdn.who.int/icd11referenceguide/en/html/index.html> ).

To prevent the dilution of ICD's purpose to provide a definitive standard for identifying health information, ICD-11 may not be used for the purpose of developing or promoting a different standard.

The use of ICD-11 in software products is subject to the following license: <https://icd.who.int/en/docs/ICD11-license.pdf>. Under the terms of this license, users may not:

- reproduce ICD-11 in part or whole and distribute it under a different name or without attribution;
- reproduce and distribute ICD-11 in part or whole without the ICD-11 codes;
- reproduce ICD-11 in part or whole without the ICD-11 URIs (not applicable for print publications).

Mappings or crosslinks between other classifications and terminologies and ICD-11 and/or translations are not covered by the ICD-11 license and are subject to a separate written agreement from WHO.

Adding data fields to ICD-11 concepts is permitted, provided such additions are clearly identified as additions that do not originate from WHO.

Suggestions for changes to ICD-11 should be submitted as a proposal to the ICD-11 maintenance platform (<https://icd.who.int/en>).

## TABLE OF CONTENTS

# CHAPTER 01

---

## Certain infectious or parasitic diseases

This chapter has 342 four-character categories.

Code range starts with 1A00

This chapter includes certain conditions caused by pathogenic organisms or microorganisms, such as bacteria, viruses, parasites or fungi.

**Exclusions:** Infection arising from device, implant or graft, not elsewhere classified (NE83.1)

**Coded Elsewhere:** Infections of the fetus or newborn (KA60-KA6Z)

Human prion diseases (8E00-8E0Z)

Pneumonia (CA40)

This chapter contains the following top level blocks:

- Gastroenteritis or colitis of infectious origin
- Predominantly sexually transmitted infections
- Mycobacterial diseases
- Certain staphylococcal or streptococcal diseases
- Pyogenic bacterial infections of the skin or subcutaneous tissues
- Certain zoonotic bacterial diseases
- Other bacterial diseases
- Human immunodeficiency virus disease
- Viral infections of the central nervous system
- Non-viral and unspecified infections of the central nervous system
- Dengue
- Certain arthropod-borne viral fevers
- Certain zoonotic viral diseases
- Certain other viral diseases
- Influenza
- Viral hepatitis
- Viral infections characterised by skin or mucous membrane lesions
- Mycoses
- Parasitic diseases
- Sepsis
- Sequelae of infectious diseases

## Gastroenteritis or colitis of infectious origin (1A00-1A40.Z)

**Coded Elsewhere:** Intestinal fungal infections

### Bacterial intestinal infections (1A00-1A0Z)

Any condition of the intestines, caused by an infection with a bacterial source.

**Exclusions:** Bacterial foodborne intoxications (1A10-1A1Z)

**Coded Elsewhere:** Abdominal actinomycosis (1C10.1)

Listerial gastroenteritis (1C1A.Y)

#### 1A00

##### **Cholera**

Cholera is a potentially epidemic and life-threatening infection of the intestine, characterised by extreme watery (secretory) diarrhoea often accompanied by vomiting, with rapid depletion of body fluids and salt that may result in hypovolemic shock and acidosis. Cholera outbreaks are caused by toxigenic strains of *Vibrio cholerae* serogroups O1 and O139. Serogroup O1 has two biovars; classical and eltor. *Vibrio cholerae* O1, biovar cholerae is classical type. *Vibrio cholerae* O1, biovar eltor is eltor type.

**Inclusions:** cholera syndrome

#### 1A01

##### **Intestinal infection due to other *Vibrio***

#### 1A02

##### **Intestinal infections due to *Shigella***

A disease caused by an infection with the gram-negative bacteria genus *Shigella*. This disease is characterised by an acute onset of small volume diarrhoea, accompanied by fever and nausea. This disease may also present with toxæmia, vomiting, cramps, and tenesmus. Transmission is by ingestion of contaminated food, or direct contact. Confirmation is by identification of *Shigella* in a faecal sample.

**Coded Elsewhere:** Sepsis due to shigella with septic shock (1C41)

#### 1A03

##### **Intestinal infections due to *Escherichia coli***

Any condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria *Escherichia coli*.

#### 1A03.0

##### **Enteropathogenic *Escherichia coli* infection**

An infection of the gastrointestinal system, caused by the gram-negative bacteria *Escherichia coli*. It is characterised by acute, profuse, watery diarrhoea. Transmission is by the faecal-oral route from contaminated food, water, or fomites. Confirmation is by identification of enteropathogenic *Escherichia coli* (EPEC) in a faecal sample.

#### 1A03.1

##### **Enterotoxigenic *Escherichia coli* infection**

A condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria *Escherichia coli*. This condition is characterised by acute, watery diarrhoea due to toxins released from the bacteria. Transmission is by the faecal-oral route from ingestion of contaminated food, water, or fomites. Confirmation is by identification of the *Escherichia coli* in faecal sample.

|               |                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1A03.2</b> | <b>Enteroinvasive Escherichia coli infection</b>                     | A condition of the gastrointestinal system, caused by an infection with the gram-negative bacteria Escherichia coli. This condition is characterised by acute and profuse diarrhoea (that may be haemorrhagic), fever, and abdominal cramps. Transmission is by the faecal-oral route from ingestion of contaminated food or water. Confirmation is by identification of the Escherichia coli in a faecal sample.                                                                                                                                                                                                                                          |
| <b>1A03.3</b> | <b>Enterohaemorrhagic Escherichia coli infection</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>1A03.Y</b> | <b>Intestinal infections due to other specified Escherichia coli</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>1A03.Z</b> | <b>Intestinal infections due to Escherichia coli, unspecified</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>1A04</b>   | <b>Intestinal infections due to Clostridioides difficile</b>         | A disease of the colon, caused by an infection with the gram-positive bacteria Clostridioides difficile (formerly known as Clostridium difficile). This disease is characterised by colitis, diarrhoea, abdominal pain, and fever. Transmission is commonly by direct or indirect contact, or from a disturbance of the normal bacterial flora of the colon. Confirmation is by identification of Clostridioides difficile in a faecal sample.<br><br><b>Exclusions:</b> Necrotising enterocolitis of newborn (KB88)                                                                                                                                       |
| <b>1A05</b>   | <b>Intestinal infections due to Yersinia enterocolitica</b>          | A disease of the intestinal tract, caused by an infection with the gram-negative bacteria Yersinia enterocolitica. This disease commonly presents with a fever, diarrhoea, or abdominal pain. This disease may also lead to a systemic infection. Transmission is by the faecal-oral route from the ingestion of contaminated food or water, or direct contact with infected individuals or animal. Confirmation is by identification of Yersinia enterocolitica in a faecal sample.<br><br><b>Exclusions:</b> Extraintestinal yersiniosis (1B9A)<br><b>Coded Elsewhere:</b> Postinfectious arthropathy in enteritis due to Yersinia enterocolitica (1A05) |
| <b>1A06</b>   | <b>Gastroenteritis due to Campylobacter</b>                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>1A07</b>   | <b>Typhoid fever</b>                                                 | A condition caused by an infection with the gram-negative bacteria Salmonella typhi. This condition is characterised by an acute sustained fever. This condition may present with weakness, stomach pains, headache, loss of appetite, or flat, rose-coloured spots. Transmission is by the faecal-oral route from the ingestion of contaminated food or water. Confirmation is by identification of Salmonella typhi in a faecal or blood sample.                                                                                                                                                                                                         |
| <b>1A07.0</b> | <b>Typhoid peritonitis</b>                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**1A08****Paratyphoid fever**

A condition caused by an infection with the gram-negative bacteria *Salmonella* paratyphi. This condition is characterised by an acute sustained fever. The individual may feel weak, have stomach pains, headache, loss of appetite, or a rash of flat, rose-coloured spots. Transmission is by ingestion of contaminated food or water. Confirmation is by identification of *Salmonella* paratyphi in a faecal or blood sample.

**1A09****Infections due to other *Salmonella***

**Coding Note:** Infection or foodborne intoxication due to any *Salmonella* species other than *S. typhi* and *S. paratyphi*

**1A09.0*****Salmonella* enteritis**

This refers to inflammation of the small intestine due to infection with bacteria of the genus *Salmonella*, a member of the family Enterobacteriaceae. Bacteria of the genus *Salmonella* are rod-shaped, Gram-negative, non-spore-forming and predominantly motile.

**1A09.Y****Infections due to other *Salmonella* in other organs**

**Coding Note:** Infection or foodborne intoxication due to any *Salmonella* species other than *S. typhi* and *S. paratyphi*

**1A09.Z*****Salmonella* infection, unspecified**

**Coding Note:** Infection or foodborne intoxication due to any *Salmonella* species other than *S. typhi* and *S. paratyphi*

**1A0Y****Other specified bacterial intestinal infections****1A0Z****Bacterial intestinal infections, unspecified**

Bacterial foodborne intoxications (1A10-1A1Z)

Any condition caused by an intoxication due to a bacterial toxin. Intoxication is by ingestion of contaminated food.

**Exclusions:**

salmonella foodborne intoxication and infection (1A09)

Listeriosis (1C1A)

Harmful effects of or exposure to noxious substances, Substances chiefly nonmedicinal as to source, Other noxious substances eaten as food (NE61)

Ichthyotoxism not specified as bacterial (NE61)

**1A10****Foodborne staphylococcal intoxication****1A11****Botulism**

A disease caused by an infection with the gram-positive bacteria *Clostridium botulinum*. This disease commonly presents with abdominal pain, vomiting, acute paralysis, blurred vision, diplopia, and may be fatal. Transmission is by ingestion of contaminated food, direct contact, or from accidental overdose. Confirmation is by identification of *Clostridium botulinum* in a faecal or food sample.

#### Viral intestinal infections (1A20-1A2Z)

Any condition of the intestines, caused by an infection with a viral source.

**Exclusions:** influenza with involvement of gastrointestinal tract (1E32)

**Coded Elsewhere:** Herpes simplex virus duodenitis (1F00.Y)

Human immunodeficiency virus disease enteritis (1C62.2)

|             |                                                                                                                                                                                                                                                                                                                                           |

| <b>1A20</b> | <b>Enteritis due to Adenovirus</b>                                                                                                                                                                                                                                                                                                        |
|             | A disease of the intestinal tract, caused by an infection with adenovirus. This disease is characterised by a fever, diarrhoea, or vomiting. Transmission is by the faecal-oral route.                                                                                                                                                    |
| <b>1A21</b> | <b>Gastroenteritis due to Astrovirus</b>                                                                                                                                                                                                                                                                                                  |
| <b>1A22</b> | <b>Gastroenteritis due to Rotavirus</b>                                                                                                                                                                                                                                                                                                   |
|             | A disease of the gastrointestinal tract, caused by an infection with rotavirus. This disease is characterised by acute onset of vomiting, non-haemorrhagic diarrhoea, and abdominal pain. Transmission is by ingestion of contaminated food or water, direct contact, or through fomites. Confirmation is by identification of rotavirus. |
| <b>1A23</b> | <b>Enteritis due to Norovirus</b>                                                                                                                                                                                                                                                                                                         |
|             | A disease of the gastrointestinal tract, caused by an infection with norovirus. This disease is characterised by acute onset of vomiting, non-haemorrhagic diarrhoea, and abdominal pain. Transmission is by ingestion of contaminated food or water, direct contact, or through fomites. Confirmation is by identification of norovirus. |
| <b>1A24</b> | <b>Intestinal infections due to Cytomegalovirus</b>                                                                                                                                                                                                                                                                                       |
|             | A condition of the intestinal tract, caused by an infection with cytomegalovirus. The condition is characterised by diarrhoea, fever, abdominal pain, or haematochezia. Transmission is by direct contact with infected body fluids.                                                                                                      |
| <b>1A2Y</b> | <b>Other specified viral intestinal infections</b>                                                                                                                                                                                                                                                                                        |
| <b>1A2Z</b> | <b>Viral intestinal infections, unspecified</b>                                                                                                                                                                                                                                                                                           |

## Protozoal intestinal infections (1A30-1A3Z)

Any condition of the intestines, caused by an infection with a protozoal parasitic source.

### 1A30

#### **Infections due to *Balantidium coli***

Any condition caused by an infection with the protozoan parasite *Balantidium coli*.

### 1A31

#### **Giardiasis**

A condition caused by an infection with the protozoan parasite *Giardia*. This condition is characterised by gastroenteritis, or may be asymptomatic. Transmission is by the faecal-oral route from the ingestion of contaminated food or water. Confirmation is by identification of *Giardia* in a faecal sample.

### 1A32

#### **Cryptosporidiosis**

Any condition caused by an infection with the protozoan parasite *Cryptosporidium*.

### 1A33

#### **Cystoisosporiasis**

A disease caused by the protozoan parasite *Cystoisospora belli*. This disease is characterised by watery diarrhoea, fever, abdominal pain, nausea, or malaise. Transmission is by the faecal-oral route, commonly through the ingestion of contaminated food or water. Confirmation is by identification of *Cystoisospora belli* in a faecal sample.

#### 1A33.0

##### **Cystoisosporiasis of small intestine**

**Inclusions:**                      Infection due to *Isospora belli*  
                                            Infection due to *Isospora hominis*

#### 1A33.1

##### **Cystoisosporiasis of colon**

Isosporiasis of colon is a large intestinal inflammation caused by the protozoan *Isospora belli*.

#### 1A33.Y

##### **Other specified cystoisosporiasis**

#### 1A33.Z

##### **Cystoisosporiasis, unspecified**

### 1A34

#### **Sarcocystosis**

Any condition caused by an infection with the protozoan parasite *Sarcocystis*.

**Inclusions:**                      Sarcosporidiosis

### 1A35

#### **Blastocystosis**

### 1A36

#### **Amoebiasis**

**Inclusions:**                      infection due to *Entamoeba histolytica*

#### 1A36.0

##### **Intestinal infections due to *Entamoeba***

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Predominantly sexually transmitted infections (1A60-1A9Z)

**Exclusions:** Nonspecific and nongonococcal urethritis (GC02.1)  
Arthropathy following genitourinary infection (FA11.2)

**Coded Elsewhere:** Sexually transmissible viral hepatitis  
Herpes simplex labialis (1F00.01)  
Herpes simplex gingivostomatitis (1F00.02)  
Vulvovaginal candidosis (1F23.10)  
Candida balanoposthitis (1F23.11)  
Human immunodeficiency virus disease (1C60-1C62.Z)  
Other infections with a predominantly sexual mode of transmission complicating pregnancy, childbirth or the puerperium (JB63.3)  
Candidosis of external genitalia (1F23.1Z)  
Anogenital molluscum contagiosum (1E76)

### Syphilis (1A60-1A6Z)

A predominantly sexually transmitted infection caused by *Treponema pallidum* ssp. *pallidum*.

**Coded Elsewhere:** Syphilis complicating pregnancy, childbirth or the puerperium (JB63.1)

**1A63****Latent syphilis, unspecified as early or late**

A disease caused by an infection with the gram-negative bacteria *Treponema pallidum pallidum*. This disease is characterised by serologic proof of infection without symptoms of disease. Transmission is commonly by sexual contact.

**Inclusions:** Positive serological reaction for syphilis

**1A6Z****Syphilis, unspecified**

Gonococcal infection (1A70-1A7Z)

A condition caused by an infection with the gram-negative bacteria *Neisseria gonorrhoeae*. Transmission is by sexual contact. Confirmation is by identification of *Neisseria gonorrhoeae*.

**Coded Elsewhere:** Gonorrhoea complicating pregnancy, childbirth or the puerperium (JB63.2)

**1A70****Gonococcal genitourinary infection****1A70.0 Gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess**

**Exclusions:** Gonococcal infection of lower genitourinary tract with periurethral or accessory gland abscess (1A70.1)

**1A70.00** Gonorrhoea of penis

**1A70.0Y** Other specified gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess

**1A70.0Z** Gonococcal infection of lower genitourinary tract without periurethral or accessory gland abscess, unspecified

**1A70.1 Gonococcal infection of lower genitourinary tract with periurethral or accessory gland abscess**

**1A70.Y** Gonococcal infection of other specified genitourinary organ

**1A70.Z** Gonococcal genitourinary infection, unspecified

**1A71****Gonococcal pelviperitonitis**

This is an inflammation of the peritoneum, the thin tissue that lines the inner wall of the abdomen and covers most of the abdominal organs.

**1A72****Gonococcal infection of other sites****1A72.0 Gonococcal infection of musculoskeletal system**

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the musculoskeletal system.

**1A72.1 Gonococcal infection of rectum**

This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea of the rectum.

- 1A72.2 Gonococcal infection of anus**  
This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the anus.
- 1A72.3 Gonococcal pharyngitis**
- 1A72.4 Gonococcal infection of eye**  
This is a species of Gram-negative coffee bean-shaped diplococci bacteria responsible for the sexually transmitted infection gonorrhoea. This diagnosis is of the eye.  
**Coded Elsewhere:** Neonatal conjunctivitis or dacryocystitis due to *Neisseria gonorrhoeae* (KA65.0)
- 1A72.Y Gonococcal infection of other specified sites**
- 1A73 Disseminated gonococcal infection**  
Disseminated gonococcal infection occurs when there is bacteremic dissemination of *Neisseria gonorrhoeae* from its initial focus of infection in female pelvic organs. It manifests as pain and swelling around one or more joints, intermittent crops of erythematous papules and pustules on the limbs, fever and rigors. Blood cultures may be but are not always positive.
- 1A7Z Gonococcal infection, unspecified**

Sexually transmissible infections due to chlamydia (1A80-1A8Z)

An infection with the gram-negative bacteria *Chlamydia trachomatis*. This infection may be asymptomatic or characterised by fever, painful urination, urinary urgency, dyspareunia, vaginal bleeding or discharge, pain in the abdomen in females and by fever, urethritis, painful urination, discharge from the penis, swollen or tender testicles in males. Transmission is by anal, vaginal, or oral sex. Confirmation is by identification of *Chlamydia trachomatis*.

- 1A80 Chlamydial lymphogranuloma**  
A disease of the inguinal lymph glands, caused by an infection with the gram-negative bacteria *Chlamydia trachomatis*. This disease is characterised by a genital ulcer, buboes, abscesses in the groin, blood in faeces, tenesmus, or proctocolitis. Transmission is by sexual contact. Confirmation is by identification of *Chlamydia trachomatis* in a blood sample or by polymerase chain reaction tests.

**Inclusions:** Durand-Nicolas-Favre disease

- 1A81 Non-ulcerative sexually transmitted chlamydial infection**

**Exclusions:** Neonatal chlamydial pneumonia (KB24)  
Neonatal conjunctivitis due to *Chlamydia* (KA65.0)  
Chlamydial lymphogranuloma (1A80)  
Chlamydial peritonitis (1C21)  
Trachoma (1C23)

- 1A81.0 Chlamydial infection of lower genitourinary tract**

| 1A90   | <b>Chancroid</b><br>A disease caused by an infection with the gram-negative bacteria <i>Haemophilus ducreyi</i> . This disease is characterised by painful ulcer(s) on the genitalia. Transmission is by sexual contact. Confirmation is by identification of <i>Haemophilus ducreyi</i> from the ulcer exudate.<br><i>Inclusions:</i> Ulcus molle                                                                                                                                                                                                                                                           |
| 1A91   | <b>Granuloma inguinale</b><br>A disease caused by infection with the gram-negative bacterium <i>Klebsiella granulomatis</i> . It commonly presents with painless genital ulceration following contact with an infected sexual partner. Small, painless nodules appear after an incubation period of about 10–40 days; later the nodules break down to create open, fleshy, oozing ulcers which gradually extend, mutilating the infected tissue. The lesions occur at the region of contact and are typically found on the shaft of the penis, the labia, or the perineum.<br><i>Inclusions:</i> Donovanosis |
| 1A92   | <b>Trichomoniasis</b><br>A disease caused by an infection with the protozoan parasite <i>Trichomonas</i> . ## Mycobacterial diseases (1B10-1B2Z)

### Tuberculosis (1B10-1B1Z)

A disease caused by an infection with bacteria of the *Mycobacterium tuberculosis* complex. This disease presents with symptoms depending on the site of infection. Transmission is commonly by inhalation of infected respiratory secretions.

**Inclusions:** Infections due to *Mycobacterium tuberculosis* and *Mycobacterium bovis*

**Exclusions:** Pneumoconiosis associated with tuberculosis (CA60.3)

**Coded Elsewhere:** Congenital tuberculosis (KA61.0)

Tuberculosis complicating pregnancy, childbirth or the puerperium (JB63.0)

HIV disease clinical stage 1 associated with tuberculosis (1C60.0)

HIV disease clinical stage 2 associated with tuberculosis (1C60.1)

HIV disease clinical stage 3 associated with tuberculosis (1C60.2)

HIV disease clinical stage 4 associated with tuberculosis (1C60.3)

Human immunodeficiency virus disease associated with tuberculosis (1C60)

Tuberculosis of orbit (9A22.2)

### 1B10

#### **Tuberculosis of the respiratory system**

This is a progressive or chronic disease resulting from infection with the bacterium *Mycobacterium tuberculosis* or other bacteria in the *M. tuberculosis* complex: *M. bovis*, *M. africanum*, *M. canetti*, *M. microti* and *M. pinnipedii*. The infection is limited to the respiratory system.

#### **1B10.0**

##### **Respiratory tuberculosis, confirmed**

A disease of the respiratory tract, caused by an infection with the bacteria *Mycobacterium tuberculosis*, which has been confirmed by laboratory testing. This disease is characterised by chronic cough, and sputum production that may be haemorrhagic. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by identification of *Mycobacterium tuberculosis* in clinical samples.

#### **1B10.1**

##### **Respiratory tuberculosis, not confirmed**

A disease of the respiratory tract, caused by an infection with the bacteria *Mycobacterium tuberculosis*, which has not been confirmed. This disease is characterised by a chronic cough, and sputum production that may be haemorrhagic. Transmission is commonly by inhalation of infected respiratory secretions.

#### **1B10.Z**

##### **Respiratory tuberculosis, without mention of bacteriological or histological confirmation**

**1B11****Tuberculosis of the nervous system**

A disease of the central nervous system, caused by an infection with bacteria of the *Mycobacterium tuberculosis* complex. This disease is characterised by neurological deficits depending on the site affected. Transmission is through haematogenous spread to the nervous system after inhalation of infected respiratory secretions. Confirmation is by identification of bacteria of the *Mycobacterium tuberculosis* complex in the cerebrospinal fluid.

**1B11.0****Tuberculous meningitis**

A disease of the meninges, caused by an infection with the bacteria *Mycobacterium tuberculosis*. This disease is characterised by fever, headache, or neurological deficits. Transmission is through haematogenous spread to the meninges after inhalation of infected respiratory secretions. Confirmation is by identification of *Mycobacterium tuberculosis* in the cerebrospinal fluid.

**Inclusions:** Tuberculous leptomeningitis

**1B11.1****Tuberculous meningoencephalitis****1B11.2****Meningeal tuberculoma**

Meningeal tuberculomas are conglomerate caseous foci within the meninges of the brain, caused by dissemination of tuberculosis to the central nervous system.

**Inclusions:** Tuberculoma of meninges

**1B11.3****Tuberculous granuloma of brain****1B11.Y****Tuberculosis of other specified part of nervous system****1B11.Z****Tuberculosis of the nervous system, unspecified****1B12****Tuberculosis of other systems and organs****1B12.0****Tuberculosis of heart**

*Mycobacterium tuberculosis* infection involving the heart and pericardium

**1B12.1****Tuberculosis of eye**

Tuberculosis involving the eye. This may manifest in multiple different ways including keratoconjunctivitis, episcleritis, anterior uveitis and posterior uveitis

**Exclusions:** lupus vulgaris of eyelid (1B12.8)

**1B12.2****Tuberculosis of ear**

This is a common, and in many cases lethal, infectious disease caused by various strains of mycobacteria, usually *Mycobacterium tuberculosis*. This diagnosis is of the ear.

**Exclusions:** tuberculosis of skin of external ear (1B12.8)  
Tuberculous mastoiditis (1B12.40)

**1B12.3****Tuberculosis of endocrine glands**

Infection of endocrine glands by *Mycobacterium tuberculosis* with resultant endocrine disturbances including adrenal or pituitary failure.

**Coded Elsewhere:** Tuberculous Addison disease (1B12.3)

| <b>1B12.40</b> | Tuberculosis of bones or joints<br>A disease of the bones and joints, caused by an infection with the bacteria <i>Mycobacterium tuberculosis</i> . This disease commonly presents with bone pain, joint inflammation, loss of movement or feeling in the affected bone or joint, and weak bones prone to fracture. Transmission is through haematogenous spread to the bones and joints after inhalation of infected respiratory secretions. Confirmation is by identification of <i>Mycobacterium tuberculosis</i> in biopsy samples of the affected site.                                                                                                                                                                                                                                                                        |

| <b>1B13.0</b>  | <b>Acute miliary tuberculosis of a single specified site</b><br>A disease caused by an infection with the bacteria <i>Mycobacterium tuberculosis</i> that is disseminated through the body, and affecting a specific body site. This disease is characterised by numerous small lesions of 1-5 millimetre(s) in any organ, and fever. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by radiography, CT, ultrasonography, and identification of <i>Mycobacterium tuberculosis</i> , depending on the site affected.                  |
| <b>1B13.1</b>  | <b>Acute miliary tuberculosis of multiple sites</b><br>A disease caused by an infection with the bacteria <i>Mycobacterium tuberculosis</i> that is disseminated through the body, and affecting multiple body sites. This disease is characterised by numerous small lesions of 1-5 millimetre(s) in more than one organ, and fever. Transmission is commonly by inhalation of infected respiratory secretions. Confirmation is by radiography, advanced imaging, ultrasonography, and identification of <i>Mycobacterium tuberculosis</i> , depending on the sites affected.   |

| <b>1B20.20</b> | Type I leprosy reaction<br>This phenomenon, also named “upgrading reaction,” occurs in borderline leprosy states and is associated with an increase in cell-mediated immunity. It occurs typically within the first 6 months of treatment in previously untreated patients but may be related to stress, intercurrent infections, or pregnancy. Clinical features include inflammatory swelling, erythema and occasionally ulceration of existing lesions, constitutional symptoms and neuritis. If the neuritis is not treated promptly permanent motor nerve damage may ensue. |

**Acute rheumatic fever (1B40-1B42)**

A disease of the connective tissue, caused by an infection with the gram-positive bacteria *Streptococcus pyogenes* (the disease may also affect the heart, joints, central nervous system, subcutaneous tissues, or skin). This disease is characterised by fever, polyarthritides, carditis, subcutaneous nodules, or erythema marginatum. Transmission is through haematogenous spread to other parts of the body after direct or indirect contact. Confirmation is by electrocardiography, sedimentation rate, or identification of *Streptococcus pyogenes* in a blood sample.

**Coded Elsewhere:** Erythema marginatum rheumaticum (EA50.0)

**1B40****Acute rheumatic fever without mention of heart involvement****1B40.0****Rheumatic arthritis, acute or subacute****1B40.Y****Other specified acute rheumatic fever without mention of heart involvement****1B40.Z****Acute rheumatic fever without mention of heart involvement, unspecified**

**1B41****Acute rheumatic fever with heart involvement**

A disease of the cardiovascular system, caused as a result of rheumatic fever. Rheumatic heart disease is characterised by repeated inflammation with fibrinous repair. This disease may present with cardinal anatomic changes of the valve including leaflet thickening, commissural fusion, and shortening and thickening of the tendinous cords. Inflammation and valve scarring may also occur. Confirmation is by a thoracic radiography or echocardiography.

 Rheumatic pulmonary valve insufficiency (BB91.0)  
 Rheumatic pulmonary valve stenosis with insufficiency (BB92.0)

**1B41.0****Acute rheumatic pericarditis**

A disease of the pericardium, caused by acute rheumatic fever. This disease is characterised by fever, dry cough, rapid heart rate, fatigue, or low blood pressure. Confirmation is by echocardiography, or thoracic radiography.

**1B41.1****Acute rheumatic endocarditis**

A disease of the endocardium, caused as a result of acute rheumatic fever. This disease is characterised by a high fever, chills, shortness of breath, rapid or irregular heartbeat, coughing up of blood, abdominal pain or septicaemia. This disease commonly presents with valvular involvement. Confirmation is by echocardiography.

**1B41.10**

Rheumatic aortitis

**1B41.1Y**

Other specified acute rheumatic endocarditis

**1B41.1Z**

Acute rheumatic endocarditis, unspecified

**1B41.2****Acute rheumatic myocarditis**

Acute rheumatic myocarditis is cardiac inflammation associated with acute rheumatic fever triggered by an autoimmune reaction to group A streptococci infection resulting in pancarditis involving inflammation of the myocardium, endocardium, and epicardium, usually with left-sided valvar involvement.

**1B41.Y****Other acute rheumatic heart disease**

| <b>1B71.2</b> | <b>Neonatal necrotising fasciitis</b><br>Neonatal necrotising fasciitis is a life-threatening acute necrotising infection of fascia, subcutaneous tissues, and overlying skin similar to the condition seen in adults. It is rare in neonates but, in contrast to the adult form, tends to affect otherwise healthy babies. It has followed omphalitis, mastitis and postoperative wound infection, though preceding sites of infection are not always found. It has more commonly been associated with <i>Staphylococcus aureus</i> than with streptococcal infection. Gram-negative organisms have also been implicated. It may cause extensive tissue destruction and mortality is high. |

| <b>1B72.0</b>       | <b>Bullous impetigo</b><br>Bullous impetigo is a contagious superficial infection of the skin caused by certain strains of <i>Staphylococcus aureus</i> which release toxins into the local environment which are capable of cleaving desmoglein I, a protein involved in intercellular adhesion of epidermal keratinocytes. In contrast to the very superficial, rapidly shed and rarely observed blisters of non-bullous impetigo, the bullae of bullous impetigo are tense and well demarcated, sometimes reaching several centimetres in diameter before rupture.<br><b>Coded Elsewhere:</b> Neonatal bullous impetigo (EH11)                                                   |
| <b>1B72.1</b>       | <b>Non-bullous impetigo</b><br>Non-bullous impetigo is due to superficial skin infection with either <i>Streptococcus pyogenes</i> or <i>Staphylococcus aureus</i> or both. The very superficial blisters which form in the upper epidermis are soon shed and rarely seen (cf. bullous impetigo) so that it normally presents with areas of superficial oozing and crusting on the skin surface. It often following minor skin injury or on skin damaged by a preexisting dermatosis such as atopic eczema or scabies.                                                                                                                                                              |
| <b>1B72.2</b>       | <b>Secondary impetiginisation of the skin</b><br>Secondary infection of dermatoses such as atopic eczema by streptococci or staphylococci.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>1B73</b>         | <b>Ecthyma</b><br>Ecthyma is a superficial ulcerative bacterial pyoderma. It is characterised by small, purulent, shallow, punched-out ulcers with thick, brown-black crusts and surrounding erythema. The commonest form is caused by beta-haemolytic streptococci, often in association with <i>Staphylococcus aureus</i> . It is associated with poor hygiene and malnutrition. Ecthyma gangrenosum is an uncommon severe variant caused by <i>Pseudomonas aeruginosa</i> .                                                                                                                                                                                                      |

| <b>1B73.1</b>       | <b>Staphylococcal ecthyma</b><br>Ecthyma due to a monoinfection with <i>Staphylococcus aureus</i> . It is less common than streptococcal ecthyma.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>1B73.2</b>       | <b>Ecthyma gangrenosum</b><br>Ecthyma gangrenosum is a potentially life-threatening infection of skin in patients who are immunocompromised through disease or immunosuppressive therapy. It is most commonly caused by <i>Pseudomonas aeruginosa</i> though a variety of other organisms may be implicated. It is characterised by usually painless erythematous macules or plaques which progress to haemorrhagic blistering and necrosis of the skin. Lesions may be multiple and widely disseminated, though the anogenital area is a common site. <i>Pseudomonas</i> can frequently be cultured from the blood.<br><b>Coded Elsewhere:</b> Neonatal ecthyma gangrenosum (EH11) |

| <b>1B91</b>   | <b>Leptospirosis</b><br>A disease caused by an infection with the gram-negative bacteria <i>Leptospira</i> . In the first phase, this disease is characterised by generalised illness (fever, chills, or myalgias) or individuals may be asymptomatic; in the second phase, the heart, liver, kidneys, or brain may be affected by the infection (symptoms are dependent on the site affected). Transmission is by ingestion of contaminated food or water, droplet transmission, or direct cutaneous contact. Confirmation is by identification of <i>Leptospira</i> in samples from the affected individual. |
| <b>1B92</b>   | <b>Glanders</b><br>A disease caused by an infection with the gram-negative bacteria <i>Burkholderia mallei</i> . This disease presents with symptoms depending on the route of infection. Transmission is by contact with tissues or body fluids from infected animals (typically horses), or inhalation of infected aerosol. Confirmation is by identification of <i>Burkholderia mallei</i> in blood, sputum, urine, or skin samples.<br><br><b>Inclusions:</b> Infection due to <i>Pseudomonas mallei</i>                                                                                                   |
| <b>1B93</b>   | <b>Plague</b><br>A disease caused by an infection with the gram-negative bacteria <i>Yersinia pestis</i> . This disease presents with symptoms depending on the site of infection, and may be fatal. Transmission is through the bite of an infected flea, by direct contact, or by droplet transmission.                                                                                                                                                                                                                                                                                                      |
| <b>1B93.0</b> | <b>Bubonic plague</b><br>A disease caused by an infection with the gram-negative bacteria <i>Yersinia pestis</i> . This disease commonly presents with an infection of the lymph nodes leading to swelling and pain. This disease may also present with gangrene of the extremities, chills, malaise, high fever, muscle cramps, or seizures. Transmission is through the bite of an infected flea, by direct contact, or by droplet transmission.                                                                                                                                                             |
| <b>1B93.1</b> | <b>Cellulocutaneous plague</b><br>Cellulocutaneous plague is a zoonotic disease caused by <i>Yersinia pestis</i> (formerly known as <i>Pasteurella pestis</i> ) involving the skin around the flea bite which transmitted the pathogen.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>1B93.2</b> | <b>Pneumonic plague</b><br>Pneumonic plague is a zoonotic disease caused by <i>Yersinia pestis</i> (formerly known as <i>Pasteurella pestis</i> ) involving the lung. The lungs are seeded by hematogenous spread or from inhalation of the pathogen.                                                                                                                                                                                                                                                                                                                                                          |
| <b>1B93.3</b> | <b>Plague meningitis</b><br>Plague meningitis is a zoonotic disease caused by <i>Yersinia pestis</i> (formerly known as <i>Pasteurella pestis</i> ) that involves the central nervous system.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>1B93.Y</b> | <b>Other specified plague</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>1B93.Z</b> | <b>Plague, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**1B94****Tularaemia**

A disease caused by an infection with *Francisella tularensis*. This disease is characterised by fever, chills, headache, and weakness, as well as other symptoms depending on the route of infection. Transmission is through the bite of an infected tick or deer fly, by ingestion of contaminated water or food, airborne transmission, or by direct contact with infected animals. Confirmation is by identification of *Francisella tularensis*, or the presence of antibodies to *Francisella tularensis*, in a blood or sputum sample.

**Inclusions:**

- deer-fly fever
- rabbit fever
- infection due to *Francisella tularensis*

**1B94.0****Ulceroglandular tularaemia****1B94.Y****Other specified tularaemia****1B94.Z****Tularaemia, unspecified****1B95****Brucellosis**

A disease caused by an infection with the gram-negative bacteria *Brucella*. This disease is characterised by fever, muscular pain, or sweating. Transmission is by ingestion of unpasteurized milk and soft cheeses made from infected animals. Confirmation is by identification of *Brucella* or antibodies to *Brucella*.

**Inclusions:**

- Malta fever
- Mediterranean fever
- undulant fever

**Coded Elsewhere:** Spondylitis in brucellosis (FA13)

**1B96****Erysipeloid**

A disease caused by an infection with the gram-positive bacteria *Erysipelothrix rhusiopathiae*. This disease is characterised by localised cellulitis. Transmission is by direct cutaneous contact with *Erysipelothrix rhusiopathiae*, often in individuals handling seafood and raw meat.

**1B97****Anthrax**

A disease caused by an infection with the gram-positive bacteria *Bacillus anthracis*. This disease presents with clinical signs depending on the route of infection. Transmission is by inhalation, ingestion, or cutaneous contact with *Bacillus anthracis* spores. Confirmation is by identification of *Bacillus anthracis* in a sample, or detection of antibodies or toxins.

**1B98****Cat-scratch disease**

A disease commonly caused by an infection with the gram-negative bacteria *Bartonella henselae*. This disease is characterised by regional lymphadenopathy, or fever. Transmission is commonly from the scratch or bite of a cat infested with fleas infected with *Bartonella henselae*.

**Inclusions:**

- Cat-scratch fever
- Rochalimaea henselae* infection

**1B99****Pasteurellosis**

A disease caused by an infection with the gram-negative bacteria *Pasteurella*. This disease is characterised by local cellulitis and may lead to other clinical signs depending on the route of infection. Transmission is commonly by direct contact through the bite, scratch, or lick from an infected animal, inhalation of infected respiratory secretions, or ingestion of contaminated meat. Confirmation is by identification of *Pasteurella* from the affected individual.

**1B9A****Extraintestinal yersiniosis**

A disease caused by an infection with the gram-negative bacteria *Yersinia enterocolitica*, excluding infections in the intestinal tract. This disease presents with symptoms depending on the site of infection, and may lead to a systemic infection. Transmission is by the faecal-oral route from the ingestion of contaminated food or water, or direct contact with infected animals or humans. Confirmation is by identification of *Yersinia enterocolitica* from affected tissues.

**Exclusions:** Enteritis due to *Yersinia enterocolitica* (1A05)  
Plague (1B93)

**1B9Z****Unspecified zoonotic bacterial disease****Other bacterial diseases (1C10-1C4Z)**

**Coded Elsewhere:** Other bacterial infections of the fetus or newborn (KA61)

Bacterial duodenitis (DA51.6Y)

**1C10****Actinomycosis**

A disease commonly caused by an infection with the gram-positive bacteria *Actinomyces*. This disease is characterised by painful abscesses in the mouth, lungs, and gastrointestinal tract. Actinomycosis is an endogenous infection whose causative bacteria originate from the patient's oral and pharyngeal flora. It can spread by continuity and hematogenously. Confirmation is by identification of *Actinomyces* in infected tissue or fluid samples.

**Exclusions:** Actinomycetoma (1C43)

**1C10.0****Pulmonary actinomycosis**

This is a pulmonary infectious bacterial disease caused by *Actinomyces* species such as *Actinomyces israelii* or *A. gerencseriae*. It can also be caused by *Propionibacterium propionicus*, and the condition is likely to be polymicrobial aerobic-anaerobic infection.

**1C10.1****Abdominal actinomycosis**

This is a cervicofacial infectious bacterial disease caused by *Actinomyces* species such as *Actinomyces israelii* or *A. gerencseriae*. It can also be caused by *Propionibacterium propionicus*, and the condition is likely to be polymicrobial aerobic anaerobic infection.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                | Cervicofacial actinomycosis is the commonest clinical form of actinomycosis, a sporadically occurring endogenous polymicrobial inflammatory process in which fermentative actinomycetes of the genera <i>Actinomyces</i> (especially <i>A. israelii</i> and <i>A. gerencseriae</i> ), <i>Propionibacterium</i> and <i>Bifidobacterium</i> act as the principal pathogens. The typical presentation is a slowly progressive development from painless tissue infiltration and induration of soft tissues of the face and neck to multiple abscesses and draining sinus tracts discharging pus. Actinomycosis is a major factor and indicator of poor prognosis in infected osteoradionecrosis of the jaws following radiation therapy for head and neck cancer. |

|                | A disease commonly caused by an infection with the gram-negative bacteria <i>Bartonella bacilliformis</i> . This disease is characterised by severe haemolytic anaemia and transient immunosuppression. This disease may present with fever, malaise, or jaundice. Transmission is through the bite of infected sandflies from the genus <i>Lutzomyia</i> . Confirmation is by identification of <i>Bartonella bacilliformis</i> in a blood sample.                                                                                                                                                                                                                                                                                                            |

|                | A disease caused by an infection with the gram-negative bacteria <i>Bartonella bacilliformis</i> . This disease is characterised by multiple nodular and red-to-purple vascular skin lesions, subsequent to Oroya fever. Transmission is through the bite of infected sandflies from the genus <i>Lutzomyia</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>1C11.1</b>  | <b>Trench fever</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                | A disease caused by an infection with the gram-negative bacteria <i>Bartonella quintana</i> . This disease is characterised by fever, headache, rash, bone pain, or may be asymptomatic. Transmission is through the bite of infected body lice. Confirmation is by identification of <i>Bartonella quintana</i> in a blood sample. <i>Bartonella quintana</i> was formerly known as <i>Rickettsia quintana</i> .                                                                                                                                                                                                                                                                                                                                              |
|                | <b>Inclusions:</b> Quintan fever                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>1C11.Z</b>  | <b>Bartonellosis, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**1C12****Whooping cough**

A disease of the upper respiratory tract, caused by an infection with the gram-negative bacteria *Bordetella*. This disease typically presents with paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of *Bordetella* from nasopharyngeal samples or sputum, or detection of antibodies against *Bordetella*.

**1C12.0****Whooping cough due to *Bordetella pertussis***

A disease of the upper respiratory tract, caused by an infection of the gram-negative bacteria *Bordetella pertussis*. This disease typically presents with paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of *Bordetella pertussis* from nasopharyngeal samples or sputum, or detection of antibodies against *Bordetella pertussis*.

**1C12.1****Whooping cough due to *Bordetella parapertussis***

A disease of the upper respiratory tract, caused by an infection of the gram-negative bacteria *Bordetella parapertussis*. This disease typically presents with a mild clinical presentation of paroxysmal cough, inspiratory whoop, and fainting or vomiting after coughing. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of *Bordetella parapertussis* from nasopharyngeal samples or sputum, or detection of antibodies against *Bordetella parapertussis*.

**1C12.Y****Other specified whooping cough****1C12.Z****Whooping cough, unspecified****1C13****Tetanus**

A disease of the skeletal muscle fibres, caused by an infection with the gram-positive bacteria *Clostridium tetani*. This disease is characterised by muscle spasms. Transmission is by direct contact of an open wound.

**Exclusions:**                      Obstetrical tetanus (1C14)  
                                            Tetanus neonatorum (1C15)

**1C14****Obstetrical tetanus**

A disease caused by an infection with the gram-positive bacteria *Clostridium tetani*. This disease is characterised by a prolonged contraction of skeletal muscle fibres during pregnancy or within six weeks of termination of pregnancy. Transmission is by direct contact.

**1C15****Tetanus neonatorum**

A disease affecting neonates, caused by an infection with the gram-positive bacteria *Clostridium tetani*. This disease is characterised by systemic muscle spasms that arise within the first few days after delivery. Transmission is commonly by direct contact or lack of maternal immunity.

**1C16****Gas gangrene**

Gas gangrene or clostridial myonecrosis is a potentially fatal, rapidly progressive necrotizing infection of muscle and soft tissue resulting from bacterial invasion of healthy muscle from adjacent traumatized muscle or soft tissue. The infection originates in a wound contaminated with bacteria of the genus *Clostridium*. *C. perfringens* accounts for the majority of cases (over eighty percent), while *C. novyi*, *C. septicum*, and *C. histolyticum* cause most of the other cases.

**1C17****Diphtheria**

A disease commonly of the respiratory system, caused by an infection of the gram-positive bacteria *Corynebacterium diphtheriae*. This disease is characterised by sore throat, fever, and a pseudomembrane on the tonsils, pharynx, or nasal cavity. Transmission is by inhalation of infected respiratory secretions, or direct cutaneous contact. Confirmation is by identification of *Corynebacterium diphtheriae* from a throat swab or infected tissue, and by clinical signs.

**1C17.0****Pharyngeal or tonsillar diphtheria**

**Inclusions:** Diphtheritic membranous angina

**1C17.00**

Postdiphtheritic paralysis of uvula

**1C17.0Y**

Other specified pharyngeal or tonsillar diphtheria

**1C17.0Z**

Pharyngeal or tonsillar diphtheria, unspecified

**1C17.1****Nasal diphtheria****1C17.2****Laryngeal diphtheria**

localised infection of mucous membranes of the larynx caused by toxigenic strains of *Corynebacterium diphtheriae*; it is characterised by the presence of a pseudomembrane at the site of infection; diphtheria toxin, produced by *C. diphtheriae*, can cause myocarditis, polyneuritis, and other systemic toxic effects.

**Inclusions:** Diphtheritic laryngotracheitis

**1C17.3****Cutaneous diphtheria**

**Exclusions:** Erythrasma (1C44)

**1C17.Y****Other specified diphtheria****1C17.Z****Diphtheria, unspecified****1C18****Brazilian purpuric fever**

A disease affecting children, caused by an infection with the gram-negative bacteria *Haemophilus aegyptius*. This disease is characterised by fever, nausea, vomiting, purpuric lesions, and sepsis, that is preceded by conjunctivitis. Transmission may be by mechanical transmission from infected eye gnats, contact with discharge from infected individuals, or fomites used near the eyes. Confirmation is by identification of *Haemophilus influenzae* from blood.

**Inclusions:** Systemic *Haemophilus aegyptius* infection

**1C19****Legionellosis**

Legionellosis varies in severity from a mild febrile illness to a serious and sometimes fatal form of pneumonia and is caused by exposure to *Legionella* species found in water, and potting mixes.

Legionellosis is a generic term describing the pneumonic and non-pneumonic forms of infection with *Legionella*.

**1C19.0****Nonpneumonic Legionnaires' disease**

The non-pneumonic form (Pontiac fever) is an acute, self-limiting flu-like illness usually lasting 2–5 days. The incubation period is from a few and up to 48 hours. The main symptoms are fever, chills, headache, malaise and muscle pain (myalgia).

**1C19.1****Legionnaires disease**

Legionnaires' disease, the pneumonic form, has an incubation period of 2 to 10 days (but up to 16 days has been recorded in some outbreaks). Initially, symptoms are fever, loss of appetite, headache, malaise and lethargy. Some patients may also have muscle pain, diarrhoea and confusion. There is also usually an initial mild cough, but as many as 50% of patients can present phlegm. Blood-streaked phlegm or hemoptysis occurs in about one-third of the patients. The severity of disease ranges from a mild cough to a rapidly fatal pneumonia. Death occurs through progressive pneumonia with respiratory failure and/or shock and multi-organ failure.

**1C19.Z****Legionellosis, unspecified****1C1A****Listeriosis**

A disease caused by an infection with the gram-positive bacteria *Listeria*. This disease commonly presents with fever and muscle aches, followed by gastrointestinal symptoms.

**Inclusions:** listerial foodborne infection

**Coded Elsewhere:** Neonatal listeriosis (KA61.1)

**1C1A.0****Cutaneous listeriosis**

This is a bacterial infection caused by a Gram-positive, motile bacterium, *Listeria monocytogenes*. Listeriosis occurs primarily in newborn infants, elderly patients, and patients who are immunocompromised.

**1C1A.1****Listerial meningitis or meningoencephalitis**

A disease of the meninges or brain, caused by an infection with the gram-positive bacteria *Listeria*. This disease is characterised by fever, headache, or neurological deficits. Transmission is through haematogenous spread to the meninges from ingestion of contaminated food. Confirmation is by identification of *Listeria* from cerebrospinal fluid.

**1C1A.Y****Other specified listeriosis****1C1A.Z****Listeriosis, unspecified**

**1C1B****Nocardiosis**

A disease caused by an infection with the gram-positive bacteria *Nocardia*. This disease presents with symptoms depending on the site of infection (commonly lung, brain, or skin). Transmission is by inhalation of *Nocardia* from soil or water, or by direct cutaneous contact. Confirmation is by identification of *Nocardia* in samples from affected sites.

**1C1B.0****Pulmonary nocardiosis**

A disease of the respiratory system, caused by an infection with the gram-positive bacteria *Nocardia*. This disease is characterised by chest pain, haemoptysis, fever, weight loss, and cough. Transmission is by inhalation of *Nocardia* from soil or water. Confirmation is by identification of *Nocardia* in sputum samples, or lung biopsy.

**1C1B.1****Cutaneous nocardiosis**

Cutaneous nocardiosis may be due to direct infection of the skin where it presents either as a solitary cold abscess or as a lymphangitic process in which infection spreads up lymphatic channels to form a linear array of suppurative nodules. Skin involvement is also present in a third of cases of systemic nocardiosis.

**Exclusions:** Actinomycetoma due to *Nocardia* species (1C43)

**1C1B.Y****Other specified forms of nocardiosis****1C1B.Z****Nocardiosis, unspecified****1C1C****Meningococcal disease**

This illness is severe and includes infections of the lining of the brain and spinal cord (meningitis) and generalised bloodstream infections (bacteraemia with or without sepsis).

Meningococcus bacteria are spread through the exchange of respiratory and throat secretions like spit (e.g., by living in close quarters, kissing). Meningococcal disease can be treated with antibiotics, but quick medical attention is extremely important. Keeping up to date with recommended vaccines is the best defence against meningococcal disease.

**Inclusions:** Meningococcal infection

**1C1C.0****Meningococcal meningitis**

A condition of the meninges, caused by an infection with the gram-negative bacteria *Neisseria meningitidis*. This condition is characterised by high fever, stiff neck, severe headache, vomiting, purpura, photophobia, and sometimes chills, altered mental status, or seizures. Transmission is through haematogenous spread to the meninges after droplet transmission or direct contact. Confirmation is by identification of *Neisseria meningitidis* in CSF (cerebrospinal fluid), for example, by agglutination test or polymerase chain reaction.

**Inclusions:** Meningitis due to *Neisseria meningitidis*

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>1C1D.0</b> | <p><b>Primary yaws</b></p> <p>Primary yaws results from primary inoculation of <i>Treponema pallidum</i> subsp. <i>pertenue</i> into the skin, manifesting 2-12 weeks later as a localised papule (initial, primary or 'mother' yaw) before developing into a large non-tender ulcerating nodule, often resembling a raspberry (hence the name 'framboesia'). The primary lesion is most commonly located on the legs and ankles may also be found on the buttocks, arms, hands, and face. It usually heals after 3–6 months and is still present at the onset of the secondary stage in only a minority (9-15%).</p> <p><b>Inclusions:</b>                      Chancre of yaws<br/>                                                    Primary framboesia</p> |
| <b>1C1D.1</b> | <p><b>Secondary yaws</b></p> <p>Secondary yaws results from lymphatic and haematogenous spread of <i>Treponema pallidum</i> subsp. <i>pertenue</i> spirochaetes from the initial inoculation site and appears from a few weeks to 2 years after the primary infection. The commonest initial symptoms are non-specific and include arthralgia and malaise. Secondary skin lesions consist of multiple papules and nodules similar to the initial lesion but smaller. They may be localised, regional or generalised; they may ulcerate and on moist areas may mimic syphilitic condylomata lata. Hyperkeratotic plaques on the palms and soles may develop painful fissures and secondary infection, resulting in a characteristic 'crab-like' gait.</p>        |
| <b>1C1D.2</b> | <p><b>Tertiary yaws</b></p> <p>Tertiary yaws develops in &lt;10% of untreated infected individuals after an interval of 5 years or more. The late stage skin lesions are characterised by gummatous nodules with necrotic tissue destruction, followed by debilitating scarring and contracture. Destructive osteitis can result in ulceration of the palate and nasopharynx ('gangosa'), or bowing of the tibia (sabre shins). Hypertrophic periostitis at periarticular sites can lead to exostosis of the paranasal maxillae ('goundou').</p>                                                                                                                                                                                                                |
| <b>1C1D.3</b> | <p><b>Latent yaws</b></p> <p>Latent yaws is defined as yaws with no clinical signs and only serological evidence of infection (reactive treponemal and non-treponemal tests). Infectious relapses may occur in latent cases for up to 5 and, rarely, 10 years. The total duration of infectivity for an untreated yaws patient, including relapses, is thought to be about 12-18 months.</p> <p><b>Inclusions:</b>                      Yaws without clinical manifestations, with positive serology</p>                                                                                                                                                                                                                                                        |
| <b>1C1D.Z</b> | <p><b>Yaws, unspecified</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**1C1E.1 Intermediate lesions of pinta**

The intermediate stage of pinta develops months to years after the primary stage and is characterised by more extensive lesions (known as pintids) which gradually change from pink to blue, black or grey and become atrophic.

**Inclusions:** Pintids

**1C1E.2 Late lesions of pinta**

Late lesions of pinta are confined to the skin and are characterised by dyschromia and atrophy. They typically take between two and four years to develop following initial infection. The skin appears mottled and atrophic with numerous irregular and variegated hypermelanotic, hypomelanotic and amelanotic patches typically involving the wrists, palms, ankles, and elbows, as well as the skin around and within old lesions.

**Inclusions:** Hypomelanosis due to late pinta

**1C1E.3 Mixed lesions of pinta****1C1E.Z Pinta, unspecified****1C1F Endemic non-venereal syphilis**

Endemic non-venereal syphilis is caused by *Treponema pallidum* subspecies endemicum and is transmitted by skin-to-skin or mouth-to-mouth contact rather than sexual contact. Children are at greatest risk of infection. Clinical features are similar to venereal syphilis with a primary ulcer (usually in the mouth or on the nipples of breast-feeding women nursing infected children) and, in the secondary stage, a generalised papular rash, oral mucous patches, condylomata lata and generalised lymphadenopathy. Late stage infection is characterised by destructive gummata of the nasopharynx (gangosa), bones and skin.

**Inclusions:** Bejel  
Endemic syphilis  
Njovera

**1C1G Lyme borreliosis**

A tick-borne infection by the spirochaete *Borrelia burgdorferi*. Lyme borreliosis typically presents with a characteristic rash, erythema chronicum migrans, at an average of seven days after a bite from an infected tick. The rash may be accompanied by flu-like symptoms. Disseminated infection may cause meningitis, cranial neuropathies and carditis amongst other manifestations. Late disease, months to years after initial infection, may present with a pauciarticular arthritis or with encephalomyelitis.

**Coding Note:** Use additional code if desired, to identify any associated condition.

Use additional code, if desired, to identify any sequelae. The extension code 'Cause of late effect' is used in addition to both codes to show the relationship between the causative condition and the resulting sequelae.

**1C1G.0 Early cutaneous Lyme borreliosis**

*Borrelia burgdorferi* infection involving the skin, typically as erythema migrans, the commonest presentation of Lyme disease.

**Coding Note:** Use additional code if desired, to identify any associated condition.

|                     | Necrotising ulcerative gingivitis (NUG) is a condition affecting the gums that is caused by a bacterial infection. It is a form of periodontal (gum) disease. But unlike other forms, it typically develops quickly and causes moderate to severe pain. "Necrotising" means that the condition destroys tissue. "Ulcerative" refers to sores that can appear on the gums. |

**1C1J.0****Tick-borne relapsing fever**

A disease caused by an infection with the bacteria *Borrelia*. This disease is characterised by repeated episodes of fever, with the febrile episode lasting for approximately 3 days, followed by the afebrile state of approximately 7 days. Transmission is through the bite of an infected soft tick (from the genus *Ornithodoros*). Confirmation is by identification of spirochete bacteria from a blood smear, bone marrow, or cerebrospinal fluid.

**Inclusions:** Relapsing fever due to any *Borrelia* species other than *Borrelia recurrentis*

**1C1J.1****Louse-borne relapsing fever**

A spirochaetal infection caused by the human to human transmission of *Borrelia recurrentis* by the human body louse. Epidemics are associated with poor living conditions as may result from famine or war. Episodic fever may progress to severe jaundice, haemorrhage, confusion and death. Confirmation is by identification of *Borrelia* in blood films.

**Inclusions:** Relapsing fever due to *Borrelia recurrentis*

**1C1J.Z****Relapsing fever, unspecified**

Other diseases due to chlamydiae (1C20-1C2Z)

**1C20****Chlamydial conjunctivitis**

Chlamydial conjunctivitis is a sexually transmitted infection of conjunctiva caused by bacteria *Chlamydia trachomatis*. Bacteria can be passed from an infected mother to baby during vaginal childbirth. The symptoms include that one or both eyes will be red with a sticky discharge and swollen eyelids.

**Inclusions:** Paratrachoma

**1C21****Chlamydial peritonitis**

This is a sexually transmitted infection that causes an inflammation of the peritoneum, the thin tissue that lines the inner wall of the abdomen and covers most of the abdominal organs.

**1C22****Infections due to *Chlamydia psittaci***

Any condition caused by an infection with the gram-negative bacteria *Chlamydia psittaci*. These conditions are characterised by variable clinical presentations such as fever, cough, headaches, chills, fatigue, nausea, vomiting, diarrhoea, or pneumonia. Transmission is commonly by inhalation of aerosol contaminated with body fluids from infected birds, or direct contact with infected birds. Confirmation is by identification of *Chlamydia psittaci*.

**Inclusions:** Psittacosis  
Ornithosis  
Parrot fever

**Coded Elsewhere:** Pneumonia in chlamydia psittaci infection (CA40.0Y)

**1C23****Trachoma**

A disease caused by an infection with the gram-negative bacteria *Chlamydia trachomatis*. This disease is characterised by a roughening of the inner surfaces of the eyes, and inflammation that may lead to superficial vascularization of the cornea (pannus) and scarring of the conjunctiva. Long term effects include blindness or other visual impairments. Transmission is by direct or indirect contact with the eyes or nose of an infected individual.

**1C23.0****Initial stage of trachoma**

This refers to the initial stage of an infectious disease caused by the *Chlamydia trachomatis* bacterium which produces a characteristic roughening of the inner surface of the eyelids.

**Inclusions:** Trachoma dubium

**1C23.1****Active stage of trachoma**

This refers to the active stage of an infectious disease caused by the *Chlamydia trachomatis* bacterium which produces a characteristic roughening of the inner surface of the eyelids.

**1C23.Y****Other specified trachoma****1C23.Z****Trachoma, unspecified****1C2Y****Other specified diseases due to chlamydiae****1C2Z****Diseases due to chlamydiae, unspecified**

## Rickettsioses (1C30-1C3Z)

Any disease caused by an infection with the gram-negative bacteria *Rickettsia*. These diseases commonly present with fever, malaise, and rash. Transmission is commonly through the bite of an infected flea, louse, mite, or tick.

**Coded Elsewhere:** Trench fever (1C11.1)

**1C30****Typhus fever**

A disease caused by an infection with the gram-negative bacteria *Rickettsia*. This disease is characterised by fever, delirium, back pain, or arthralgia. Transmission is commonly through the bite of an infected flea, louse, mite, or tick.

**Exclusions:** Rickettsiosis due to *Ehrlichia sennetsu* (1C30-1C3Z)

**1C30.0****Epidemic louse-borne typhus fever due to *Rickettsia prowazekii***

This is a form of typhus so named because the disease often causes epidemics following wars and natural disasters. The causative organism is *Rickettsia prowazekii*, transmitted by the human body louse (*Pediculus humanus corporis*). This diagnosis is due to a species of gram-negative, obligate intracellular parasitic, aerobic bacteria (belonging to the class Alphaproteobacteria) that is the aetiologic agent of epidemic typhus, transmitted in the faeces of lice.

|               | An acute febrile disease caused by <i>Rickettsia akari</i> , which is transmitted from its rodent host by the house-mouse mite <i>Liponyssoides sanguineus</i> . An initial skin lesion at the site of a mite bite, often associated with lymphadenopathy, is followed by fever; a disseminated skin rash appears, which generally does not involve the palms and the soles, and lasts only a few days. Death is uncommon. |
|               | <b>Inclusions:</b> Kew Gardens spotted fever                                                                                                                                                                                                                                                                                                                                                                               |

**1C33****Q fever**

A disease caused by an infection with the gram-negative bacteria *Coxiella burnetii*. This disease is characterised by fever, or may be asymptomatic. Transmission is by inhalation of the bacteria, contact with contaminated milk, urine, faeces, vaginal mucus, or semen of infected animals, or through the bite of an infected tick.

**Inclusions:** Nine Mile fever  
Infection due to *Coxiella burnetii*  
Quadrilateral fever

**1C3Y****Other specified rickettsioses****1C3Z****Rickettsioses, unspecified****1C40****Campylobacteriosis**

Campylobacteriosis is caused by *Campylobacter* bacteria (curved or spiral, motile, non-spore-forming, Gram-negative rods). The disease is usually caused by *C. jejuni*, a spiral and comma shaped bacterium normally found in cattle, swine, and birds, where it is nonpathogenic, but the illness can also be caused by *C. coli* (also found in cattle, swine, and birds), *C. upsaliensis* (found in cats and dogs) and *C. lari* (present in seabirds in particular).

**1C41****Bacterial infection of unspecified site**

**Exclusions:** meningococcal infection NOS (1C1C)  
chlamydial infection NOS (1C20-1C2Z)  
rickettsial infection NOS (1C30-1C3Z)  
spirochaetal infection NOS (1C10-1C4Z)  
Infection arising from device, implant or graft, not elsewhere classified (NE83.1)

**Coded Elsewhere:** Acute meningococcaemia (1C1C.20)  
Disseminated gonococcal infection (1A73)

**1C42****Melioidosis**

A disease caused by the saprophytic environmental gram-negative bacterium *Burkholderia pseudomallei* which is found in soil or water in humid tropical regions of the world, especially South-East Asia and northern Australia. It has protean manifestations ranging from fulminant septicaemia with fatal outcome to chronic low grade infection.

**1C43****Actinomycetoma**

Actinomycetoma is a chronic progressive subcutaneous infection caused by implantation of aerobic branching actinomycetes through a skin wound. These organisms are filamentous bacteria which live as saprophytes in soil or on plants; the commonest infecting agents are *Nocardia brasiliensis*, *Actinomadura madurae* and *Streptomyces somaliensis*. The earliest stage of infection is a firm painless nodule but with time the whole area becomes hard and swollen with multiple papules, pustules and draining sinuses on the skin surface. Extension to underlying bones and joints can result in gross deformity.

**Inclusions:** Mycetoma due to filamentous bacteria

**Exclusions:** Eumycetoma (1F29)

**1C44****Non-pyogenic bacterial infections of the skin**

Skin infection by bacteria which do not characteristically induce pus formation.

**1C45****Toxic shock syndrome**

**Exclusions:** endotoxic shock NOS (1G41)

**1C45.0 Streptococcal toxic shock syndrome**

**1C45.1 Staphylococcal toxic shock syndrome**

**1C45.Y Toxic shock syndrome due to other specified infectious agent**

**1C45.Z Toxic shock syndrome without specified infectious agent**

**1C4Y****Other specified bacterial diseases****1C4Z****Unspecified bacterial disease**

## Human immunodeficiency virus disease (1C60-1C62.Z)

A case of HIV infection is defined as an individual with HIV infection irrespective of clinical stage including severe or stage 4 clinical disease (also known as AIDS) confirmed by laboratory criteria according to country definitions and requirements.

**Coded Elsewhere:** Congenital human immunodeficiency virus infection (KA62.6)

**1C60****Human immunodeficiency virus disease associated with tuberculosis**

**Coded Elsewhere:** Human immunodeficiency disease complicating pregnancy, childbirth or the puerperium (JB63.7)

**1C60.0 HIV disease clinical stage 1 associated with tuberculosis**

**Coded Elsewhere:** Human immunodeficiency virus disease associated with generalised lymphadenopathy (1C62.0)

Acute human immunodeficiency virus infection syndrome (1C62.0)

## Viral infections of the central nervous system (1C80-1C8Z)

Any disease of the central nervous system, caused by an infection with a viral source.

**Coded Elsewhere:** Progressive multifocal leukoencephalopathy (8A45.02)

Enteroviral exanthematous fever (1F05.2)

Herpes simplex meningitis (1F00.20)

Subacute sclerosing panencephalitis (8A45.01)

West Nile virus infection (1D46)

Colorado tick fever (1D41)

Zoster meningitis (1E91.3)

### 1C80

#### Viral encephalitis, not elsewhere classified

**Coded Elsewhere:** Western equine encephalitis (1C83)

Eastern equine encephalitis (1C84)

Venezuelan equine encephalitis (1C8C)

Argentinian haemorrhagic fever (1D61.0)

Bolivian haemorrhagic fever (1D61.1)

Lassa fever (1D61.2)

La Crosse encephalitis (1C8D)

Oropouche virus disease (1D43)

Japanese encephalitis (1C85)

St Louis encephalitis (1C86)

Rocio viral encephalitis (1C87)

Murray Valley encephalitis (1C88)

Tick-borne encephalitis (1C8G)

Encephalitis due to herpes simplex virus (1F00.21)

Encephalitis due to mumps virus (1D80.3)

Varicella encephalitis (1E90.2)

Measles complicated by encephalitis (1F03.1)

Sequelae of viral encephalitis (1G84)

### 1C81

#### Acute poliomyelitis

A disease of the nervous system, caused by human poliovirus. This disease commonly presents with a fever, sore throat, headache, vomiting, or stiffness of the neck and back. This disease may present with an acute onset of flaccid paralysis. Transmission is commonly by the faecal-oral route or direct contact. Confirmation is by identification of poliovirus in a faecal sample or by a lumbar puncture.

**1C8E****Viral meningitis, not elsewhere classified**

Any disease of the meninges, caused by an infection with a viral source.

**Coded Elsewhere:** Meningitis due to mumps virus (1D80.2)

Measles complicated by meningitis (1F03.2)

Herpes simplex meningitis (1F00.20)

Varicella meningitis (1E90.1)

Neonatal meningitis (KA65.4)

Meningitis due to human immunodeficiency virus (1C62.2)

Meningitis due to rubella virus (1F02.0)

Meningitis due to Arenavirus (1D61.Y)

Zoster meningitis (1E91.3)

Viral meningitis due to Epstein-Barr virus (1D81.0)

Viral meningitis due to Cytomegalovirus (1D82.Y)

**1C8E.1****Enteroviral meningitis**

A disease of the meninges, caused by an infection with enterovirus. This disease is characterised by high fever, headache, vomiting, nausea, stiff neck, photophobia, drowsiness, skin rash, confusion, seizures, or loss of consciousness. This disease may be asymptomatic in older adults. Transmission is through haematogenous spread to the meninges. Confirmation is by identification of enterovirus through a lumbar puncture, by agglutination tests, or by polymerase chain reaction.

**1C8E.2****Meningitis due to adenovirus**

A disease of the meninges, caused by an infection with adenovirus. This disease is characterised by high fever, headache, vomiting, nausea, stiff neck, photophobia, drowsiness, skin rash, confusion, seizures, or loss of consciousness. This disease may be asymptomatic in older adults. Transmission is through haematogenous spread to the meninges. Confirmation is by identification of adenovirus through a lumbar puncture, by agglutination tests, or by polymerase chain reaction.

**1C8E.Y****Other specified viral meningitis, not elsewhere classified****1C8E.Z****Viral meningitis, unspecified****1C8F****Lymphocytic choriomeningitis**

A disease of the meninges, caused by an infection with lymphocytic choriomeningitis virus. This disease is characterised by fever, stiffness of the neck, malaise, lack of appetite, myalgia, headache, nausea, vomiting, or is asymptomatic. This disease may also present with cough, sore throat, arthralgia, testicular pain, or parotid pain. Transmission is by direct contact with body fluids from an infected rodent, through the bite of an infected rodent, or by droplet transmission. Confirmation is by identification of lymphocytic choriomeningitis virus in a blood or tissue sample.

**Exclusions:** Encephalitis due to Lymphocytic choriomeningitis virus (1D61)  
meningoencephalitis due to Lymphocytic choriomeningitis virus (1D61)

**1C8G****Tick-borne encephalitis**

**1D03****Infectious abscess of the central nervous system**

A focal suppurative process of the brain parenchyma, the intracranial or spinal epidural or subdural space, and less commonly the spinal cord parenchyma. The suppurative process is most commonly associated with bacterial infection, and occasionally with fungal, protozoal, or parasitic infection. Brain abscesses develop most commonly by spread from a contiguous infected site (ear, paranasal sinuses, mastoid air cells, teeth), craniofacial osteomyelitis, and following open head trauma or previous neurosurgical procedure. Haematogenous spread from purulent pulmonary infections, bacterial endocarditis, or other sites of infection can also cause brain abscess. Patients with intracranial abscess present with variable combinations of headache, altered mental status, focal deficits, and seizures. Fever may be present. Patients with intraspinal abscess present with variable degrees of paraparesis or quadriparesis, sensory impairment below the level of the lesion, altered sphincter function, and back pain. The diagnosis is made by CT or MRI imaging, and may be confirmed by histological examination and culture of the abscess material following neurosurgical drainage. Lumbar puncture is usually contraindicated.

**1D03.3 Intracranial abscess**

A condition of the cranial cavity, caused by an infection with a bacterial, viral, or fungal source. This condition is characterised by a focal accumulation of purulent material within the cranial cavity. This condition may present with fever, headache, and focal neurological deficits.

| <b>1D03.33</b> | <p>Multiple or widespread intracranial abscess</p> <p>Multiple focal suppurative infections within the cranial cavity, including the epidural and subdural spaces, or in the brain, brainstem or cerebellum. The abscesses are typically surrounded by a vascularised capsule. Cerebritis describes nonencapsulated brain abscesses. The infective agent may be bacterial, fungal, or parasitic. The signs and symptoms are variable but typically present as an expanding mass lesion, over a variable period of time, with headache, fever, and a focal neurologic deficit. Seizures may occur. Diagnosis is made by neuroimaging and microbiological testings as Gram stain and culture of abscess material.</p> <p><b>Coding Note:</b> Code also the causing condition</p> |

## Dengue (1D20-1D2Z)

Dengue is a viral disease transmitted by the bite of a mosquito infected by dengue viruses. It is one disease entity with different clinical presentations and often with unpredictable clinical evolution and outcome. Most patients recover following a self-limiting non-severe clinical course like nausea, vomiting, rash, aches and pains, but a small proportion progress to severe disease, mostly characterised by plasma leakage with or without haemorrhage, although severe haemorrhages or severe organ impairment can occur, with or without dengue shock.

### 1D20

#### Dengue without warning signs

**Inclusions:** Dengue haemorrhagic fever Grade 1  
Dengue fever without warning signs  
Dengue haemorrhagic fever without warning signs

### 1D21

#### Dengue with warning signs

Clinical warning signs are: abdominal pain or tenderness, mucosal bleeding, lethargy and/or restlessness, rapid decrease in platelet count, increase in haematocrit. Other signs can include: persistent vomiting, visible fluid accumulation, liver enlargement more than 2 cm.

### 1D22

#### Severe dengue

Clinical signs include: 1. Severe plasma leakage leading to shock (dengue shock syndrome - DSS) and/or fluid accumulation with respiratory distress; 2. severe bleeding as evaluated by clinician, 3. severe organ involvement: Liver AST or ALT  $\geq$  1000, CNS: impaired consciousness, involvement of other organs, as myocarditis or nephritis.

Severe conditions may also present with increasing fever, jaundice, renal failure, or bleeding. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgM anti-yellow fever virus antibodies in a serum sample.                                                            |
| 1D48 | <b>Zika virus disease</b><br>Zika virus infection is caused by the bite of an infected Aedes mosquito. The most common symptoms of Zika virus infection are mild fever and exanthema (skin rash), usually accompanied by conjunctivitis, muscle or joint pain, and general malaise that begins 2-7 days after the bite of the infected mosquito.<br><i>Coded Elsewhere:</i> Congenital Zika virus infection (KA62.0)                                                                                                     |

**1D49****Crimean-Congo haemorrhagic fever**

A disease caused by an infection with Crimean-Congo haemorrhagic fever virus. The incubation period ranges from 2 to 9 days. Symptoms/signs typically include high fever, headache, malaise, arthralgia, myalgia, nausea, abdominal pain, and rarely diarrhoea. Early signs typically include fever, hypotension, conjunctivitis, and cutaneous flushing or a skin rash. Later, patients may develop signs of progressive haemorrhagic diathesis, such as petechiae, mucous membrane and conjunctival haemorrhage, haematuria, hematemesis, and melena. Lethality may reach 30%. Transmission occurs via bites of infected ticks, by direct contact with infected animal blood, or iatrogenic transmission. Laboratory diagnosis of the infection during the acute phase of illness consists of detection of viral nucleic acid or by isolation of the virus or by demonstration of viral antigen by enzyme-linked immunoassay from serum or plasma samples. In samples collected later during the illness, diagnosis is confirmed by demonstration of specific IgG and IgM antibodies.

**1D4A****Omsk haemorrhagic fever**

A disease caused by an infection with the Omsk haemorrhagic fever virus. This disease is characterised by fever, chills, headache, gastrointestinal symptoms and bleeding, or muscle pain with vomiting. In severe cases, this disease may also present with encephalitis. Transmission is through the bite of an infected tick, by direct contact with an infected animal, by the faecal-oral route from an infected animal, or by ingestion of milk from infected goats or sheep. Confirmation is by detection of anti-Omsk haemorrhagic fever virus antibodies in a serum sample.

**1D4B****Kyasanur Forest disease**

A disease caused by an infection with Kyasanur Forest disease virus. This disease commonly presents with fever, chills, headache, muscle pain and vomiting, or gastrointestinal symptoms and bleeding. This disease may also present with neurological manifestations such as a severe headache, mental disturbances, tremors, or vision deficits. Transmission is through the bite of an infected tick or by direct contact with an infected animal. Confirmation is by identification of Kyasanur Forest disease virus in a serum sample.

**1D4C****Alkhurma haemorrhagic fever****1D4D****Ross River disease**

A disease caused by an infection with Ross River disease virus. This disease is characterised by arthralgia, with or without arthritis. This disease may also present with fever, fatigue, headache, swollen glands, arthralgia, or maculopapular rash commonly affecting the limbs and trunks. Transmission is through the bite of an infected mosquito. Confirmation is by detection of IgM or IgG anti-Ross River disease virus antibodies in a serum sample.

**Inclusions:** Epidemic polyarthritis and exanthema  
Ross River fever

Encephalitis due to Arenavirus (1D61.Y)

### 1D60

#### Filovirus disease

A severe disease with high lethality caused by filovirus infection. Filovirus disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Hiccups may occur. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure, spontaneous abortion in pregnant women when infected. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis sometimes followed by cataract formation), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).

### 1D60.0

#### Ebola disease

A severe disease with high case fatality caused by infection with Ebola virus or a closely related virus. Ebola disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Hiccups may occur. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure, spontaneous abortion in infected pregnant women. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis sometimes followed by cataract formation), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days).

| <b>Coding Note:</b> | This code should be used in conjunction with codes that identify the causative virus. Unusual manifestations of disease include organ-specific (e.g. meningoencephalitis) or systemic inflammatory syndromes associated with viral recrudescence occurring after clinical recovery from acute disease. These manifestations may occur several months following infection. Additionally, this code may be used for unusual presentations of acute disease not included in the general description of Ebola disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>1D60.1</b>       | <b>Marburg disease</b><br>A severe disease with high case fatality caused by infection with Marburg virus or a closely related virus. Marburg disease is typically characterised by acute onset of fever with non-specific symptoms/signs (e.g., abdominal pain, anorexia, fatigue, malaise, myalgia, sore throat) usually followed several days later by nausea, vomiting, diarrhoea, and occasionally a variable rash. Severe illness may include haemorrhagic manifestations (e.g., bleeding from puncture sites, ecchymoses, petechiae, visceral effusions), encephalopathy, shock/hypotension, multi-organ failure. Common laboratory findings include thrombocytopenia, elevated transaminase concentrations, electrolyte abnormalities, and signs of renal dysfunction. Individuals who recover may experience prolonged sequelae (e.g., arthralgia, neurocognitive dysfunction, uveitis), and clinical and subclinical persistent infection may occur in immune-privileged compartments (e.g., CNS, eyes, testes). Person-to-person transmission occurs by direct contact with blood, other bodily fluids, organs, or contaminated surfaces and materials with risk beginning at the onset of clinical signs and increasing with disease severity. Family members, sexual contacts, healthcare providers, and participants in burial ceremonies with direct contact with the deceased are at particular risk. The incubation period typically is 7–11 days (range ≈2–21 days). |
| <b>1D60.10</b>      | Marburg virus disease<br>Marburg disease caused by Marburg virus or Ravn virus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Coding Note:</b> | This code should be used in conjunction with codes that identify the causative virus. Unusual manifestations of disease include organ-specific (e.g. orchitis, uveitis) or systemic inflammatory syndromes associated with viral recrudescence occurring after clinical recovery from acute disease. These manifestations may occur several months following infection. Additionally, this code may be used for unusual presentations of acute disease not included in the general description of Marburg disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**1D60.Z**                      **Filovirus disease, virus unspecified**

**1D61**                      **Arenavirus disease**

**Coded Elsewhere:** Lymphocytic choriomeningitis (1C8F)

**1D61.0**                      **Argentinian haemorrhagic fever**

A disease endemic to the Argentine Pampas that is caused by an infection with Junín virus and that is characterised by haemorrhagic and neurological manifestations and high lethality (10-30%). The disease begins with a 6-14 day-lasting prodromic phase. Argentinian haemorrhagic fever presents with fever, myalgia, erythema, conjunctival injection, non-menstrual uterine bleeding, epistaxis, haematemesis, melena, haematuria, or shock. Around 20-30% of patients advance to a neurological and haemorrhagic phase. Survivors have a long convalescence period. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Junín virus from blood or mucosal secretions samples.

**1D61.1**                      **Bolivian haemorrhagic fever**

A disease endemic to Bolivia that is caused by an infection with Machupo virus. Early disease symptoms/signs include fever, mild hypertension, headache, bleeding gums, and fatigue. Advanced signs include mucous membrane haemorrhage, epistaxis, melaena, and neurological damage such as tremors, seizures, loss of muscle control, and coma. Onset of disease symptoms occurs usually within seven days of infection. The lethality ranges from 18% to 22%. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Machupo virus from blood or mucosal secretions samples.

**1D61.2**                      **Lassa fever**

A disease endemic in large parts of sub-Saharan Western Africa caused by infection with Lassa virus. Infection is mild or asymptomatic in most cases, but can cause severe illness or death. After a prodromal period of 7-10 days (sometimes longer), initial symptoms/signs include fever, malaise, headache, sore throat, vomiting, abdominal pain, and diarrhoea. Subsequently, patients develop high fever, extreme lethargy, oedema of head/neck, encephalopathy, pleural effusion, and ascites. Bleeding into the skin, mucosae and underlying tissues occurs in the severest cases. Deafness occurs in many patients, and the disease is often particularly severe in pregnancy. The overall lethality can reach 15% even among hospitalized patients receiving supportive care. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Lassa virus in blood samples by molecular or serologic methods.

|               | A disease mainly found in rural areas of central Venezuela that is caused by an infection with Guanarito virus. Symptoms/signs among patients include fever, malaise, headache, arthralgia, sore throat, vomiting, abdominal pain, diarrhoea, convulsions, and a variety of haemorrhagic manifestations. The majority of patients also develop leukopenia and thrombocytopenia. The overall lethality may reach 30% even in hospitalised patients receiving supportive care. Transmission occurs by inhalation, consumption, or direct contact with excretions and bodily fluids from infected rodents. Diagnosis occurs by identification of Guanarito virus from blood or mucosal secretions samples.                                                                            |

|               | An acute zoonotic viral disease characterised by abrupt onset of fever, influenza-like clinical signs (e.g., chills, headache, myalgia, dry cough), gastrointestinal signs (e.g., diffuse abdominal pain, vomiting, diarrhoea), transient troubled vision (acute myopia), lumbalgia due to renal swelling, haemorrhagic manifestations to various degrees sometimes followed by rapidly increasing dyspnoea due to not-cardiogenic acute lung oedema, and/or renal involvement. The latter is characterised by initial, often massive proteinuria and microhaematuria sometimes accompanied by transient renal function impediment. All hantavirus infections are heralded by varying degrees of transient thrombocytopenia, which may serve as an indicator of clinical severity. |

|               | A disease of the respiratory system, caused by infection with certain hantaviruses. This disease is characterised by fever, fatigue, myalgia, headache, chills, nausea, vomiting, diarrhoea, or abdominal pain. This disease may also present with coughing and dyspnoea. Transmission is by the faecal-oral route or airborne transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|               | Acute bat-borne disease characterised by fever and headaches. The disease may progress to drowsiness, disorientation, mental confusion, and finally encephalitis (brain swelling) in less than a week. This progression may occur with or without an acute respiratory distress component. The incubation period ranges from 4 to 14 days. Lethality is high.                                                                                                                                                                                                                                                                                                                                                                                                                      |

**1D64**

**Middle East respiratory syndrome**

A disease caused by an infection with Middle East Respiratory Syndrome coronavirus (MERS-CoV). This disease is characterised by severe acute respiratory illness with fever, cough, and shortness of breath. Confirmation is by identification of Middle East Respiratory Syndrome coronavirus from genetic material.

**1D65**

**Severe acute respiratory syndrome**

A disease of the respiratory system, caused by an infection with coronavirus. This disease is characterised by fever, headache, cough, myalgia, tachycardia, or diarrhoea. This disease may also lead to pneumonia. Transmission is by direct contact, inhalation of infected respiratory secretions, or airborne transmission. Confirmation is by identification of coronavirus in a blood, stool, respiratory secretions, or body tissue sample.

**Exclusions:** COVID-19, virus identified (RA01.0)  
COVID-19, virus not identified (RA01.1)

**Coded Elsewhere:** Congenital Varicella Zoster virus infection (KA62.2)

Other viral diseases complicating pregnancy, childbirth or the puerperium (JB63.5)

Viral duodenitis (DA51.6Y)

Tahyna fever (1D4Y)

**1D80**

**Mumps**

A disease caused by an infection with mumps virus. This disease commonly presents with fever, headache, fatigue, or eventually parotitis. Transmission is by contact with respiratory secretions, directly or indirectly.

**1D80.0**

**Mumps without complication**

#DRAFT# This is an inflammation of one or both parotid glands, the major salivary glands located on either side of the face, in humans. This disease is due to mumps virus, causing high morbidity and in some cases more serious complications such as deafness.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|               | <p>Within a few days of infection the mumps virus can attack the testicular glands leading to abrupt onset of fever ranging from 39 to 41 °C, severe testicular pain, scrotal swelling and erythema. Mumps induced orchitis typically presents 1-2 weeks after parotitis. The virus' infiltration into the testicular glands can cause parenchymal inflammation, separation of seminiferous tubules and perivascular interstitial lymphocyte infiltration. Testicular atrophy can result from a rise in intratesticular pressure. Complications include oligospermia, azoospermia, and asthenospermia, which can contribute to subfertility. Infertility is more common in patients with bilateral mumps orchitis and is estimated to occur in approximately 13% of all patients. Sterility is rarely induced by mumps orchitis.</p> <p><b>Inclusions:</b> Mumps orchitis</p> |
| <b>1D80.2</b> | <b>Meningitis due to mumps virus</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|               | <p>A disease of the meninges, caused by an infection with mumps virus. This disease is characterised by photophobia, vomiting, fever, arthralgia, headache, stiff neck, convulsions, or seizures. This disease may also present with pale, blotchy skin or a distinctive rash. Transmission is by haematogenous spread to the meninges after inhalation of infected respiratory secretions or droplet transmission. Confirmation is by identification of mumps virus in a buccal swab or blood sample.</p> <p><b>Inclusions:</b> mumps meningitis</p>                                                                                                                                                                                                                                                                                                                         |

**1D84****Viral conjunctivitis**

Inflammation, often mild, of the conjunctiva caused by a variety of viral agents. Conjunctival involvement may be part of a systemic infection.

**Coding Note:** Code also the causing condition

**Exclusions:** ocular disease herpesviral [herpes simplex] (1F00.1)

Ophthalmic zoster (1E91.1)

**Coded Elsewhere:** Zoster conjunctivitis (1E91.1)

**1D84.0****Conjunctivitis due to adenovirus**

A condition of the conjunctiva, caused by an infection with adenovirus. This condition is characterised by itchy eyes, tearing, redness, discharge, or photophobia (with corneal involvement). Transmission is by direct contact, indirect contact, or droplet transmission.

**Inclusions:** Acute adenoviral follicular conjunctivitis

Swimming-pool conjunctivitis

**1D84.1****Acute epidemic haemorrhagic conjunctivitis**

A disease of the conjunctiva, caused by an infection with enterovirus. This disease is characterised by painful and red eyes, swollen lids, conjunctival follicles, chemosis, or subconjunctival haemorrhage. Transmission is by direct contact, or contact with contaminated water.

**1D84.Y****Other specified viral conjunctivitis**

**Coding Note:** Code also the causing condition

**1D84.Z****Viral conjunctivitis, unspecified**

**Coding Note:** Code also the causing condition

**1D85****Viral carditis**

A disease of the heart, caused by an infection with a viral source. This disease is characterised by fatigue, dyspnoea, palpitations, malaise, or atypical chest discomfort. This disease may also present with sinus tachycardia, cardiomyopathy, idiopathic ventricular arrhythmias, or cardiovascular collapse. Transmission is by endogenous spread or iatrogenic transmission. Confirmation is identification of the viral source in advanced imaging or cardiac biopsy.

**Exclusions:** Influenzal myocarditis, other influenza virus identified (1E30)

**1D85.0****Dilated cardiomyopathy secondary to viral myocarditis****1D85.1****Acute viral carditis****1D85.2****Chronic viral carditis****1D85.3****Aseptic myocarditis of newborn****1D85.4****Coxsackie carditis****1D85.Y****Other specified viral carditis****1D85.Z****Viral carditis, unspecified**

**1D86****Viral haemorrhagic fever, not elsewhere classified**

**Exclusions:** Certain arthropod-borne viral fevers (1D40-1D4Z)  
 Certain zoonotic viral diseases (1D60-1D6Z)

Viral infection of unspecified site (1D90-1D9Z)

**Exclusions:** Cytomegaloviral disease (1D82)  
 Herpes simplex infections (1F00)

**1D90****Adenovirus infection of unspecified site**

Adenovirus infections most commonly cause illness of the respiratory system; however, depending on the infecting serotype, they may also cause various other illnesses and presentations.

**1D91****Enterovirus infection of unspecified site**

**Coded Elsewhere:** Congenital echovirus infection (KA62.4)  
 Congenital enterovirus infection (KA62.5)

**1D92****Coronavirus infection, unspecified site**

**Exclusions:** Severe acute respiratory syndrome (1D65)  
 COVID-19, virus not identified (RA01.1)  
 COVID-19, virus identified (RA01.0)

**1D93****Parvovirus infection of unspecified site**

**Coded Elsewhere:** Congenital parvovirus syndrome (KA62.7)

**1D9Y****Other viral infections of unspecified site****1D9Z****Unspecified viral infection of unspecified site****1E1Y****Other specified viral diseases****1E1Z****Unspecified viral disease****Influenza (1E30-1E32)**

Any disease of the respiratory system, caused by an infection with influenza virus. These diseases are characterised by fever, cough, headache, myalgia, arthralgia, or malaise. Transmission is by inhalation of infected respiratory secretions. Confirmation is by identification of influenza virus from a nasopharyngeal, nose, or throat swab.

**1E30****Influenza due to identified seasonal influenza virus**

**Exclusions:** Haemophilus influenzae [H. influenzae] meningitis (1D01.00)  
 Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

**1E31****Influenza due to identified zoonotic or pandemic influenza virus**

Influenza, caused by influenza virus strains of special epidemiological importance with an animal-human or inter-human transmission.

For use of this category, reference must be made to the guidelines of the Global Influenza Programme (GIP, [www.who.int/influenza/](http://www.who.int/influenza/)) of WHO.

**Coding Note:** Influenza caused by influenza virus strains of special epidemiological importance with an animal-human or inter-human transmission limited to the inclusions

**Exclusions:** Haemophilus influenzae [H. influenzae] meningitis (1D01.00)  
Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

**1E32****Influenza, virus not identified**

Any disease of the respiratory system, caused by an unidentified strain of influenza virus. These diseases are characterised by fever, cough, headache, myalgia, arthralgia, or malaise. Transmission is by inhalation of infected respiratory secretions.

**Inclusions:** Influenza specific virus not stated to have been identified  
Viral influenza specific virus not stated to have been identified

**Exclusions:** Haemophilus influenzae [H. influenzae] meningitis (1D01.00)  
Haemophilus influenzae [H. influenzae] pneumonia (CA40.02)

## Viral hepatitis (1E50-1E5Z)

A group of liver diseases caused by infection with one or more of the five hepatitis viruses, hepatitis A virus, hepatitis B virus, hepatitis C virus, hepatitis D virus and hepatitis E viruses. The infection may be recent and present for less than 6 months (acute hepatitis) or present for more than 6 months (chronic hepatitis), in which case progression to cirrhosis and liver cancer can occur. Transmission is by the faecal-oral route including water contamination, sexual transmission, blood and body fluid contamination (parenteral spread) and from mother to baby at the time of birth (vertical transmission). Depending on the virus, diagnosis is confirmed by detection of specific viral antigens, anti-viral antibodies or viral nucleic acids in serum.

**Exclusions:** Herpes simplex hepatitis (1F00)  
Autoimmune hepatitis (DB96.0)  
Non-alcoholic steatohepatitis (DB92.1)

**Coded Elsewhere:** Viral hepatitis complicating pregnancy, childbirth or the puerperium (JB63.4)  
Congenital viral hepatitis (KA62.9)

### 1E50

#### Acute viral hepatitis

A group of liver diseases characterised by liver inflammation and fibrosis, caused by more than 6 months of infection with one or more of hepatitis B virus, hepatitis C virus and hepatitis D virus, with or without HIV. Even at stage of cirrhosis there are often no symptoms. Otherwise, clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Transmission of hepatitis B and C viruses is by blood and body fluid contamination, sexual transmission, and from mother to baby at the time of birth (vertical transmission). In addition to detection of specific antigens (HBsAg) and antibodies (anti-HCV), diagnostic assessment requires assay of viral nucleic acids (HBV DNA, HCV RNA etc).

**Exclusions:** Infectious liver disease (DB90)  
Acute or subacute hepatic failure (DB91)  
Chronic viral hepatitis (1E51)

**Coded Elsewhere:** Cytomegaloviral hepatitis (1D82.0)  
Epstein-Barr viral hepatitis (DB90.Y)

### 1E50.0

#### Acute hepatitis A

Acute liver injury and inflammation caused by recent and short-term (less than 6 months) infection with hepatitis A virus (HAV). Transmission is by the faecal-oral route. Diagnosis is confirmed by presence of IgM-anti-HAV in serum. Clinical features, if they occur, are characterised by anorexia, nausea and fever, with jaundice in severer cases.

**Exclusions:** Infectious liver disease (DB90)  
Acute or subacute hepatic failure (DB91)

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Confirmation is by detection of anti-hepatitis E virus IgM antibodies in an individual's serum.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>1E50.Y</b> | <b>Other specified acute viral hepatitis</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>1E50.Z</b> | <b>Acute viral hepatitis, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**1E51****Chronic viral hepatitis**

A disease of the liver, caused by a chronic infection with a hepatotropic virus such as hepatitis B, C, D virus, with or without HIV (for six months or longer). This disease is characterised by fatigue, joint and muscle pain, jaundice, or urine of dark yellow colour. Transmission is by sexual contact, or direct contact with contaminated blood or body fluids. Confirmation is by detection of anti-hepatitis antibodies in the individual's serum.

**Exclusions:**           Alcoholic liver disease (DB94)  
                              Autoimmune hepatitis (DB96.0)  
                              Non-alcoholic fatty liver disease (DB92)

**1E51.0****Chronic hepatitis B**

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis B virus. Even at stage of cirrhosis there are often no symptoms. Otherwise, clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Transmission is by blood and body fluid contamination, sexual transmission, and from mother to baby at the time of birth (vertical transmission). Confirmation of the diagnosis is by detection of HBsAg, but assessment of severity, prognosis and indication for treatment requires quantification of HBV DNA in serum.

**Coded Elsewhere:** Chronic hepatitis B, co-infected with hepatitis D virus (1E51.2)  
                              Hepatitis B surface antigen [HBsAg] carrier (1E51.Y)

**1E51.00****Chronic hepatitis B with human immunodeficiency virus co-infection**

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis B virus and with the human immunodeficiency virus (HIV). Clinical features include fatigue, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension), and outcomes, including hepatocellular carcinoma are worse than for hepatitis B without HIV infection.

**1E51.0Y****Other specified chronic hepatitis B****1E51.0Z****Chronic hepatitis B, unspecified**

**1E51.1****Chronic hepatitis C**

A liver disease characterised by liver inflammation and fibrosis caused by more than 6 months of infection with the hepatitis C virus. Even at stage of cirrhosis there may be no symptoms. Otherwise, clinical features include fatigue and impaired quality of life, hard liver edge and complications of cirrhosis (muscle wasting, ascites, splenomegaly/portal hypertension). Chronic hepatitis C increases the risks of type 2 diabetes mellitus and cardiovascular disease, which contribute to increased all-cause mortality. Transmission is by blood and body fluid contamination, rarely by sexual transmission and from mother to baby at the time of birth (vertical transmission). Confirmation of the diagnosis is by detection of HCV RNA in the presence of a positive anti-HCV in serum.

**Exclusions:** Non-alcoholic fatty liver disease (DB92)

**Coded Elsewhere:** Chronic hepatitis B, co-infected with hepatitis C virus (1E51.0Y)

Chronic hepatitis B, co-infected with hepatitis C virus and hepatitis D virus (1E51.0Y)

**1E51.2****Chronic hepatitis D**

**Coded Elsewhere:** Chronic hepatitis B, co-infected with hepatitis C virus and hepatitis D virus (1E51.0Y)

**1E51.3****Chronic hepatitis E****1E51.Y****Other specified chronic viral hepatitis****1E51.Z****Chronic viral hepatitis, unspecified****1E5Z****Viral hepatitis, unspecified**

## Viral infections characterised by skin or mucous membrane lesions (1E70-1F0Z)

### Infections due to poxvirus (1E70-1E7Z)

**1E70****Smallpox**

A disease caused by an infection with variola virus. This disease is characterised by a maculopapular rash that progresses to vesicles (commonly on the face, arms, and legs), and fever. Transmission is by direct contact. Confirmation is by identification of the variola virus in a skin sample of the rash.

In 1980 the 33rd World Health Assembly declared that smallpox had been eradicated. The classification is maintained for surveillance purposes.

**Inclusions:** Variola

**1E71****Mpox**

A disease caused by an infection with monkeypox virus. In the first phase, this disease is characterised by lymphadenopathy, fever, headache, or malaise; in the second phase, this disease is characterised by a rash that starts as maculopapules and progresses to vesicles, then pustules, followed by crusts (may occur on the face, palms of the hands, soles of the feet, body, and mucous membranes). Transmission is by direct contact with infected animals (including body fluids or lesions), direct contact with body fluid from infected individuals, or through fomites. Confirmation is by identification of monkeypox virus.

**Inclusions:** monkeypox

**1E72****Cowpox**

Cowpox is due to infection by an orthopoxvirus. Human disease is caused by cutaneous inoculation from an infected host. Cowpox is endemic in Europe amongst small rodents, particularly wood mice and wood voles. After a seven day incubation it causes a systemic febrile flu-like illness. Lesions are solitary or few, mainly affecting the face and

hands. An initial erythematous papula or blister later forms a crusted eschar which heals slowly leaving a deep pock-like scar.

**1E73****Vaccinia**

A poxvirus which was formerly used to protect against smallpox. Its use as a vaccine can be complicated by a generalised rash secondary to viraemia, accidental infection of other sites or other individuals, progressive infection at the site of vaccination or, rarely, encephalomyelitis and myopericarditis.

**1E74****Buffalopox**

Buffalopox is caused by an orthopox virus related to vaccinia virus. It is acquired in humans by direct inoculation from infected water buffalo. It is generally a mild illness similar to cowpox with just a few lesions on the hands and arms. It leaves minor pock-like scars.

**1E75****Orf**

Orf is a virus infection of the skin contracted from sheep and goats. Orf is caused by a parapox virus which infects mainly young lambs and goats. Human lesions are caused by direct inoculation of infected material. Orf is not uncommon among sheep farmers, shearers, freezing workers, vets and farmers' wives or their children who bottle-feed lambs. They occur most commonly on the fingers, hands or forearms but can appear on the face.

**1E76****Molluscum contagiosum**

A disease of the skin and mucous membranes, caused by an infection with molluscum contagiosum virus. This disease is characterised by papular skin eruptions, commonly 2-3 millimetres in diameter. Transmission is by direct contact.

**Exclusions:** Viral warts (1E80)

**1E7Y****Other specified infections due to poxvirus****1E7Z****Infections due to poxvirus, unspecified**

Human papillomavirus infection of skin or mucous membrane (1E80-1E8Z)

Infection of the skin and mucous membranes by the human papillomavirus (HPV), the agent responsible for viral warts in humans. Clinical manifestations depend on the virus subtype and the anatomical site involved.

**Coded Elsewhere:** Anogenital warts (1A95)

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1E80</b>   | <b>Common warts</b><br>Common warts are due to an infection of the epidermis by certain human papilloma viruses, most commonly HPV subtypes 1, 2, 4, 27 and 57. They manifest typically as papillomatous, keratinous growths on the hands and feet but may affect any part of the skin (and also adjacent mucous epithelia). They are very common during childhood and adolescence.<br><b>Exclusions:</b> Warts of lips or oral cavity (1E82) |
| <b>1E80.0</b> | <b>Digital or periungual warts</b><br>Viral warts affecting the fingers, thumbs or non-plantar (or non-weight-bearing) skin of the toes. | <b>1E81</b>   | <b>Plane warts</b><br>Plane warts (flat warts) are clinically distinct from common warts and manifest as multiple small flat-topped, often lightly pigmented papules on the face or extremities. They are caused by human papillomavirus (HPV) subtypes 3 and 10.                                                                                                                                                                             |
| <b>1E82</b>   | <b>Warts of lips or oral cavity</b><br>Infection of the lips and/or oral cavity, particularly the keratinized surfaces of the gingiva and palate, with "skin" type human papillomavirus (types 2 and 4). Focal epithelial hyperplasia (Heck disease) is a specific form of oral human papillomavirus infection caused by types 13 or 32 and of high prevalence in certain communities in the Americas.                                        |
| <b>1E82.0</b> | <b>Focal epithelial hyperplasia of oral mucous membranes</b><br>Otherwise known as Heck disease, this is due to infection of the oral mucosa by human papillomavirus types 13 or 32. It most commonly presents as multiple smooth mucosal papules, giving rise to a cobblestone appearance. It is particularly common in children from native communities of the Americas with incidence rates of up to 30% reported.                         |

**1E83****Wart virus proliferation in immune-deficient states**

Enhanced proliferation of human papillomavirus as a result of a failure of immune surveillance. This may be due to a genetic defect, disease or iatrogenic immunosuppression.

**1E8Z****Viral warts, not elsewhere classified**

Varicella zoster virus infections (1E90-1E91.Z)

**1E90****Varicella**

A disease caused by an infection with varicella zoster virus. This disease is characterised by a vesicular rash and fever. Transmission is by inhalation of infected respiratory secretions, or direct contact with fluid from vesicles.

**Coded Elsewhere:** Fetal varicella syndrome (KA62.2)

Congenital varicella (KA62.2)

**1E90.0****Varicella without complication**

A disease caused by an infection with varicella zoster virus. This disease is characterised by a vesicular rash and fever. Transmission is by inhalation of infected respiratory secretions, or direct contact with fluid from vesicles.

**1E90.1****Varicella meningitis**

A disease of the meninges, caused by an infection with varicella zoster virus. This infection is characterised by fever, stiff neck, headache, vomiting, photophobia, and sometimes an altered mental status or body aches. Transmission is through hematogenous spread to the meninges after inhalation of infected respiratory secretions, or direct contact with fluid from vesicles. Confirmation is by identification of varicella zoster viral DNA or anti-varicella zoster IgG in cerebrospinal fluid.

**1E90.2****Varicella encephalitis**

#DRAFT# This is a highly contagious but non-threatening disease caused by primary infection with varicella zoster virus (VZV). This diagnosis is with an acute inflammation of the brain.

**Inclusions:** Postchickenpox encephalitis

Varicella encephalomyelitis

**1E90.Y****Varicella with other specified complication****1E90.Z****Varicella, unspecified****1E91****Zoster**

A disease caused by the reactivation of a latent infection with varicella zoster virus. This disease commonly presents with a rash (typically within one or two adjacent dermatomes), cutaneous hyperaesthesia, or fever.

**1E91.0****Zoster without complications**

A painful blistering skin eruption following a dermatomal distribution resulting from reactivation of Varicella zoster virus in dorsal nerve root ganglia.

| <b>1F00.21</b> | <p>Encephalitis due to herpes simplex virus</p> <p>Herpetic encephalitis is a cerebral infection caused by herpes simplex virus type 1 (HSV1). It presents as acute necrotising temporal encephalitis. Onset is rapid (less than 48 hours) with a fever of 40 °C, headaches, and behavioural, language and memory problems. These initial manifestations are followed by numbness and coma, which may be accompanied by convulsions and paralysis. This disease, which affects only a small minority of HSV1-infected individuals, results from a primary immune deficiency.</p> <p><b>Inclusions:</b> Simian B disease</p> |

| 1F02.2 | <b>Rubella without complication</b> <p>Rubella was a common childhood viral infection until the advent of mass immunization programmes. It is characterised by a short-lived maculopapular exanthem, lymphadenopathy and mild fever: the majority of infections are not associated with significant morbidity. Transmission is by inhalation of infected respiratory secretions or by direct contact. Confirmation is by identification of rubella virus in nasal swab, throat swab or blood samples, or by detection of rubella virus specific IgM antibodies. Its public health importance lies in its potential to cause devastating harm to the fetus of an infected mother (congenital rubella syndrome).</p> |
| 1F02.Y | <b>Rubella with other specified complication</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1F03   | <b>Measles</b> <p>A disease of the respiratory system, caused by an infection with Morbillivirus. This disease is characterised by a blotchy rash, fever, cough, conjunctivitis, or malaise. This disease may also present with tiny white spots with bluish-white centres inside the mouth. Transmission is by inhalation of infected respiratory secretions, airborne transmission or direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.</p> <p><b>Inclusions:</b> morbilli</p> <p><b>Coded Elsewhere:</b> Subacute sclerosing panencephalitis (8A45.01)</p>                                                                                                  |
| 1F03.0 | <b>Measles without complication</b> <p>A disease caused by an infection with Morbillivirus. This disease is characterised by fever, cough, coryza, conjunctivitis, enanthema, or maculopapular rash, without any additional secondary pathological conditions. Transmission is by inhalation of infected respiratory secretions, or direct contact. Confirmation is by detection of Morbillivirus RNA, or detection measles-specific IgM antibodies.</p>                                                                                                                                                                                                                                                           |
| 1F03.1 | <b>Measles complicated by encephalitis</b> <p>A disease caused by an infection with Morbillivirus that is complicated by an infection of the brain. This disease is characterised by symptoms of measles as well as inflammation of the brain. This disease may also present with fever, headache, poor appetite, vomiting, confusion, lethargy, or photophobia. Transmission is by haematogenous spread to the brain after inhalation of infected respiratory secretions, by airborne transmission, or by direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.</p>                                                                                               |
| 1F03.2 | <b>Measles complicated by meningitis</b> <p>A disease caused by an infection with Morbillivirus that is complicated by an infection of the meninges. This disease is characterised by symptoms of measles as well as inflammation of the meninges. This disease may also present with a fever, vomiting, lethargy, confusion, muscle pain, photophobia, or convulsions. Transmission is by haematogenous spread to the meninges after inhalation of infected respiratory secretions, airborne transmission, or direct contact. Confirmation is by detection of Morbillivirus RNA or measles-specific IgM antibodies.</p> <p><b>Inclusions:</b> Postmeasles meningitis</p>                                          |
| 1F03.Y | <b>Measles with other complications</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Mycoses (1F20-1F2Z)

**Exclusions:** Mycosis fungoides (2B01)  
Hypersensitivity pneumonitis due to organic dust (CA70)

**Coded Elsewhere:** Intestinal fungal infections  
Fungal infection of fetus or newborn (KA63)

### 1F20

#### Aspergillosis

Aspergillosis is a disease caused by fungi of the genus *Aspergillus*. The organism is ubiquitous, being found in soil and water or in decaying vegetation. While *Aspergillus* is entirely harmless for most individuals, the spores can cause various forms of mycosis in people with lung diseases or weakened immune system.

**Inclusions:** aspergilloma

**Coded Elsewhere:** Aspergillus-induced allergic or hypersensitivity conditions (CA82.4)  
Neonatal aspergillosis (KA63.1)

#### 1F20.0 Invasive aspergillosis

A disease caused by an infection with the fungi *Aspergillus*. This disease is characterised by colonization and invasion of tissue by *Aspergillus* in one part of the body and may spread to other parts of the body. Transmission is commonly by inhalation of *Aspergillus* spores.

1F20.00 Invasive aspergillosis of the digestive tract

1F20.01 Invasive cerebral aspergillosis

1F20.02 Disseminated aspergillosis  
Invasive aspergillosis affecting three or more organs.

1F20.0Y Invasive aspergillosis of other specified site

1F20.0Z Invasive aspergillosis, unspecified

#### 1F20.1 Non-invasive aspergillosis

1F20.10 *Aspergillus* otomycosis  
Chronic superficial fungal infection of the external auditory canal and auricle due to saprophytic fungi of the genus *Aspergillus*.

1F20.11 Chronic aspergillosis of the paranasal sinuses  
**Inclusions:** Chronic granulomatous *Aspergillus* rhinosinusitis

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>1F20.12</b> | <p>Chronic pulmonary aspergillosis</p> <p>Chronic pulmonary aspergillosis (CPA) presents as nodular or cavitory lesion(s) in the lungs, of at least three months duration. It is caused by <i>Aspergillus</i> species as demonstrated on histological staining, by positive culture of biopsy, or positive <i>Aspergillus</i> IgG antibodies.</p> <p>The most common form of CPA is chronic cavitory pulmonary aspergillosis (CCPA). Untreated it may progress to chronic fibrosing pulmonary aspergillosis (CFPA). Less common manifestations of CPA include <i>Aspergillus</i> nodule and single aspergilloma. All these entities are found in non-immunocompromised patients with prior or current lung disease. Subacute invasive pulmonary aspergillosis (formerly called chronic necrotising pulmonary aspergillosis) is a more rapidly progressive infection (&lt;3 months) usually found in moderately immunocompromised patients.</p> |

This disease is characterised by fever, chills, cough, nausea, vomiting, tachypnoea, tachycardia, or dyspnoea. Transmission is by opportunistic transmission. Confirmation is by identification of <i>Candida</i> from a sputum sample.                                                                                                                                                                                                                                                                                                                                                                        |

| <b>1F24</b>    | <b>Chromoblastomycosis</b><br>Chromoblastomycosis is a chronic fungal infection of the skin and subcutaneous tissues caused by a variety of pigmented fungi including <i>Phialophora verrucosa</i> , <i>Fonsecaea pedrosoi</i> , <i>Fonsecaea compacta</i> and <i>Cladophialophora carrionii</i> , which can be found in soil and wood. The infection usually follows trauma, such as a puncture from a splinter of wood and tends to affect exposed sites such as the feet and ankles. Chromoblastomycosis manifests initially as a warty papule which slowly enlarges to form a hypertrophic, warty plaque. Eventually, after months or many years, large hyperkeratotic masses may form, sometimes with secondary ulceration. |
| <b>1F25</b>    | <b>Coccidioidomycosis</b><br>A disease caused by an infection with the fungi <i>Coccidioides</i> . This disease presents with symptoms depending on the site of infection, or may be asymptomatic. Transmission is commonly by inhalation of fungal spores. Confirmation is by identification or culture of <i>Coccidioides</i> from affected tissue or samples, or detection of antibodies against coccidioides in serum or cerebrospinal fluid.                                                                                                                                                                                                                                                                                |
| <b>1F25.0</b>  | <b>Pulmonary coccidioidomycosis</b><br>A disease of the pulmonary system, caused by an infection with the fungi <i>Coccidioides</i> . This disease is characterised by cough, myalgia, fatigue, chest pain, pneumonia, or pleural effusion. Transmission is commonly by inhalation of fungal spores. Confirmation is by direct examination or culture of <i>Coccidioides</i> in a sputum, bronchoalveolar lavage fluid, or tissue sample.                                                                                                                                                                                                                                                                                        |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1F25.00</b> | <p>Acute pulmonary coccidioidomycosis</p> <p>Forty per cent of coccidioidal infections result in symptomatic pulmonary disease that may be indistinguishable from a bacterial community-acquired pneumonia. Radiographically these are usually focal alveolar infiltrates. Infection may be associated with the development of a rash, particularly erythema nodosum and erythema multiforme. Occasionally, there may be symmetric arthralgias or arthritis. Peripheral blood eosinophilia is not uncommon. Acute primary pulmonary coccidioidomycosis, particularly when associated with erythema nodosum and/or erythema multiforme, is frequently called "Valley fever." When associated with arthralgias or arthritis, it has been termed "desert rheumatism."</p> |
| <b>1F25.01</b> | <p>Chronic pulmonary coccidioidomycosis</p> <p>A chronic form of pulmonary coccidioidomycosis. Pulmonary sequelae occur in approximately 5% of all cases of acute pulmonary coccidioidomycosis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>1F25.1</b>  | <p><b>Extrathoracic coccidioidomycosis</b></p> <p>Coccidioidomycosis involving sites other than the lungs and thoracic cavity. Recognised sites include lymph nodes, bones, joints, central nervous system and skin. Transmission is through haematogenous spread to other body sites after inhalation of fungal spores or by direct inoculation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>1F25.10</b> | <p>Disseminated coccidioidomycosis</p> <p>Diffuse pulmonary coccidioidomycosis occurs either when there is inhalation of a massive number of arthroconia, such as may occur during archeological excavations, or among individuals with severely depressed cellular immunity (e.g., late HIV-1 infection [AIDS]; cancer chemotherapy; allogeneic transplant recipients, treatment with corticosteroids; and during the second, third trimesters and postpartum pregnancy). The radiographic appearance often is a mixture of small nodules and interstitial findings, sometimes called "reticulonodular" or, because it may resemble overwhelming pulmonary tuberculosis, "miliary."</p>                                                                               |
| <b>1F25.11</b> | <p>Primary cutaneous coccidioidomycosis</p> <p>Coccidioidomycosis may rarely result from direct inoculation, usually through a puncture of the skin by a thorn or other vegetative structure. The infection generally remains confined to this area with local lymphangitic spread and is not considered indicative of disseminated disease. Coccidioidal serology tests may be positive.</p>                                                                                                                                                                                                                                                                                                                                                                          |
| <b>1F25.12</b> | <p>Coccidioides meningitis</p> <p>An uncommon but often lethal form of coccidioidomycosis due to dissemination of Coccidioides fungi from the primary site of infection, principally the lungs, to the central nervous system.</p> <p><b>Inclusions:</b> Coccidioidomycosis meningitis</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**1F26**

### **Conidiobolomycosis**

Conidiobolomycosis is a subcutaneous infection involving nasal mucosa and paranasal sinuses, leading to formation of firm, subcutaneous nodules or polyps. The infection may be acquired via inhalation of spores or a minor trauma such as an insect bite. The infected host is frequently an otherwise healthy individual working outdoors in tropical areas. Conidiobolomycosis can, however, cause major facial disfigurement. In individuals with impaired immune responses more invasive and potentially fatal infections may occur: such infections are not usually associated with skin lesions.

**Inclusions:** Rhinomentomophthoromycosis

**1F27**

### **Cryptococcosis**

A disease caused by an infection with the fungi *Cryptococcus neoformans* or *Cryptococcus gattii*. This disease commonly presents with shortness of breath, cough, fever, fatigue, or headache. Transmission is by inhalation of fungal spores. Confirmation is by identification of *Cryptococcus neoformans* or *Cryptococcus gattii* in a blood, sputum, or cerebrospinal fluid sample.

**1F27.0**

#### **Pulmonary cryptococcosis**

The pattern of cryptococcal pulmonary disease ranges from asymptomatic airway colonization to pneumonia to acute respiratory distress syndrome. If present, symptoms include cough, dyspnoea or chest pain. Common chest X-ray appearances include nodules or infiltrates. In the immunocompetent host, focal lesions are more commonly seen with infection due to *C. gattii*.

**1F27.1**

#### **Cerebral cryptococcosis**

A disease of the central nervous system, caused by an infection with the fungi *Cryptococcus neoformans* or *Cryptococcus gattii*. This disease is characterised by fever, headache, lethargy, or neurological deficits. Transmission is by inhalation of fungal spores. Confirmation is by identification of *Cryptococcus neoformans* or *Cryptococcus gattii* in a blood, sputum, or cerebrospinal fluid sample.

**1F27.10**

#### **Meningitis due to *Cryptococcus neoformans***

Inflammation of the pia and arachnoid and spinal fluid associated with the fungus *cryptococcus neoformans*. The respiratory tract is the usual portal of entry and meningitis may occur after dissemination to the meninges from the lungs. *C. neoformans* meningitis tends to occur in patients with defective cellular immunity. The meningitis usually evolves subacutely, but may be acute. Clinical features include headache, fever, nausea and vomiting, meningismus, visual disturbances, abnormal mental status, seizures, and raised intracranial pressure. Headache, fever, and stiff neck may be absent. The diagnosis is made by microscopic examination of the spinal fluid, culture of CSF and blood, and the latex agglutination test to detect the capsular polysaccharide antigen in CSF and blood. The organism may be seen on Gram stain or India ink stain of the CSF. The spinal fluid usually shows variable lymphocytic pleocytosis, a low glucose content, and a high protein level.

|               | Dermatophytosis (tinea, ringworm) is a superficial infection of the skin, hair or nails by dermatophyte fungi of the genera <i>Trichophyton</i> , <i>Epidermophyton</i> or <i>Microsporum</i> . These fungi normally invade only the outer keratinous layer of the epidermis (stratum corneum), the hair shaft and the nail. They count amongst the commonest infections in man. Some species (e.g. <i>Trichophyton rubrum</i> ) are essentially anthropophilic and infect only man whereas others are zoophilic (e.g. <i>Trichophyton verrucosum</i> ) but may cause human infection from contact with infected animals. |

**1F29****Eumycetoma**

A localised chronic infection caused by various species of fungi and characterised by the formation of aggregates of the causative organisms (grains) within abscesses. This results in severe damage to skin, subcutaneous tissues and bones of the feet, hands and other parts of the body, with draining sinuses which discharge grains to the surface. Recognised agents include *Madurella mycetomatis*, *Madurella grisea*, *Leptosphaeria senegalensis*, *Curvularia lunata*, *Scedosporium apiospermum*, *Neotestudina rosatii*,

*Acremonium* spp. and *Fusarium* spp.

**Inclusions:** Mycetoma due to fungal infection

**Exclusions:** Actinomycetoma (1C43)

**1F2A****Histoplasmosis**

Histoplasmosis is a disease caused by the fungus *Histoplasma* that exists worldwide with two significant variants: *Histoplasma capsulatum* and *Histoplasma duboisii*.

**Coded Elsewhere:** Histoplasmosis-related fibrosing mediastinitis (CB22.0)

**1F2A.0****Pulmonary histoplasmosis capsulati**

A disease of the pulmonary system, caused by an infection with the fungus *Histoplasma capsulatum*. This disease is characterised by fever, chest pains, or a dry, nonproductive cough. Transmission is by inhalation of fungal spores, commonly from contaminated soil, or bat or bird faeces. Confirmation is by identification of *Histoplasma capsulatum* from affected tissue or body fluids, detection of antibodies against *Histoplasma capsulatum*, or detection of *Histoplasma capsulatum* antigen.

**1F2A.1****Histoplasmosis due to *Histoplasma duboisii***

This form of histoplasmosis is endemic to Sub-Saharan Africa and is generally less virulent than histoplasmosis due to *H. capsulatum*, the classical form which occurs predominantly in tropical and subtropical regions of the Americas but is also seen in Africa and Asia. Otherwise known as African histoplasmosis, histoplasmosis due to *Histoplasma duboisii* usually involves the skin and subcutaneous tissue, lymph nodes and bones and rarely the lungs and other internal organs.

**1F2A.Y****Other specified histoplasmosis****1F2A.Z****Histoplasmosis, unspecified****1F2B****Lobomycosis**

A disease of the skin, caused by an infection with the fungus *Lacazia loboi*. This disease commonly presents with dermal nodules (either lenticular or in plaques), keloids, subcutaneous mycoses, or malignant tumours. Transmission is commonly by direct contact with contaminated water, soil, vegetation, or may be by direct contact with an infected dolphin. Confirmation is by identification of *Lacazia loboi* in a lesion exudate or tissue sample.

**Inclusions:** Lobo disease

**1F2C****Mucormycosis**

A disease caused by an infection with the fungi from the order Mucorales. This disease presents with symptoms depending on the site of the infection. Transmission is by direct contact with infected soil or decaying matter. Confirmation is by identification of fungi from the order Mucorales from a tissue sample.

**1F2D****Non-dermatophyte superficial dermatomycoses**

Any condition of the skin and mucous membranes, caused by an infection with fungi other than *Candida* and dermatophytes.

**Exclusions:** Candidosis (1F23)  
Dermatophytosis (1F28)

**1F2D.0****Pityriasis versicolor**

A disease of the skin, caused by an infection with the fungi *Malassezia*. This disease is characterised by white, pink, fawn, brown, or often coalescing lesions that may be covered with thin furfuraceous scales. This disease commonly presents on the trunk, shoulders and arms, or neck and face. Transmission is by opportunistic transmission. Confirmation is by identification of *Malassezia* in a skin sample.

**1F2D.1*****Malassezia* folliculitis**

*Malassezia* folliculitis is caused by the invasion of the hair follicle by *Malassezia* yeasts. Although *Malassezia* yeasts are a part of the normal human microflora, under certain conditions they can cause superficial dermatological conditions. The invasion results in the development of erythematous papules, and sometimes pustules, which may be either asymptomatic or itchy. Usually *Malassezia* yeasts are present along with staphylococci and propionibacteria in the follicles.

**Inclusions:** Seborrhoeic folliculitis

**Exclusions:** Seborrhoea (ED91.2)

**1F2D.2****White piedra**

A disease of the hair shaft, caused by an infection with the fungi *Trichosporon beigelii*. This disease is characterised by irregular, soft, white, or light brown nodules which adhere to the hair follicle. Transmission is by direct contact with contaminated soil or water, or by airborne transmission. Confirmation is by identification of *Trichosporon beigelii* in a hair follicle sample.

**Inclusions:** Trichosporosis nodosa

**1F2D.3****Black piedra**

**Inclusions:** Trichomycosis nodularis

| <b>1F2E</b>   | <p><b>Paracoccidioidomycosis</b></p> <p>A disease caused by an infection with the fungi <i>Paracoccidioides brasiliensis</i>. This disease commonly presents with fever, toxæmia, weight loss, adenopathy, hepatosplenomegaly, anaemia, or eosinophilia. This disease may present with symptoms similar to tuberculosis, leukaemia, or lymphoma. Transmission is by inhalation of fungal spores. Confirmation is by identification of <i>Paracoccidioides brasiliensis</i> in a blood, sputum, or skin sample.</p>                                                                                                                                                                                                                 |
| <b>1F2E.0</b> | <p><b>Pulmonary paracoccidioidomycosis</b></p> <p>A disease of the pulmonary system, caused by an infection with the fungi <i>Paracoccidioides brasiliensis</i>. This disease is characterised by fever, cough, dyspnoea, or malaise. Transmission is by inhalation of fungal spores. Confirmation is by identification of <i>Paracoccidioides brasiliensis</i> in a blood or sputum sample.</p>                                                                                                                                                                                                                                                                                                                                   |
| <b>1F2E.1</b> | <p><b>Disseminated paracoccidioidomycosis</b></p> <p>Disseminated paracoccidioidomycosis results from haematogenous and lymphatic dissemination of yeasts from the lungs and aerodigestive tract. Cutaneous involvement, seen in 25% of cases, presents as crusted papules, ulcers, nodules, and verrucous plaques. Lymphadenopathy occurs commonly in the cervical region, but all lymph node chains can be involved. Adrenal glands are commonly affected with a significant risk of adrenal insufficiency and Addisonian crisis. Long bones such as ribs, humeri, and clavicles can be involved. Mesenteric lymph node involvement can lead to bowel obstruction. Meningoencephalitis occurs in up to one quarter of cases.</p> |

| <b>1F2H</b>   | <b>Scedosporiosis</b><br>An opportunistic infection caused by fungal species of the genus <i>Scedosporium</i> . The most common clinical presentation is disseminated infection, which is associated with underlying disease, especially haematological malignancy, or with organ transplantation, especially of the lung. Infections of lung, bones or joints are also well recognised.                     |
| <b>1F2J</b>   | <b>Sporotrichosis</b><br>A disease caused by an infection with the fungi <i>Sporothrix schenckii</i> . This disease presents with symptoms depending on the site of infection. Transmission is by direct contact with infected thorny plants, sphagnum moss, soil, bales of hays, or infected plant material. Confirmation is by identification of <i>Sporothrix schenckii</i> from a tissue or skin sample. |
| <b>1F2J.0</b> | <b>Lymphocutaneous sporotrichosis</b><br>This is the most common type of sporotrichosis and follows implantation of <i>Sporothrix schenckii</i> spores into a cutaneous wound, most commonly on the upper extremity. In addition to a localised nodule or pustule, a chain of nodules develops along draining lymphatics. In longstanding cases regional lymph nodes may become involved.                    |
| <b>1F2J.1</b> | <b>Fixed cutaneous sporotrichosis</b><br>Cutaneous sporotrichosis which remains localised to the area of inoculation.                                                                                                                                                                                                                                                                                        |
| <b>1F2J.2</b> | <b>Pulmonary sporotrichosis</b><br>Pulmonary forms of infection, although uncommon, can occur when <i>Sporothrix schenckii</i> conidia are inhaled.<br>Symptoms of pulmonary sporotrichosis mimic those of tuberculosis including constitutional complaints of fever, night sweats, weight loss, and fatigue as well as respiratory complaints including dyspnoea, cough, purulent sputum, and haemoptysis.  |
| <b>1F2J.3</b> | <b>Disseminated sporotrichosis</b><br>#DRAFT# This is a disease caused by the infection of the fungus <i>Sporothrix schenckii</i> . This fungal disease usually affects the skin, although other rare forms can affect the lungs, joints, bones, and even the brain. This diagnosis is disseminated.                                                                                                         |
| <b>1F2J.Y</b> | <b>Other specified sporotrichosis</b>                                                                                                                                                                                                                                                                                                                                                                        |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 1F2J.Z | <b>Sporotrichosis, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1F2K   | <b>Talaromycosis</b> <p>Talaromycosis is an infection due to <i>Talaromyces marneffe</i>, an ubiquitous saprophyte of soil and decomposing organic matter. This dimorphic fungus, formerly known as <i>Penicillium marneffe</i>, is endemic to Southeast Asia and the southern part of China. Once considered rare, its occurrence has increased due to AIDS. It is now the third most common opportunistic infection in HIV-positive individuals. The most common symptoms are fever, skin lesions, anaemia, generalised lymphadenopathy, and hepatomegaly.</p>                                                                                            |
| 1F2L   | <b>Emmonsiosis</b> <p>An opportunistic infection caused by a variety of <i>Emmonsia</i> and <i>Emmonsia</i>-like fungal species. It was historically seen as a rare lung pathogen but is now increasingly reported as a disseminated infection in persons immunosuppressed, particularly as the result of HIV infection.</p>                                                                                                                                                                                                                                                                                                                                |
| 1F2L.0 | <b>Disseminated adiaspiromycosis</b> <p>An increasingly reported fulminant fungal infection caused by <i>Emmonsia</i> and <i>Emmonsia</i>-like fungal species. It is seen in the context of profound immunosuppression, especially from HIV infection. This is in contrast with pulmonary adiaspiromycosis, which is also caused by <i>Emmonsia</i> species but typically affects immunocompetent individuals. Its clinical presentation is similar to those of histoplasmosis and blastomycosis. Skin and lung involvement is characteristic but the CNS and blood may also be affected.</p> <p><b>Exclusions:</b> Pulmonary adiaspiromycosis (1F2L.1)</p> |
| 1F2L.1 | <b>Pulmonary adiaspiromycosis</b> <p>Pulmonary adiaspiromycosis is an infection of the lungs due to inhalation of spores of the saprophytic soil fungus <i>Chrysosporium parvum</i> (formerly <i>Emmonsia parva</i>). The fungus affects many species of rodents but may occasionally infect humans. It is characterised by the presence of huge spherules (adiaspores) in the lungs.</p> <p><b>Inclusions:</b> Adiaspiromycosis</p>                                                                                                                                                                                                                        |

## Parasitic diseases (1F40-1G2Z)

**Coded Elsewhere:** Parasitic diseases in the fetus or newborn (KA64)

### Malaria (1F40-1F4Z)

A disease caused by an infection with a protozoan parasite from the Plasmodium genus. This disease commonly presents with fever, chills, headache, nausea and vomiting, or malaise. Transmission is through the bite of an infected mosquito. Confirmation is commonly by identification of the Plasmodium genus in a blood sample.

**Coding Note:** In cases of mixed malaria code all relevant types separately.

**Coded Elsewhere:** HIV disease clinical stage 4 associated with malaria (1C61.3)

HIV disease clinical stage 3 associated with malaria (1C61.2)

HIV disease clinical stage 2 associated with malaria (1C61.1)

HIV disease clinical stage 1 associated with malaria (1C61.0)

Human immunodeficiency virus disease associated with malaria (1C61)

Malaria complicating pregnancy, childbirth, or the puerperium (JB63.60)

Other congenital malaria (KA64.Y)

### 1F40

#### Malaria due to Plasmodium falciparum

A disease caused by an infection with the protozoan parasite Plasmodium falciparum. This disease is characterised by fever, chills, headache, myalgia, arthralgia, weakness, vomiting, or diarrhoea. This disease may also present with splenomegaly, anaemia, thrombocytopenia, hypoglycaemia, pulmonary or renal dysfunction, or neurologic changes. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium falciparum in a blood sample.

**Coding Note:** Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.

**Coded Elsewhere:** Congenital falciparum malaria (KA64.1)

#### 1F40.0

##### Plasmodium falciparum malaria with cerebral complications

A disease of the cerebrum, caused by an infection with the protozoan parasite Plasmodium falciparum. This disease commonly presents with retinal whitening, splenomegaly, anaemia, thrombocytopenia, hypoglycaemia, pulmonary dysfunction, renal dysfunction, or neurologic changes. This disease may also present with fever, chills, headache, myalgia, arthralgia, weakness, vomiting, or diarrhoea. Transmission is through the bite of an infected mosquito. Confirmation is by identification of Plasmodium falciparum in a blood sample.

#### 1F40.Y

##### Other severe and complicated Plasmodium falciparum malaria

**Coding Note:** Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.

#### 1F40.Z

##### Malaria due to Plasmodium falciparum, unspecified

**Coding Note:** Includes mixed infections of Plasmodium falciparum with any other Plasmodium species.

Nonintestinal protozoal diseases (1F50-1F5Z)

Infections with unicellular organisms of the subkingdom Protozoa.

**Exclusions:** Protozoal intestinal infections (1A30-1A3Z)

**Coded Elsewhere:** Amoebiasis (1A36)

Malaria without parasitological confirmation (1F45)

Protozoal diseases complicating pregnancy, childbirth or the puerperium (JB63.6)

**1F50**

**Acanthamoebiasis**

**1F51**

**African trypanosomiasis**

A disease caused by an infection with the protozoan parasite *Trypanosoma brucei*. This disease presents with symptoms depending on the form of the protozoan parasite (*Trypanosoma brucei rhodesiense* or *Trypanosoma brucei gambiense*). Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of *Trypanosoma brucei* in a blood or tissue sample.

**1F51.0**

**Gambiense trypanosomiasis**

A disease caused by an infection with the protozoan parasite *Trypanosoma brucei gambiense*. This disease is characterised by fever, headache, muscle and joint aches, or malaise. This disease may also present with lymphadenopathy, weight loss, or neurological deficits. Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of *Trypanosoma brucei gambiense* in a biopsy of the lymph node.

**Inclusions:** West African sleeping sickness  
Infection due to *Trypanosoma brucei gambiense*

**1F51.00**

Meningitis in Gambiense trypanosomiasis

**1F51.0Y**

Other specified gambiense trypanosomiasis

**1F51.0Z**

Gambiense trypanosomiasis, unspecified

**1F51.1**

**Rhodesiense trypanosomiasis**

A disease caused by an infection with the protozoan parasite *Trypanosoma brucei rhodesiense*. This disease is characterised by a chancre at the site of the bite. This disease may also present with fever, headache, muscle and joint aches, or lymphadenopathy. Transmission is through the bite of an infected tsetse fly. Confirmation is by identification of *Trypanosoma brucei rhodesiense* in a blood sample, lymph node fluid, or biopsy of the chancre.

**Inclusions:** East African sleeping sickness  
Infection due to *Trypanosoma brucei rhodesiense*

**1F51.10**

Meningitis in Rhodesiense trypanosomiasis

**1F51.1Y**

Other specified rhodesiense trypanosomiasis

**1F51.1Z**

Rhodesiense trypanosomiasis, unspecified

**1F51.Y**

**Other specified african trypanosomiasis**

**1F51.Z African trypanosomiasis, unspecified**

**1F52 Babesiosis**

A disease caused by the protozoan parasite *Babesia*. This disease is characterised by reproduction and lysis of erythrocytes leading to symptoms that depend on the level of parasitaemia and immune status of the infected individual. This disease may present with fever, chills, malaise, myalgia, haemolytic anaemia, shock, or may be asymptomatic. Transmission is through the bite of an infected tick (*Ixodes*), or vertical transmission. Confirmation is by identification of *Babesia* in a blood smear, or detection of antibodies against *Babesia*.

**Inclusions:** Piroplasmosis

**1F53 Chagas disease**

A disease caused by an infection with the protozoan parasite *Trypanosoma cruzi*. This disease is characterised by fever, headache, lymphadenopathy, pallor, muscle pain, dyspnoea, swelling, or abdominal or chest pain. This disease may also be asymptomatic. Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of *Trypanosoma cruzi* in a blood sample.

**Inclusions:** American trypanosomiasis  
infection due to *Trypanosoma cruzi*

**1F53.1 Acute Chagas disease without heart involvement**

A disease caused by an acute infection with the protozoan parasite *Trypanosoma cruzi*. This disease is characterised by fever, headache, lymphadenopathy, pallor, muscle pain, dyspnoea, swelling, or abdominal or chest pain. This disease presents with no cardiac involvement. Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of *Trypanosoma cruzi* in a blood sample.

**1F53.2 Chronic Chagas disease with heart involvement**

A disease caused by a chronic infection with the protozoan parasite *Trypanosoma cruzi*. This disease commonly presents with severe malaise or cardiac involvement (such as cardiomyopathy, cardiac failure, thromboembolism, bradyarrhythmias, tachyarrhythmias, apical aneurysms, or cardiac arrest). Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of *Trypanosoma cruzi* in a blood sample.

**1F53.3 Chagas disease with digestive system involvement**

A disease caused by an infection with the protozoan parasite *Trypanosoma cruzi*. This disease is characterised by severe malaise or digestive system involvement (such as megaesophagus or megacolon). Transmission is by direct contact with faeces from an infected triatomine bug, vertical transmission, iatrogenic transmission, or ingestion of contaminated food or water. Confirmation is by identification of *Trypanosoma cruzi* in a blood sample.

**1F53.4 Meningitis in Chagas disease**

**1F53.Y**                    **Other specified Chagas disease**

**1F53.Z**                    **Chagas disease, unspecified**

**1F54**

**Leishmaniasis**

Leishmaniasis is due to infection by vector-borne protozoa from the genus *Leishmania*. These protozoa exist as obligate intracellular parasites in human and mammalian hosts and are transmitted from host to host by certain species of sandfly. Depending on the *Leishmania* species involved, the resultant disease picture may range from a localised cutaneous ulcer through extensive mucocutaneous destruction to severe systemic disease.

**1F54.0**                    **Visceral leishmaniasis**

A disease caused by an infection with the protozoan parasite *Leishmania*. This disease is characterised by biphasic fever, hepatosplenomegaly, pancytopenia, wasting, darkening of the skin, or may be asymptomatic. Transmission is through the bite of an infected female phlebotomine sandfly. Confirmation is by identification of *Leishmania* from a tissue or blood sample, or detection of antibodies against *Leishmania*.

**Inclusions:**                    Kala-azar

**1F54.1**                    **Cutaneous leishmaniasis**

Cutaneous leishmaniasis results from bites by sandflies infected by protozoan parasites of the genus *Leishmania*. *Phlebotomus* is the principal vector in the Old World (Mediterranean, North Africa, Ethiopia and Asia), where *L. major*, *L. tropica*, *L. aethiopica* and *L. donovani infantum* predominate. Other sandflies are responsible for transmitting the New World species, *L. mexicana* and *L. brasiliensis*. The commonest presentation is with one or more crusted nodules or ulcers on exposed sites which gradually heal with scarring. Mexican and Ethiopian forms have a tendency to cause diffuse infiltration of the skin; South American forms frequently progress to mucocutaneous leishmaniasis.

**Coded Elsewhere:** Post-kala-azar dermal leishmaniasis (1F54.0)

**1F54.2**                    **Mucocutaneous leishmaniasis**

Mucocutaneous leishmaniasis is a secondary infection of nasal and oral mucosae, predominantly by *Leishmania braziliensis*. It usually first manifests within two years of initial cutaneous infection but often after the latter has healed. It results from lymphatic or haematogenous spread of infection and can cause severe local tissue destruction.

**Inclusions:**                    *Leishmania braziliensis* infection

**1F54.Z**                    **Leishmaniasis, unspecified**

**1F55**

**Naegleriasis**

Any condition caused by an infection with the protozoan parasite *Naegleria*.

**1F56**

### **Rhinosporidiosis**

Rhinosporidiosis is a chronic, usually painless localised infection of the mucous membranes. Formerly believed to be a fungus, the causative agent, *Rhinosporidium seeberi*, has also never been cultured. With 18S rDNA sequencing, this organism has been shown to be a protistan parasite. Rhinosporidiosis occurs worldwide, and the greatest numbers of cases are found in southern India and Sri Lanka.

**1F57**

### **Toxoplasmosis**

A disease caused by an infection with the protozoan parasite *Toxoplasma gondii*. This disease is characterised by fever, lymphadenitis, sore throat, or rash. Transmission is by direct ingestion of contaminated food, indirectly by food or water contaminated with infected cat faeces, or vertical transmission. Confirmation is by detection of antibodies against *Toxoplasma gondii*, or identification of *Toxoplasma gondii* in tissue, cerebrospinal fluid, blood, or other body fluids.

**Coded Elsewhere:** Congenital toxoplasmosis (KA64.0)

**1F57.0**

#### **Hepatitis due to *Toxoplasma gondii***

A disease of the liver, caused by an infection with the protozoan parasite *Toxoplasma gondii*. This disease is characterised by jaundice. Transmission is by haematogenous spread to the liver after direct ingestion of contaminated food, or indirect transmission by consumption of food or water contaminated with infected cat faeces. Confirmation is by detection of antibodies against *Toxoplasma gondii* in a blood sample or identification of *Toxoplasma gondii* in hepatic tissue.

**1F57.1**

#### **Meningoencephalitis due to *Toxoplasma gondii***

A disease of the meninges and brain, caused by an infection with the protozoan parasite *Toxoplasma gondii*. This disease is characterised by seizures, neck pain, neurological deficits, or alterations in behaviour, cognition, or consciousness. Transmission is by haematogenous spread to the meninges and brain after direct ingestion of contaminated food, or indirect transmission by consumption of food or water contaminated with infected cat faeces. Confirmation is by detection of antibodies against *Toxoplasma gondii* in cerebrospinal fluid or identification of *Toxoplasma gondii* in cerebrospinal fluid, and advanced imaging of the nervous system.

**Inclusions:** *Toxoplasma* meningoencephalitis

**1F57.2 Pulmonary toxoplasmosis due to Toxoplasma gondii**

In immunodeficient patients, toxoplasmosis most often occurs in persons with defects in T cell-mediated immunity such as those receiving corticosteroids, anti-tumour necrosis factor (TNF) therapies, or cytotoxic drugs and those with hematologic malignancies, organ transplants, or acquired immunodeficiency syndrome (AIDS).

Pulmonary toxoplasmosis in the immunodeficient patient may appear in the form of interstitial pneumonitis, necrotizing pneumonitis, consolidation, pleural effusion, or empyema, or all of these.

AIDS patients with Toxoplasma pneumonia present with cough, dyspnoea, and fever. As toxoplasmosis is generally seen only in advanced HIV infection with CD4 counts below 100, the majority of AIDS patients who develop toxoplasma pneumonia already have had previous HIV-associated opportunistic infections. In solid organ transplant patients, this is most commonly due to transplantation of a toxoplasma-seropositive lung or heart into a seronegative recipient, resulting in primary pulmonary disease. In bone marrow transplant patients, pulmonary toxoplasmosis occurs in 0.28% to 0.45% of patients. Unlike solid organ transplant patients, most of these patients have reactivation, not primary disease.

**Inclusions:** Pulmonary toxoplasmosis

**1F57.3 Eye disease due to Toxoplasma gondii**

Chorioretinitis or ocular toxoplasmosis is a relatively common manifestation of T. gondii infection. Ocular toxoplasmosis occurs when cysts deposited in or near the retina become active, producing tachyzoites. Focal necrotizing retinitis is the characteristic lesion, but retinal scars from prior reactivation are typically present.

**Inclusions:** Toxoplasma oculopathy

**1F57.Y Other specified toxoplasmosis**

**1F57.Z Toxoplasmosis, unspecified**

**1F58 Microsporidiosis**

**1F5Z Unspecified protozoal disease**

Helminthiases (1F60-1F9Z)

**Coded Elsewhere:** Parasitic duodenitis (DA51.6Y)

**Diseases due to nematodes (1F60-1F6Z)**

**1F60 Angiostrongyliasis**

A disease caused by an infection with the parasitic worm Angiostrongylus. This disease commonly presents with fever, headache, stiffness of the neck and back, tingling or painful feelings in the skin, nausea and vomiting, or may be asymptomatic. Transmission is by ingestion of larvae in contaminated food.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**1F63.Z****Capillariasis, unspecified****1F64****Dracunculiasis**

A disease resulting from drinking water contaminated with water fleas infected with larvae of the nematode *Dracunculus medinensis*. It may take up to a year from ingestion of larvae for a mature gravid female worm to migrate to the skin and discharge immature larvae on contact with water. Dracunculiasis typically manifests as an intensely pruritic papule on a lower extremity from which part of the worm may emerge. Secondary pyogenic infection is common. This may be preceded by generalised symptoms such as fever, pruritus, urticaria and oedema.

**Inclusions:** Guinea worm infestation

**1F65****Enterobiasis**

A disease of the intestine, caused by an infection with the parasitic worm *Enterobius*. This disease is characterised by inflammation of the anus, pruritus, rectal pain, or may be asymptomatic. Transmission is by the faecal-oral route or airborne transmission of the eggs from the parasitic worm. Confirmation is by identification of *Enterobius* eggs around the perianal region.

**Inclusions:** Pinworm infection  
Threadworm infection  
Oxyuriasis

**1F66****Filariasis**

infections with nematodes of the superfamily Filarioidea; presence of living worms in the body is mainly asymptomatic but the death of adult worms leads to granulomatous inflammation and permanent fibrosis; organisms of the genus *Elaeophora* infect wild elk and domestic sheep causing ischaemic necrosis of the brain, blindness, and dermatosis of the face.

**Exclusions:** Onchocerciasis (1F6A)

**1F66.0****Loiasis**

A disease caused by an infection with the parasitic worm *Loa loa*. This disease is characterised by Calabar swellings found anywhere on the body (commonly found near joints). This disease may also present with generalised itching, muscle pain, joint pain, fatigue or may be asymptomatic. Transmission is through the bite of an infected fly (genus *Chrysops*). Confirmation is by identification of adult *Loa loa* in the skin or eye, *Loa loa* microfilariae in a blood sample obtained in the day (1000 - 1400), or detection of antibodies against *Loa loa* in a blood sample.

**Inclusions:** Eye worm disease of Africa  
*Loa loa* infestation  
Calabar swelling

**1F66.1****Mansonelliasis**

A disease caused by an infection with the parasitic worm *Mansonella*. This disease is characterised by pruritus, dermal pigmentary changes, fever, or lymphadenopathy, or may be asymptomatic. Transmission is through the bite of an infected midge (genus *Culicoides*) or blackfly (genus *Simulium*). Confirmation is by identification of *Mansonella* microfilariae in a skin or blood sample.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>1F66.3</b>  | <b>Lymphatic filariasis</b><br>Infestation by filarial nematodes of the genera <i>Wuchereria</i> and <i>Brugia</i> . It is acquired via transcutaneous injection of larvae by mosquitoes previously infested with microfilariae from the blood of a human host. The adult worms live in the lymphatics but release microfilariae into the bloodstream to complete the life cycle of the parasite. Clinical disease occurs in only a minority of those infected. In the acute stage this may present as an acute painful adenolymphangitis with fever. Chronic infestation causes progressive obstruction of lymphatic vessels and can result in disfiguring lymphoedema (elephantiasis), particularly of the genitalia and lower extremities.<br><b>Exclusions:</b> Lymphoedema due to lymphatic filariasis (BD93.13) |
| <b>1F66.30</b> | Filariasis due to <i>Wuchereria bancrofti</i><br>This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily Filarioidea, also known as "filariae".<br><b>Inclusions:</b> Bancroftian filariasis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>1F66.31</b> | Filariasis due to <i>Brugia malayi</i><br>This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily Filarioidea, also known as "filariae". This diagnosis is due to a nematode (roundworm), one of the three causative agents of lymphatic filariasis in humans.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>1F66.32</b> | Filariasis due to <i>Brugia timori</i><br>This is a parasitic disease (usually an infectious tropical disease) that is caused by thread-like nematodes (roundworms) belonging to the superfamily Filarioidea, also known as "filariae". This diagnosis is due to a human filarial parasitic nematode (roundworm) which causes the disease "Timor filariasis."                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>1F66.3Z</b> | Lymphatic filariasis, unspecified                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>1F66.4</b>  | <b>Subcutaneous dirofilariasis</b><br>Subcutaneous dirofilariasis normally results from the transmission of microfilariae of <i>Dirofilaria repens</i> from the latter's natural animal host to man via a mosquito bite. The adult worm cannot develop fully in man but typically manifests as a subcutaneous nodule, commonly located on or around the eyelids.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>1F66.Y</b>  | <b>Other specified filariasis</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>1F66.Z</b>  | <b>Filariasis, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**1F67****Gnathostomiasis**

A disease caused by an infection with the parasitic worm *Gnathostoma*. This disease is characterised by painful, itchy swelling under the skin from movement of the parasite under the skin. This disease may also initially present with fever, lethargy, abdominal pain, vomiting, or diarrhoea, and may infect other parts of the body (lungs, bladder, eyes, ears, nervous system). Transmission is commonly by ingestion of undercooked contaminated freshwater fish, eels, frogs, birds, or reptiles, or ingestion of contaminated water. Confirmation is commonly by detection of antibodies against *Gnathostoma*, identification of migratory skin lesions, eosinophilia, and history of potential exposure.

**Inclusions:** Wandering swelling

**1F68****Hookworm diseases**

A disease caused by an infection with the parasitic worm *Ancylostoma*. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, bloody diarrhoea, fatigue, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae), ingestion of larvae, or vertical transmission. Confirmation is by identification of *Ancylostoma* in a faecal sample.

**Inclusions:** Hook-worm infestation by *Ancylostoma*

**Coded Elsewhere:** Eosinophilic enteritis due to *Ancylostoma* (1F9Z)

**1F68.0****Ancylostomiasis**

A disease caused by an infection with the parasitic hookworm *Ancylostoma duodenale*. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, bloody diarrhoea, fatigue, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae), ingestion of larvae, or vertical transmission. Confirmation is by identification of *Ancylostoma duodenale* in a faecal sample.

**1F68.1****Necatoriasis**

A disease caused by an infection with the parasitic worm *Necator americanus*. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, arthralgia, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae). Confirmation is by identification of *Necator americanus* in a faecal sample.

**Inclusions:** Infection due to *Necator americanus*

**1F68.2****Cutaneous larva migrans**

A disease caused by an infection with the parasitic worm larvae, commonly *Ancylostoma braziliense*, *A. caninum*, or *Uncinaria stenocephala*. This disease is characterised by intense pruritus and erythematous, serpiginous lesions due to migration of parasitic larvae in the upper dermis where the larvae penetrate the skin. Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae).

**1F69****Oesophagostomiasis**

This refers to an inflammation of small intestine caused by infection due to a nematode called *Oesophagostomum bifurcum*.

**1F6A****Onchocerciasis**

Any condition caused by an infection with the parasitic worm *Onchocerca volvulus*. These conditions are characterised by the presence of firm subcutaneous nodules filled with adult worms, pruritus, long-term corneal inflammation (keratitis), or thickening of the corneal stroma. If untreated, these infections will lead to blindness. Transmission is through the bite of an infected *Simulium* fly.

**1F6A.0****Onchocerciasis of the eye**

A disease of the eye, caused by an infection with the parasitic worm *Onchocerca volvulus*. This disease is characterised by transient punctate keratitis, or potentially blinding conditions (such as sclerosing keratitis, iridocyclitis, or optic atrophy). Transmission is through the bite of an infected *Simulium* fly. Confirmation is by identification of *Onchocerca volvulus* from the anterior chamber of the eye.

**Inclusions:** Ocular onchocerciasis

**1F6A.1****Onchocerciasis of the skin**

A disease of the skin, caused by an infection with the parasitic worm *Onchocerca volvulus*. This disease is characterised by subcutaneous nodules on the skin (commonly affecting the iliac crests, ribs, knees, or trochanters). Transmission is through the bite of an infected *Simulium* fly. Confirmation is by identification of *Onchocerca volvulus* in a skin sample.

**Inclusions:** Cutaneous onchocerciasis

**1F6A.Y****Other specified onchocerciasis****1F6A.Z****Onchocerciasis, unspecified****1F6B****Strongyloidiasis**

A disease caused by the parasitic worm *Strongyloides*. This disease presents with symptoms depending on the site of infection (gastrointestinal tract, pulmonary system, dermis, or systemic), or may be asymptomatic. Transmission is by direct contact through penetration of the skin (generally the feet) with larvae from faecally contaminated soil, or autoinfection of an established infection. Confirmation is by identification of *Strongyloides* larvae in faecal samples, duodenal fluid samples, sputum, pleural fluid, or tissue samples.

**Exclusions:** Trichostrongyliasis (1F6F)

**1F6C**

### **Syngamosis**

A disease caused by an infection with the parasitic worm *Mammomonogamus*. This disease is characterised by chronic nonproductive cough, crawling sensation in the throat, wheezing, or difficulties breathing. Transmission may be by ingestion of adult worms or eggs in contaminated food or water. Confirmation is by identification of adult *Mammomonogamus* by direct visualization, or identification of *Mammomonogamus* eggs in sputum or faecal samples.

**1F6D**

### **Toxocariasis**

A condition caused by an infection with the parasitic worm *Toxocara*. In ocular infections, this condition is characterised by vision loss or inflammation of the eye; in visceral infections, this condition is characterised by fever, coughing, enlarged liver, or pneumonia. This condition may also be asymptomatic. Transmission is by the faecal-oral route through the ingestion of food, water, or soil that contains *Toxocara* eggs (contaminated by faeces from an infected dog or cat). Confirmation is by detection of antibodies against *Toxocara* in a blood sample.

**Inclusions:** *Toxocara* infestation

**1F6E**

### **Trichinosis**

A disease caused by an infection with the parasitic worm *Trichinella*. This disease is characterised by fever, nausea, diarrhoea, vomiting, fatigue, or abdominal discomfort. This disease may also present with headache, chills, cough, swelling of the face and eyes, or aching joints and muscle pains. Transmission is by ingestion of contaminated meat. Confirmation is by detection of antibodies against *Trichinella* in a blood sample.

**1F6F**

### **Trichostrongyliasis**

A disease caused by an infection with the parasitic worm *Trichostrongylus*. This disease is characterised by abdominal pain, diarrhoea, weight loss, or may be asymptomatic. Transmission is by ingestion of contaminated food or water. Confirmation is by identification of *Trichostrongylus* eggs in a faecal sample.

**1F6G**

### **Trichuriasis**

A disease of the small intestine, caused by an infection with the parasitic worm *Trichuris trichiura*. This disease is commonly asymptomatic. This disease may also present with painful diarrhoea (containing a mixture of mucus, water, or blood). Transmission is by the faecal-oral route. Confirmation is by identification of *Trichuris trichiura* eggs in a faecal sample.

**Inclusions:** *Trichocephaliasis*

**1F6H**

### **Uncinariasis**

A disease caused by an infection with the parasitic worm *Uncinaria stenocephala*. This disease is characterised by pruritus at the site of larval penetration. In mild infections, this disease may be asymptomatic; in moderate to severe infections, this disease may present with cough, pharyngeal irritation during larval migration in airways, iron-deficiency anaemia, abdominal pain, nausea, arthralgia, or delayed development (mental or physical). Transmission is by direct contact with larvae from soil or sand contaminated with dog or cat faeces (by percutaneous migration of larvae). Confirmation is by identification of *Uncinaria stenocephala* in a faecal sample.

**1F6Y****Other specified diseases due to nematodes****1F6Z****Diseases due to nematodes, unspecified****Diseases due to cestodes (1F70-1F7Z)****1F70****Cysticercosis**

A disease caused by an infection of tissue with larval cysts from the parasitic worm *Taenia solium*. This disease presents with symptoms depending on the site of infection (central nervous system, eye, or muscle). Transmission is through haematogenous spread of larvae to affected tissue after ingestion of *Taenia solium* eggs (or proglottids) in contaminated food or water. Confirmation is commonly by detection of antibodies against *Taenia solium* in a blood sample, cerebrospinal fluid, or faeces, and by advanced imaging of affected tissue.

**Inclusions:** cysticerciasis infection due to larval form of *Taenia solium*

**Coded Elsewhere:** Encephalitis due to cysticercosis (1F70.0Y)

Cysticercosis of orbit (9A21.Y)

**1F70.0****Cysticercosis of central nervous system**

A disease of the central nervous system, caused by an infection of tissue with larval cysts from the parasitic worm *Taenia solium*. This disease presents with symptoms depending on the site of infection, the number and size of cysts, and the individual's immune status. This disease may present with epilepsy, chronic headache, hydrocephalus, neurological deficits, or may be asymptomatic. Transmission is by haematogenous spread of larvae to the central nervous system after ingestion of *Taenia solium* eggs in contaminated food or water. Confirmation is by detection of antibodies against *Taenia solium* in a blood sample, or cerebrospinal fluid and advanced imaging of the brain.

**1F70.00****Meningitis due to Cysticercosis**

A disease of the meninges, caused by an infection with larval cysts from the parasitic worm *Taenia solium*. This disease is characterised by headache, fever, seizures, or neurological deficits. Transmission is through hematogenous spread of larvae to the meninges after ingestion of *Taenia solium* eggs (or proglottids) in contaminated food or water. Confirmation is by advanced imaging and detection of antibodies against *Taenia solium* from serum or cerebrospinal fluid.

**1F70.0Y****Other specified cysticercosis of central nervous system****1F70.1****Cysticercosis of eye**

A disease of the eye, caused by an infection of tissue with larval cysts from the parasitic worm *Taenia solium*. This disease is characterised by cysts floating in the vitreous humour of the eye leading to impaired vision. Transmission is by haematogenous spread of larvae to the eye after ingestion of *Taenia solium* eggs in contaminated food or water. Confirmation is commonly by history of travel in parasite endemic regions and advanced imaging of the eye.

**1F70.Y****Other specified cysticercosis****1F70.Z****Cysticercosis, unspecified**

**1F71****Diphyllbothriasis**

A disease caused by an infection with the parasitic worm *Diphyllbothrium*. This disease is characterised by abdominal discomfort, diarrhoea, vomiting, or weight loss. This disease may be asymptomatic. Transmission is by ingestion of infected undercooked fish. Confirmation is by identification of *Diphyllbothriasis* eggs in a faecal sample.

**Exclusions:** larval diphyllbothriasis (1F75)

**1F72****Dipylidiasis**

A condition caused by an infection with the parasitic worm *Dipylidium caninum*. This condition is commonly present with abdominal pain, diarrhoea, anal pruritus, or may be asymptomatic. Transmission is by ingestion of an infected flea. Confirmation is by identification of *Dipylidium caninum* eggs in a faecal sample.

**1F73****Echinococcosis**

**Inclusions:** Hydatidosis

**1F73.0****Echinococcus infection of liver****1F73.1****Echinococcus infection of lung****1F73.2****Echinococcus infection of bone****1F73.3****Echinococcus infection of central nervous system****1F73.Y****Other specified echinococcosis****1F73.Z****Echinococcosis, unspecified****1F74****Hymenolepiasis**

A disease caused by an infection with the parasitic worm *Hymenolepis*. This disease is commonly asymptomatic. This disease may present with nausea, weakness, abdominal pain, diarrhoea, or vomiting. Transmission is by the ingestion of eggs commonly in contaminated food or water, or ingestion of infected arthropods. Confirmation is by identification of *Hymenolepis* eggs in a faecal sample.

**1F75****Sparganosis**

A disease caused by an infection with the parasitic worm *Spirometra*. This disease presents with symptoms depending on the site of the infection. Transmission is by ingestion of contaminated water or ingestion of infected undercooked second intermediate hosts (such as fish, reptiles or amphibians). Confirmation is by identification of *Spirometra* eggs in a faecal sample.

**Inclusions:** Larval diphyllbothriasis  
Spirometrosis

**1F76****Taeniasis**

A disease of the intestines, caused by an infection with the adult parasitic worm *Taenia*. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked beef or pork. Confirmation is by identification of *Taenia* eggs or proglottids in faecal samples (samples from multiple days).

**Exclusions:** Cysticercosis (1F70)

**1F76.0****Taeniasis due to *Taenia solium***

A disease of the intestines, caused by an infection with the adult parasitic worm *Taenia solium*. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked pork. Confirmation is by identification of *Taenia solium* eggs or proglottidis in faecal samples (samples from multiple days).

**Inclusions:** *Taenia solium* taeniasis

**1F76.1****Taeniasis due to *Taenia saginata***

A disease of the intestines, caused by an infection with the adult parasitic worm *Taenia saginata*. This disease is characterised by abdominal pain, weight loss, diarrhoea, constipation, or may be asymptomatic. Transmission is by ingestion of larval cysts in undercooked beef. Confirmation is by identification of *Taenia saginata* eggs or proglottids in faecal samples (samples from multiple days).

**Inclusions:** Infection due to adult tapeworm *Taenia saginata*  
*Taenia saginata* taeniasis

**1F76.Y****Other specified taeniasis****1F76.Z****Taeniasis, unspecified****1F7Y****Other specified diseases due to cestodes****1F7Z****Diseases due to cestodes, unspecified****Diseases due to trematodes (1F80-1F8Z)****1F80****Clonorchiasis**

A condition caused by an infection with the parasitic worm *Clonorchis sinensis*. This condition commonly presents with inflammation and obstruction of the biliary ducts. This condition may also present with abdominal pain, nausea, or diarrhoea. Transmission is commonly by ingestion of undercooked fish infected with parasitic cysts. Confirmation is by identification of *Clonorchis sinensis* eggs in a faecal sample.

**Inclusions:** Chinese liver fluke disease  
 Oriental liver fluke disease  
 Infection due to *Clonorchis sinensis*

**1F81****Dicrocoeliasis**

A disease caused by an infection with the parasitic worm *Dicrocoelium dendriticum*. This disease is commonly asymptomatic. This disease may present with cholecystitis, liver abscesses, or upper abdominal pain. Transmission is by ingestion of infected ants. Confirmation is by identification of *Dicrocoelium dendriticum* eggs in a faecal sample or duodenal fluid.

**Inclusions:** Lancet fluke infection

**1F82****Fascioliasis**

A disease of the hepatic system, caused by an infection with the parasitic worm *Fasciola*. In the acute phase, this disease is characterised by upper abdominal pain, fever, urticaria, shortness of breath, nausea, or vomiting due to migration of the parasite from the intestines to the liver. In the chronic phase, this disease is characterised by cholestasis, cholangitis, pancreatitis, or gallstones. This disease may be asymptomatic. Transmission is by ingestion of undercooked contaminated aquatic plants or contaminated water. Confirmation is commonly by identification of *Fasciola* eggs in a faecal sample (after the individual has followed a liver-free diet prior to testing), or detection of antibodies against *Fasciola*.

**Inclusions:** Sheep liver fluke disease

**1F83****Fasciolopsiasis**

A disease caused by an infection with the parasitic worm *Fasciolopsis buski*. This disease is characterised by abdominal pain or diarrhoea, or may be asymptomatic. This disease may also present with oedema of the face, abdomen, or legs, vomiting, anorexia, or intestinal obstruction. Transmission is by ingestion of undercooked contaminated aquatic plants. Confirmation is by identification of *Fasciolopsis buski* eggs in a faecal sample.

**1F84****Opisthorchiasis**

A disease caused by an infection with the parasitic worm *Opisthorchis*. This disease is commonly asymptomatic. In mild cases, this disease may present with dyspepsia, abdominal pain, diarrhoea, or constipation; in severe cases, this disease may present with hepatomegaly and malnutrition; in rare cases, this disease may present with cholangitis, cholecystitis, and cholangiocarcinoma. Transmission is by ingestion of infected undercooked freshwater fish. Confirmation is by identification *Opisthorchis* in a faecal sample.

**1F85****Paragonimiasis**

A disease caused by an infection with the parasitic worm *Paragonimus*. This disease is characterised by cough or haemoptysis, or may be asymptomatic. This disease may present with other symptoms depending on the site where the parasite migrates to. Transmission is commonly by ingestion of undercooked contaminated crustaceans (crab or crayfish). Confirmation is commonly by identification of *Paragonimus* eggs in a sputum or faecal sample.

**Inclusions:** lung fluke disease  
infection due to *paragonimus* species  
Infestation due to *Paragonimus* species

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>1F91</b> | <b>Diphyllobothriasis and sparganosis</b><br>Diphyllobothriasis is defined as infection with the cestode <i>Diphyllobothrium latum</i> or other <i>Diphyllobothrium</i> species, which occurs accidentally in humans who ingest water containing infected cyclops, eating raw or inadequately cooked flesh. Manifestations may include abdominal discomfort, diarrhoea, vomiting and megaloblastic anaemia. Massive infections may result in intestinal obstruction. |

| <b>1G00</b>   | <b>Pediculosis</b><br>A condition of the skin, hair, or genital region caused by an infection with the parasite <i>Pediculus</i> . This disease is characterised by pruritus. This condition also presents with symptoms depending on the site of infection. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of <i>Pediculus</i> .                                                   |
| <b>1G00.0</b> | <b>Pediculosis capitis</b><br>A condition of the scalp and hair shaft, caused by an infection with the parasite <i>Pediculus humanus capitis</i> . This condition is characterised by pruritus which may lead to sores or thickened discoloured skin. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of <i>Pediculus humanus capitis</i> eggs or <i>Pediculus humanus capitis</i> . |
| <b>1G00.1</b> | <b>Pediculosis corporis</b><br>A condition of the skin, caused by an infection with the parasite <i>Pediculus humanus corporis</i> . This condition is characterised by pruritus which may lead to sores or thickened discoloured skin. Transmission is by direct or indirect contact with an infected individual or animal. Confirmation is by identification of <i>Pediculus humanus corporis</i> eggs or <i>Pediculus humanus corporis</i> .             |
| <b>1G00.Z</b> | <b>Pediculosis of unspecified site or type</b>                                                                                                                                                                                                                                                                                                                                                                                                              |

**1G01****Myiasis**

A disease of the tissues, caused by an infection with fly larvae from the order Diptera. This disease is characterised by a lump developing in the tissue. Transmission is by ingestion of contaminated larvae, direct contact with an infected mosquito, tick, fly, or indirect contact with infected fly eggs. Confirmation is by identification of Diptera from a tissue sample.

**Inclusions:** infestation by larvae of flies

**1G01.0****Ocular myiasis**

A disease of the eye, caused by an infection with fly larvae from the order Diptera. This disease is characterised by a lump developing in the tissue. Transmission is by ingestion of contaminated larvae, direct contact with an infected mosquito, tick, fly, or indirect contact with infected fly eggs. Confirmation is by identification of Diptera.

**1G01.1****Nasopharyngeal myiasis****1G01.2****Laryngeal myiasis****1G01.3****Cutaneous myiasis**

The infestation of the skin or subcutaneous tissues by the larvae of certain flies (*Phormia regina*, *Cordylobia anthropophaga*, *Cochliomyia hominivorax*, *C. macellaria*, *Wohlfahrtia vigil*, *W. meigeni*, *W. opaca*, *Dermatobia hominis*, *Sarcophaga krameri*), characterised by a painful boil-like lesion containing one or more larvae with severe pruritus and local destruction of tissue.

**1G01.Y****Other specified myiasis****1G01.Z****Myiasis, unspecified****1G02****External hirudiniasis**

Infestation of the skin by leeches. Sensitisation to antigenic substances deposited in the skin can result in urticarial weals and bullae.

**Exclusions:** Internal hirudiniasis (1F60-1F9Z)

**1G03****Pthiriasis**

Infestation most commonly of pubic hair and less commonly of body hair or eyelashes by the crab louse, *Pthirus pubis*. Transmission is by direct, typically sexual contact with an infected individual. Confirmation is by identification of *Pthirus pubis* or its eggs.

**Inclusions:** Infestation by crab lice

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>1G04</b>   | <b>Scabies</b> <p>A highly contagious infestation of the skin by the mite <i>Sarcoptes scabiei</i> var. <i>hominis</i>. It may result in epidemics when introduced into institutions such as schools and nursing homes. The mites burrow into the skin, favouring the extremities, genitalia and, in infants, the axillae. The characteristic widespread intensely pruritic papulovesicular rash results largely from the host response rather than directly to burrowing by mites. Where such a response is absent as in immunosuppressed or debilitated patients, unchecked proliferation of mites results in crusted scabies. Sarcoptic mites from other mammals such as dogs may cause a transient pruritic eruption.</p> |
| <b>1G04.0</b> | <b>Classical scabies</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>1G04.1</b> | <b>Crusted scabies</b> <p>Crusted scabies results from unchecked proliferation of the human scabies mite in individuals who are unable to mount an adequate immune response to infestation. Extensive thick crusts containing vast numbers of mites form over the skin, particularly of the extremities. Because itching is usually absent, the diagnosis is frequently overlooked. Patients with crusted scabies may serve as the source for widespread outbreaks of scabies in institutions such as hospitals and care homes.</p>                                                                                                                                                                                           |
| <b>1G04.Y</b> | <b>Other and unspecified scabies</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>1G05</b>   | <b>Tungiasis</b> <p>A disease of the skin, caused by an infection with the parasite <i>Tunga penetrans</i>. This disease is characterised by lesions (white patch with a black dot in the middle), skin inflammation, or pruritus surrounding the lesion. This disease may also be asymptomatic. Transmission is through the bite of an infected flea, or by direct contact with an infected animal. Confirmation is by identification of <i>Tunga penetrans</i> or travel history.</p>                                                                                                                                                                                                                                       |
| <b>1G06</b>   | <b>Cimicosis</b> <p>Infestation by bedbugs, which are blood-sucking temporary ectoparasites. The most common species to attack humans is <i>Cimex lectularius</i>. In individuals who are not sensitized by previous exposure, there may be no symptoms or signs other than purpuric macules at the sites of bites. Weals, papules or bullae may occur in sensitized individuals.</p>                                                                                                                                                                                                                                                                                                                                         |
| <b>1G07</b>   | <b>Infestation by mites</b> <p><b>Coded Elsewhere:</b> Scabies (1G04)<br/>Cutaneous reactions to zoonotic mites (NE61)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>1G07.0</b> | <b>Infestation by Demodex</b> <p>Infestation with <i>Demodex</i> mites. <i>Demodex folliculorum</i> is a saprophytic mite of the human pilosebaceous unit with a predilection for facial skin and eyelashes. <i>Demodex brevis</i> is found in the sebaceous glands of the eyelash follicle and in the lobules of eyelid meibomian glands. Although infestation is very common and normally symptomless, the mites have been linked to papulopustular rosacea and chronic blepharitis.</p>                                                                                                                                                                                                                                    |

## Sepsis (1G40-1G41)

**Coding Note:** Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

**Exclusions:**

- Plague (1B93)
- Acute or fulminant melioidosis (1C42)
- Tularaemia (1B94)
- Other infection during labour (JB0D)
- Injury or harm arising following infusion, transfusion or therapeutic injection, not elsewhere classified (NE80)
- Genital tract or pelvic infection following abortion, ectopic or molar pregnancy (JA05.0)
- Disseminated gonococcal infection (1A73)
- Extraintestinal yersiniosis (1B9A)
- Injury or harm arising from a procedure, not elsewhere classified (NE81)
- Meningococcal disease (1C1C)
- Systemic inflammatory response syndrome of noninfectious origin (MG46)

**Coded Elsewhere:**

- Puerperal sepsis (JB40.0)
- Sepsis of fetus or newborn (KA60)
- Obstetric pyaemic or septic embolism (JB42.3)

## **1G40 Sepsis without septic shock**

Sepsis is defined as a life-threatening organ dysfunction caused by a dysregulated host response to infection.

**Coding Note:** Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

**Exclusions:**

- Septicaemia (MA15.0)
- Sepsis of fetus or newborn (KA60)

**1G41****Sepsis with septic shock**

Septic shock is a subset of sepsis in which circulatory, cellular and metabolic abnormalities are profound enough to substantially increase mortality.

**Coding Note:**

Any type of infection - bacterial, viral, fungal or protozoal, can cause sepsis and must be coded as well. When the site of infection is unknown, select a code for Infection of unspecified site by organism followed by the appropriate code for sepsis.

**Exclusions:**

Sepsis of fetus or newborn (KA60)

Septicaemia (MA15.0)

**1G60****Certain other disorders of infectious origin**

Miscellaneous disorders of infectious origin not classifiable elsewhere including those due to algae and oomycetes

**1G60.0****Mycetoma of unknown or unspecified type**

Mycetoma is a destructive localised chronic infection of skin, subcutaneous tissue and bone, most commonly affecting the foot. It can be caused by either fungi (eumycetoma) or filamentous bacteria (actinomycetoma). Where possible it should be classified more precisely as either actinomycetoma, the commonest type, or eumycetoma

**Exclusions:**

Actinomycetoma (1C43)

Eumycetoma (1F29)

**1G60.1****Pythiosis**

Pythiosis is a life-threatening infection by the oömycete *Pythium insidiosum*. Although infection in animals occurs widely across the world, human pythiosis is largely confined to Thailand and, with the exception of ocular disease, is closely associated with underlying haematological disease, especially thalassaemia. There is a high mortality in patients with disseminated or vascular disease. In the latter form, invasion of arterial wall results in vascular occlusion and a frequent need for amputation. Patients with ocular pythiosis commonly require enucleation. A small proportion of infections are limited to the skin and subcutaneous tissues.

**1G60.2****Protothecosis**

Protothecosis is a rare opportunistic infection in humans caused by achloric algae of the genus *Prototheca*. The infection is usually localised and may be associated with antecedent local trauma. It is generally located on exposed sites and remains confined to skin and subcutaneous tissues. In immunocompromised patients, however, widespread cutaneous, subcutaneous or deep infection may occur.

**1G60.Y****Other specified disorders of infectious origin not elsewhere classified**

## Sequelae of infectious diseases (1G80-1G8Y)

A sequela is a chronic condition resulting from an acute condition and begins during that acute condition. The acute condition is no longer present. The sequela continues after the acute phase of the condition is resolved. For infectious diseases, the original infection is no longer present.

The sequelae categories indicate infections as the cause of sequelae which are themselves classified elsewhere.

Not to be used for chronic infections. Code the chronic infection to chronic or active infectious disease as appropriate.

Use an additional code, if desired, to identify the specific sequelae.

**Coded Elsewhere:** Sequelae of inflammatory diseases of central nervous system (1D0Y)

### 1G80

#### Sequelae of tuberculosis

Sequela of tuberculosis is a chronic condition resulting from acute tuberculosis. *Mycobacterium tuberculosis* is no longer active. The sequela continues after the acute phase is resolved.

### 1G81

#### Sequelae of trachoma

This refers to a pathological condition resulting from an infectious disease caused by the *Chlamydia trachomatis* bacterium which produces a characteristic roughening of the inner surface of the eyelids.

### 1G82

#### Sequelae of leprosy

This refers to a pathological condition resulting from a chronic disease caused by the bacteria *Mycobacterium leprae* and *Mycobacterium lepromatosis*.

### 1G83

#### Sequelae of poliomyelitis

Sequelae of poliomyelitis refers to the residuals of acute poliomyelitis as well as other disorders that have an etiological link to either the acute polio infection or to chronic deficits resulting from the acute infection. Disorders that may manifest late in the lives of polio survivors include early advanced degenerative arthritis, sleep disorders, respiratory insufficiency, and a variety of mental disorders.

**Exclusions:** Post polio progressive muscular atrophy (8B62)

### 1G84

#### Sequelae of viral encephalitis

### 1G85

#### Sequelae of diphtheria

This refers to conditions that develop as a consequence of a bacterial infection of the respiratory tract with *Corynebacterium diphtheriae*.

### 1G8Y

#### Sequelae of other specified infectious diseases

### 1H0Z

#### Infection, unspecified

# CHAPTER 02

---

## Neoplasms

This chapter has 325 four-character categories.

Code range starts with 2A00

An abnormal or uncontrolled cellular proliferation which is not coordinated with an organism's requirements for normal tissue growth, replacement or repair.

**Coded Elsewhere:** Inherited cancer-predisposing syndromes

This chapter contains the following top level blocks:

- Neoplasms of brain or central nervous system
- Neoplasms of haematopoietic or lymphoid tissues
- Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues
- In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues
- Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues
- Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues
- Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues
- Inherited cancer-predisposing syndromes

### Neoplasms of brain or central nervous system (2A00-2A0Z)

A benign or malignant neoplasm that affects the brain, meninges, or spinal cord. Representative examples of primary neoplasms include astrocytoma, oligodendroglioma, ependymoma, and meningioma.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>2A00.3</b>  | <p><b>Central neurocytoma of brain</b></p> <p>Central neurocytoma is a very rare brain tumour of young adults. It is typically found in the lateral ventricles and occasionally in the third ventricle. Symptoms are those of increased intracranial pressure.</p>                                                                                                                                                                                                                                       |
| <b>2A00.4</b>  | <p><b>Astroblastoma of the brain</b></p> <p>A rare glial neoplasm more commonly found in young adults. It is characterised by tumour cells with characteristics suggestive of an astrocytic origin (positive for GFAP), arranged perivascularly. The cells have broad, non-tapering processes radiating towards a central blood vessel. The biologic behaviour of astroblastomas is variable, so no WHO grade has been established, yet.</p>                                                             |

## Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

A neoplasm arising from hematopoietic cells found in the bone marrow, peripheral blood, lymph nodes and spleen (organs of the hematopoietic system). Hematopoietic cell neoplasms can also involve other anatomic sites (e.g. central nervous system, gastrointestinal tract), either by haematogenous spread, direct tumour infiltration, or neoplastic transformation of extranodal lymphoid tissues. The commonest forms are the various types of leukaemia, Hodgkin and non-Hodgkin lymphomas, myeloproliferative neoplasms and myelodysplastic syndromes.

### Myeloproliferative neoplasms (2A20-2A22)

| <b>2A20.3</b>  | <b>Chronic eosinophilic leukaemia, not elsewhere classified</b><br>A chronic myeloproliferative neoplasm characterised by persistent eosinophilia in the blood, bone marrow and peripheral tissues. Organ damage occurs as a result of leukaemic infiltration or the release of cytokines, enzymes or other proteins by the eosinophils. Chronic eosinophilic leukaemia, not otherwise specified excludes patients with a Ph chromosome, BCR-ABL1 fusion gene or rearrangement of PDGFRA, PDGFRB or FGFR1. |

| <b>2A21</b>    | <b>Mastocytosis</b><br>Mastocytosis is due to a clonal, neoplastic proliferation of mast cells that accumulate in one or more organ systems. Activating mutations of KIT are frequently found. It is characterised by the presence of multifocal compact clusters or cohesive aggregates/infiltrates of abnormal mast cells. The disorder is heterogeneous, ranging from skin lesions that may spontaneously regress to highly aggressive neoplasms associated with multiorgan failure and short survival. Subtypes of mastocytosis are recognised mainly by the distribution of the disease and clinical manifestations. In cutaneous mastocytosis (CM), the mast cell infiltration remains confined to the skin, whereas systemic mastocytosis (SM) is characterised by involvement of at least one extracutaneous organ with or without evidence of skin lesions. Mastocytosis should be strictly separated from mast cell hyperplasia or mast cell activation states without morphological and/or molecular abnormalities that characterize the neoplastic proliferation. |
| <b>2A21.0</b>  | <b>Systemic mastocytosis</b><br>Systemic mastocytosis (SM) comprises a heterogeneous group of rare acquired and chronic haematological malignancies that are related to an abnormal proliferation of mast cells in tissue, including bone marrow, with or without skin involvement. SM can be divided into indolent SM (ISM) and aggressive SM (ASM).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>2A21.1</b>  | <b>Cutaneous mastocytosis</b><br>Cutaneous mastocytosis is characterised by abnormal accumulation and proliferation of cutaneous mast cells. Most types are isolated but cutaneous mastocytosis can occur in association with systemic disease. Clinical forms include cutaneous mastocytoma, urticaria pigmentosa (the most frequent form), pseudoxanthomatous nodular cutaneous mastocytosis, telangiectasia macularis eruptiva perstans and diffuse cutaneous mastocytosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### Myelodysplastic syndromes (2A30-2A3Z)

Clonal hematopoietic disorders characterised by dysplasia and ineffective hematopoiesis in one or more of the hematopoietic cell lines. The dysplasia may be accompanied by an increase in myeloblasts, but the number is less than 20% in marrow and blood, which, according to the WHO guidelines, is the requisite threshold for the diagnosis of acute myeloid leukaemia.

*Exclusions:* Therapy-related myeloid neoplasms (2A60.2)  
Drug-induced aplastic anaemia (3A70.10)

| <b>2A33</b> | <b>Refractory anaemia with ring sideroblasts</b><br>A myelodysplastic syndrome characterised by an anaemia in which 15% or more of the erythroid precursors are ringed sideroblasts. The ring sideroblast is an erythroid precursor in which one third or more of the nucleus is encircled by granules which are positive for iron stain. |
| <b>2A34</b> | <b>Refractory cytopenia with multi-lineage dysplasia</b><br>A myelodysplastic syndrome characterised by bi-cytopenia or pancytopenia and dysplastic changes in 10% or more of the cells in two or more of the myeloid cell lines.                                                                                                         |

**2A35****Refractory anaemia with excess of blasts**

A myelodysplastic syndrome characterised by bi-cytopenia or pancytopenia and dysplastic changes in one or multiple lineages, with 5-19% myeloblasts in the bone marrow, 2-19% blasts in the blood, or <20% blasts with the presence of Auer rods.

**2A36****Myelodysplastic syndrome with isolated del(5q)**

A myelodysplastic syndrome characterised by anaemia with or without other cytopenias and/or thrombocytosis and in which the sole cytogenetic abnormality is del(5q). Myeloblasts are <5% in the bone marrow and <1% in the blood.

**Inclusions:** 5 q- syndrome

**2A37****Myelodysplastic syndrome, unclassifiable**

A subtype of myelodysplastic syndrome which at disease presentation lacks findings appropriate for classification into any other MDS category, or has an MDS-associated cytogenetic abnormality and cytopenia, but lack sufficient dysplastic changes in any lineage and have <15% ring sideroblasts.

**2A38****Refractory cytopenia of childhood**

The most common subtype of the myelodysplastic syndromes affecting children. It is characterised by persistent cytopenia with less than 5% blasts in the bone marrow and less than 2% blasts in the peripheral blood.

**2A3Y****Other specified myelodysplastic syndromes****2A3Z****Myelodysplastic syndromes, unspecified**

Myelodysplastic and myeloproliferative neoplasms (2A40-2A4Z)

A category of clonal haematopoietic disorders that have both myelodysplastic and myeloproliferative features at the time of initial presentation.

**2A40****Chronic myelomonocytic leukaemia**

A myelodysplastic/myeloproliferative neoplasm which is characterised by persistent monocytosis, absence of a Philadelphia chromosome and BCR/ABL1 fusion gene, fewer than 20 percent blasts in the bone marrow and blood, often myelodysplasia, and absence of PDGFRA or PDGFRB rearrangement.

**Inclusions:** Chronic monocytic leukaemia

**Exclusions:** Myeloid/lymphoid neoplasm associated with PDGFRA rearrangement (2A50)

Myeloid neoplasm associated with PDGFRB rearrangement (2A51)

**2A41****Atypical chronic myeloid leukaemia, BCR-ABL1-negative**

A myelodysplastic/myeloproliferative neoplasm characterised by the principal involvement of the neutrophil series with leukocytosis with circulating immature myeloid cells, fewer than 20 percent blasts in the bone marrow and blood, and severe dysgranulopoiesis. The neoplastic cells do not have a Philadelphia chromosome or the BCR/ABL1 fusion gene.

**2A42****Juvenile myelomonocytic leukaemia**

A myelodysplastic/myeloproliferative neoplasm of childhood that is characterised by proliferation principally of the granulocytic and monocytic lineages. Myelomonocytic proliferation is seen in the bone marrow and the blood. The leukemic cells may infiltrate any tissue, however liver, spleen, lymph nodes, skin, and respiratory tract are the most common sites of involvement.

**2A42.0****Juvenile myelomonocytic leukaemia in complete remission****2A42.Y****Other specified juvenile myelomonocytic leukaemia****2A42.Z****Juvenile myelomonocytic leukaemia, unspecified****2A43****Refractory anaemia with ring sideroblasts associated with marked thrombocytosis**

A provisional entity that encompasses cases with morphologic and clinical characteristics of refractory anaemia with ring sideroblasts, marked thrombocytosis, and abnormal megakaryocytes.

**2A44****Myeloproliferative and myelodysplastic disease, unclassifiable**

This entity includes cases that have clinical, laboratory, and morphologic features that support the diagnosis of both a myelodysplastic syndrome and a myeloproliferative neoplasm, but do not meet the criteria for any of the other entities included in the myelodysplastic/myeloproliferative neoplasm category.

**2A4Y****Other specified myelodysplastic and myeloproliferative neoplasms****2A4Z****Myelodysplastic and myeloproliferative neoplasms, unspecified**

Myeloid and lymphoid neoplasms with eosinophilia and abnormalities of PDGFRA, PDGFRB or FGFR1 (2A50-2A5Z)

A group of rare myeloid and lymphoid neoplasms characterised by rearrangement of the PDGFRA, PDGFRB, or FGFR1 genes, resulting in the formation of fusion transcripts and aberrant tyrosine kinase activity. Eosinophilia is a characteristic finding but it is not always present.

**2A50****Myeloid/lymphoid neoplasm associated with PDGFRA rearrangement****2A51****Myeloid neoplasm associated with PDGFRB rearrangement**

A distinct type of myeloid neoplasm that occurs in association with rearrangement of PDGFRB gene at 5q32. Patients usually present with a picture resembling chronic myelomonocytic leukaemia and, less often atypical chronic myeloid leukaemia or chronic eosinophilic leukaemia.

**2A52****Myeloid or lymphoid neoplasms with FGFR1 abnormalities**

Hematologic neoplasms characterised by the rearrangement of the FGFR1 gene, resulting in translocations with an 8p11 breakpoint. Patients may present with a myeloproliferative neoplasm, acute myeloid leukaemia, lymphoblastic lymphoma/leukaemia of T or B-cell lineage, or acute leukaemia of mixed phenotype.

- 2A60.33** Acute myelomonocytic leukaemia  
An acute leukaemia characterised by the proliferation of both neutrophil and monocyte precursors.
- 2A60.34** Acute monoblastic or monocytic leukaemia  
Acute monoblastic leukaemia and acute monocytic leukaemia are myeloid leukaemias in which 80% or more of the leukaemic cells are of monocytic lineage including monoblasts, promonocytes and monocytes; a minor neutrophil component, <20%, may be present.
- 2A60.35** Acute erythroid leukaemia  
**Inclusions:** Erythroleukaemia
- 2A60.36** Acute megakaryoblastic leukaemia  
An acute myeloid leukaemia in which at least 50% of the blasts are of megakaryocytic lineage.  
**Inclusions:** Acute myeloid leukaemia, M7  
Acute megakaryocytic leukaemia
- 2A60.37** Acute basophilic leukaemia  
An acute myeloid leukaemia in which the immature cells differentiate towards basophils. This is a rare leukaemia.
- 2A60.38** Acute panmyelosis with myelofibrosis  
An acute myeloid leukaemia characterised by bone marrow fibrosis without preexisting primary myelofibrosis.  
**Inclusions:** Acute myelofibrosis  
**Exclusions:** Cases that meet criteria for AML with myelodysplasia related changes (2A60.1)
- 2A60.39** Myeloid sarcoma  
Myeloid sarcoma is a rare solid tumour of the myelogenous cells occurring in an extramedullary site.  
**Inclusions:** Chloroma  
Granulocytic sarcoma
- 2A60.3Y** Other specified acute myeloid leukaemia, not elsewhere classified by criteria of other types
- 2A60.3Z** Acute myeloid leukaemia, unspecified
- 2A60.4** **Myeloid proliferation associated with Down syndrome**  
Myeloid neoplasms occurring in individuals with Down syndrome. There is an increased risk of acute leukaemias in both children and adults with Down syndrome. In particular, the incidence of acute myeloid leukaemia in Down syndrome children of less than five years of age is particularly high, it is usually an acute megakaryoblastic leukaemia, and is associated with GATA1 gene mutation. This group of disorders also includes the entity transient abnormal myelopoiesis which occurs in neonates and is associated with GATA1 gene mutation.

- 2A60.40** Transient abnormal myelopoiesis  
A myeloid proliferation occurring in newborns with Down syndrome. It is clinically and morphologically indistinguishable from acute myeloid leukaemia and is associated with GATA1 mutations. The blasts display morphologic and immunophenotypic features of megakaryocytic lineage. In the majority of patients the myeloid proliferation undergoes spontaneous remission.
- 2A60.41** Myeloid leukaemia associated with Down syndrome  
Leukaemia of children with Down syndrome. Encompasses both MDS and AML
- 2A60.4Y** Other specified myeloid proliferation associated with Down syndrome
- 2A60.4Z** Myeloid proliferation associated with Down syndrome, unspecified
- 2A60.5** **Blastic plasmacytoid dendritic cell neoplasm**  
Blastic plasmacytoid dendritic cell neoplasm (BPDCN) is a clinically aggressive tumour derived from the precursors of plasmacytoid dendritic cells (PDCs, also called professional type I interferon-producing cells or plasmacytoid monocytes), with a high frequency of cutaneous and bone marrow involvement and leukaemic dissemination.  
  
There are currently no clues to the etiology of BPDCN, but its association with myelodysplastic syndrome (MDS) in some cases may suggest a related pathogenesis. Gene expression profiling studies have revealed that the neoplastic cells show a gene expression signature similar to that of resting normal PDCs and closer to that of myeloid than of lymphoid precursors.  
  
**Inclusions:** blastic NK-cell lymphoma
- 2A60.Y** **Other specified acute myeloid leukaemias and related precursor neoplasms**
- 2A60.Z** **Acute myeloid leukaemias and related precursor neoplasms, unspecified**
- 2A61** **Acute leukaemias of ambiguous lineage**  
An acute leukaemia in which the blasts lack sufficient evidence to classify as myeloid or lymphoid or they have morphologic and/or immunophenotypic characteristics of both myeloid and lymphoid cells.

#### Precursor lymphoid neoplasms (2A70-2A7Z)

Neoplasms of immature malignant lymphocytes (lymphoblasts) committed to the B-cell or T-cell lineage. Neoplasms involving the bone marrow and the peripheral blood are called precursor lymphoblastic leukaemias or acute lymphoblastic leukaemias. Neoplasms involving primarily lymph nodes or extranodal sites are called lymphoblastic lymphomas.

- 2A70** **Precursor B-lymphoblastic neoplasms**  
Neoplasms of lymphoblasts committed to the B-cell lineage.

- 2A70.0** **B lymphoblastic leukaemia or lymphoma, not elsewhere classified**  
Precursor B cell neoplasm without defined recurrent genetic abnormality despite appropriate diagnostics

**2A70.1**      **B lymphoblastic leukaemia or lymphoma with t(9:22) (q34;q11.2); BCR-ABL1**  
A precursor lymphoid neoplasm which is composed of B-lymphoblasts and carries a translocation between the BCR gene on chromosome 22 and the ABL1 gene on chromosome 9. It results in the production of the p190 kd or p210 kd fusion protein. It has an unfavorable clinical outcome.

**2A70.Y**      **Other B-lymphoblastic leukaemia/lymphoma with recurrent genetic abnormalities**

**2A71**      **Precursor T-lymphoblastic neoplasms**  
A neoplasm of lymphoblasts committed to the T-cell lineage, typically composed of small to medium-sized blast cells.

**2A7Z**      **Precursor lymphoid neoplasms, unspecified**

Mature B-cell neoplasms (2A80-2A8Z)

Non-Hodgkin lymphomas that originate from mature B lymphocytes. May reside in lymph nodes, lymphatic tissue of different organs or bone marrow and blood (then frequently called leukaemia).

**2A80**      **Follicular lymphoma**  
Follicular lymphoma (FL) is a neoplasm composed of follicle centre (germinal centre) B-cells (typically both centrocytes and centroblasts/large transformed cells), which usually has at least a partially follicular pattern. t(14;18) with BCL2 rearrangement is frequently observed. If diffuse areas of any size comprised predominantly or entirely of blastic cells are present in any case of follicular lymphoma, a diagnosis of diffuse large B-cell lymphoma is also made. Lymphomas composed of centro cytes and centroblasts with an entirely diffuse pattern in the sampled tissue may be included in this category.

**Inclusions:**              follicular lymphoma with or without diffuse areas

**Exclusions:**              Mature T-cell or NK-cell neoplasms (2A90-2B2Z)

**2A80.0**      **Follicular lymphoma grade 1**

**2A80.1**      **Follicular lymphoma grade 2**

**2A80.2**      **Follicular lymphoma grade 3**

**2A80.3**      **Primary cutaneous follicle centre lymphoma**

A primary lymphoma of the skin composed of various numbers of small and large irregular neoplastic follicle center cells. Its morphologic pattern can be nodular, diffuse, or nodular and diffuse. It presents with solitary or grouped plaques and tumours, and it usually involves the scalp, forehead, or trunk. It rarely involves the legs. This type of cutaneous lymphoma tends to remain localised to the skin, and it has a favorable prognosis.

|               |                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>2A80.4</b> | <b>Paediatric type follicular lymphoma</b><br>A variant of follicular lymphoma often involving cervical or other peripheral lymph nodes and the Waldeyer ring. It is frequently localised, and often lacks BCL-2 protein expression and never has a BCL2 translocation. It is usually but not exclusively seen in the pediatric population. The prognosis is usually favorable. |
| <b>2A80.5</b> | <b>Follicular lymphoma in situ</b>                                                                                                                                                                                                                                                                                                                                              |

| <b>2A81.0</b> | <b>Primary mediastinal large B-cell lymphoma</b><br>A large B-cell non-Hodgkin lymphoma arising in the mediastinum. Morphologically it is characterised by a massive diffuse lymphocytic proliferation associated with compartmentalizing fibrosis.                                                                                                                             |
| <b>2A81.1</b> | <b>Intravascular large B-cell lymphoma</b>                                                                                                                                                                                                                                                                                                                                      |
| <b>2A81.2</b> | <b>Plasmablastic lymphoma</b><br>An aggressive diffuse large B-cell lymphoma frequently arising in the setting of HIV infection and characterised by the presence of large neoplastic cells resembling B-immunoblasts which have the immunophenotypic profile of plasma cells. Sites of involvement include the oral cavity and other extranodal sites                          |
| <b>2A81.3</b> | <b>Lymphomatoid granulomatosis</b>                                                                                                                                                                                                                                                                                                                                              |
| <b>2A81.4</b> | <b>T-cell/histiocyte rich large B-cell lymphoma</b><br>A large B-cell lymphoma characterised by the presence of a limited number of scattered neoplastic large B-lymphocytes which are admixed with numerous non-neoplastic T-lymphocytes and frequently histiocytes.                                                                                                           |
| <b>2A81.5</b> | <b>Primary diffuse large B-cell lymphoma of central nervous system</b>                                                                                                                                                                                                                                                                                                          |
| <b>2A81.6</b> | <b>Epstein-Barr Virus-positive diffuse large B-cell lymphoma of the elderly</b><br>An aggressive diffuse large B-cell lymphoma affecting patients older than 50 years. Epstein-Barr virus is present in all cases. There is no known history of immunodeficiency or prior lymphoma. The majority of patients present with extranodal disease.                                   |
| <b>2A81.7</b> | <b>Diffuse large B-cell lymphoma associated with chronic inflammation</b><br>A diffuse large B-cell lymphoma arising in body cavities or narrow spaces of long standing chronic inflammation. The classic example is the pyothorax-associated lymphoma that arises in the pleural cavity of patients with a history of long standing pyothorax.                                 |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>2A81.8</b> | <b>ALK-positive large B-cell lymphoma</b><br>A usually aggressive large B-cell lymphoma characterised by the presence of monomorphic immunoblast-like neoplastic B-lymphocytes in a sinusoidal growth pattern. The neoplastic B-lymphocytes express the ALK kinase but they lack the 2;5 translocation.                                                                                                                                                                                                                                   |
| <b>2A81.9</b> | <b>Primary effusion lymphoma</b><br>An aggressive non-Hodgkin B-cell lymphoma composed of large cells, presenting as a serous effusion without detectable tumour masses. It is universally associated with human herpes virus 8 (HHV-8)/Kaposi sarcoma herpes virus (KSHV) [HHV-8/KSHV]. It mostly occurs in the setting of immunodeficiency; most cases have been reported in HIV positive patients. The most common sites of involvement are the pleural, pericardial, and peritoneal cavities. The prognosis is extremely unfavorable. |
| <b>2A81.A</b> | <b>Primary cutaneous diffuse large B-cell lymphoma, leg type</b><br>An aggressive primary cutaneous B-cell lymphoma, usually involving the lower leg. It is composed of a generally monotonous proliferation of immunoblasts, or less frequently centroblasts, with few admixed reactive cells. This type of lymphoma occurs most often in the elderly who present with rapidly growing tumours, usually on one or both legs. Dissemination to extracutaneous sites is frequent.                                                          |
| <b>2A81.Y</b> | <b>Other specified diffuse large B-cell lymphomas</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>2A81.Z</b> | <b>Diffuse large B-cell lymphoma, not otherwise specified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>2A82.00</b> | <p>Chronic lymphocytic leukaemia of B-cell type</p> <p>Chronic lymphocytic leukaemia/small lymphocytic lymphoma (CLL/SLL) is a neoplasm composed of monomorphic small, round to slightly irregular B lymphocytes in the peripheral blood (PB), bone marrow (BM), spleen and lymph nodes, admixed with prolymphocytes and paraimmunoblasts forming proliferation centres in tissue infiltrates. The CLL/SLL cells usually coexpress CD5 and CD23. In the absence of extramedullary tissue involvement, there must be &lt;5x10<sup>9</sup>/L monoclonal lymphocytes with a CLL phenotype in the PB. The International Workshop on Chronic Lymphocytic Leukemia (IWCLL) report requires that the lymphocytosis be present for at least 3 months and also allows for the diagnosis of CLL to be made with lower lymphocyte counts in patients with cytopenias or disease-related symptoms. Whether patients who would have fulfilled the criteria in the past for CLL but who fulfill the criteria only for monoclonal B lymphocytosis (MBL) are better considered to have low stage CLL or MBL remains to be determined. Some may prefer to still consider many of these cases more like CLL. The term SLL is used for non-leukaemic cases with the tissue morphology and immunophenotype of CLL. The IWCLL definition of SLL requires lymphadenopathy, no cytopenias due to BM infiltration by CLL/SLL and &lt;5x10<sup>9</sup>/L PB B-cells.</p> <p><b>Inclusions:</b> Lymphoplasmacytic leukaemia</p> <p><b>Exclusions:</b> Lymphoplasmacytic lymphoma (2A85.4)</p> <p><b>Coded Elsewhere:</b> Richter syndrome (2A81.Y)</p> |

- 2A83.1 Plasma cell myeloma**  
 A bone marrow-based plasma cell neoplasm usually characterised by presence of a serum monoclonal protein and/or urinary light chains. "CRAB" criteria (calcium elevation (hypercalcaemia), renal failure, anaemia and bone lesions) separate symptomatic plasma cell myeloma from asymptomatic (smoldering) myeloma.
- Inclusions:** Kahler disease  
 Myelomatosis  
 Medullary plasmacytoma  
 multiple myeloma
- Exclusions:** Solitary plasmacytoma (2A83.2)
- 2A83.2 Solitary plasmacytoma**  
 A single focus of clonal (malignant) plasma cells either in the bone or in another anatomic site without peripheral blood involvement.
- Inclusions:** Solitary myeloma
- 2A83.3 Extraosseous plasmacytoma**
- 2A83.4 Plasma cell leukaemia**  
 An aggressive plasma cell neoplasm. It is characterised by the presence of neoplastic plasma cells in the peripheral blood (PB). The neoplastic plasma cells comprise more than 20% of the white cells in the PB or the number of clonal plasma cells in the PB exceeds  $2 \times 10^9/L$ .
- 2A83.5 Monoclonal immunoglobulin deposition disease**
- 2A83.50 Heavy chain deposition disease**  
 A disease of the kidney, caused by proliferation and deposition of pieces of truncated or abnormal alpha, gamma, delta, or mu immunoglobulin heavy chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identifying heavy chain deposition tissue biopsy using immunofluorescence under a microscope.
- Exclusions:** Heavy chain diseases or malignant immunoproliferative diseases (2A84)  
 Immunoglobulin heavy chain deficiency (4A01.04)
- 2A83.51 Light and heavy chain deposition disease**  
 A disease of the kidney, caused by proliferation and deposition of pieces of truncated or abnormal light and heavy chain segments of white blood cells. This disease is characterised by fibrillar or granular tissue deposits and renal dysfunction, which may lead to organ failure. Confirmation is by identification of light and heavy chain deposition tissue biopsy under a microscope.

| <b>2A85.0</b>  | <p><b>Nodal marginal zone lymphoma</b></p> <p>A primary nodal B-cell non-Hodgkin lymphoma which morphologically resembles lymph nodes involved by marginal zone lymphomas of extranodal or splenic types, but without evidence of extranodal or splenic disease. This is a rare entity, and most patients present with localised or generalised lymphadenopathy. The clinical course is indolent.</p>                                                                                                                                             |
| <b>2A85.1</b>  | <p><b>Extranodal marginal zone B-cell lymphoma of mucosa-associated lymphoid tissue of stomach</b></p> <p>A low grade, indolent B-cell lymphoma, usually associated with Helicobacter pylori infection. Morphologically it is characterised by a dense mucosal atypical lymphocytic (centrocyte-like cell) infiltrate with often prominent lymphoepithelial lesions and plasmacytic differentiation. Some of gastric MALT lymphomas carry the t(11;18)(q21;q21). Such cases are resistant to Helicobacter pylori therapy.</p>                     |

Mature T-cell or NK-cell neoplasms (2A90-2B2Z)

A group of neoplasms composed of T-lymphocytes with a mature (peripheral/post-thymic) immunophenotypic profile and/or NK-cells.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>2A90.0</b> | <p><b>T-cell prolymphocytic leukaemia</b></p> <p>An aggressive T-cell leukaemia, characterised by the proliferation of small to medium sized prolymphocytes with a mature T-cell phenotype, involving the blood, bone marrow, lymph nodes, liver, spleen, and skin.</p>                                                                                                                                                                    |
| <b>2A90.1</b> | <p><b>T-cell large granular lymphocytic leukaemia</b></p> <p>A T-cell peripheral neoplasm characterised by a persistent (&gt;6 months) increase in the number of peripheral blood large granular lymphocytes, without a clearly identified cause.</p>                                                                                                                                                                                      |
| <b>2A90.2</b> | <p><b>Chronic lymphoproliferative disorders of NK-cells</b></p> <p>Heterogeneous disorders with a chronic clinical course affecting predominantly adults and characterised by the proliferation of large granular lymphocytes with natural killer cell immunophenotype.</p>                                                                                                                                                                |
| <b>2A90.3</b> | <p><b>Aggressive NK cell leukaemia</b></p> <p>A rare, highly aggressive, Epstein-Barr virus-associated leukaemia, also known as aggressive NK-cell leukaemia/lymphoma; it may represent the leukemic counterpart of nasal type extranodal NK/T-cell lymphomas. It affects primarily teenagers and young adults. It is characterised by the systemic proliferation of NK cells in the peripheral blood, bone marrow, liver, and spleen.</p> |
| <b>2A90.4</b> | <p><b>Systemic Epstein-Barr Virus-positive T-cell lymphoma of childhood</b></p> <p>This neoplasm of childhood is characterised by a clonal proliferation of EBV-infected T-cells with an activated cytotoxic phenotype. It can occur shortly after primary acute EBV infection or in the setting of chronic active EBV infection (CAEBV).</p>                                                                                              |
| <b>2A90.5</b> | <p><b>Adult T-cell lymphoma or leukaemia, human T-cell lymphotropic virus type 1-associated</b></p> <p>A peripheral (mature) T-cell neoplasm linked to the human T-cell leukaemia virus type 1 (HTLV-1). Adult T-cell leukaemia/lymphoma is endemic in several regions of the world, in particular Japan, the Caribbean, and parts of Central Africa.</p> <p><b>Coded Elsewhere:</b> Adult T-cell leukaemia or lymphoma, skin (2B0Y)</p>   |

- 2A90.6      Extranodal NK/T-cell lymphoma, nasal type**
- An aggressive, predominantly extranodal, mature T-cell non-Hodgkin lymphoma. It is characterised by an often angiocentric and angiodestructive cellular infiltrate composed of EBV positive NK/T cells. The nasal cavity is the most common site of involvement. Patients often present with midfacial destructive lesions (lethal midline granuloma). The disease may disseminate rapidly to various anatomic sites including the gastrointestinal tract, skin, testis, and cervical lymph nodes. It is also known as angiocentric T-cell lymphoma. The term polymorphic reticulosis has been widely used to describe the morphologic changes seen in this type of lymphoma. However, the latter term may also apply to lymphomatoid granulomatosis, which is an angiocentric and angiodestructive EBV positive B-cell lymphoproliferative disorder.
- 2A90.7      Enteropathy associated T-cell lymphoma**
- An uncommon mature T-cell lymphoma of intraepithelial lymphocytes. It usually arises from the small intestine, most commonly the jejunum or ileum. Other less frequent primary anatomic sites include the duodenum, stomach, colon, or outside the gastrointestinal tract. Type II of this lymphoma may occur sporadically outside the context of celiac disease.
- Inclusions:**              Enteropathy type intestinal T-cell lymphoma  
                                         Intestinal T-cell lymphoma
- 2A90.8      Hepatosplenic T-cell lymphoma**
- An extranodal, mature T-cell non-Hodgkin lymphoma that originates from cytotoxic T-cells, usually of gamma/delta T-cell type. It is characterised by the presence of medium-size neoplastic lymphocytes infiltrating the hepatic sinusoids. A similar infiltrating pattern is also present in the spleen and bone marrow that are usually involved at the time of the diagnosis.
- 2A90.9      Angioimmunoblastic T-cell lymphoma**
- A mature T-cell non-Hodgkin lymphoma, characterised by systemic disease and a polymorphous infiltrate involving lymph nodes and extranodal sites. The clinical course is typically aggressive.
- Inclusions:**              ALLD - [angioimmunoblastic lymphadenopathy with  
                                         dysproteinaemia]
- 2A90.A      Anaplastic large cell lymphoma, ALK-positive**
- A T-cell peripheral lymphoma composed of usually large, pleomorphic, CD30 positive T-lymphocytes with abundant cytoplasm characterised by the presence of a translocation involving the ALK gene and expression of ALK fusion protein. Most patients present with peripheral and/or abdominal lymphadenopathy, and often have advanced disease and extranodal involvement.
- Inclusions:**              Anaplastic large cell lymphoma, CD30-positive

- 2A90.B Anaplastic large cell lymphoma, ALK-negative**  
 A T-cell peripheral lymphoma morphologically indistinguishable from anaplastic large cell lymphoma, ALK-positive. It is characterised by the absence of the translocation involving the ALK gene and lacks expression of ALK fusion protein.  
**Exclusions:** Primary cutaneous CD30-positive T-cell lymphoproliferative disorders (2B03)
- 2A90.C Peripheral T-cell lymphoma, not otherwise specified**  
 A heterogeneous category of nodal and extranodal mature T-cell lymphomas, which do not correspond to any of the specifically defined entities of mature T-cell lymphoma in the current classification.  
**Inclusions:** T-zone variant Peripheral T-cell lymphoma  
 Lymphoepithelioid lymphoma  
 Follicular variant Peripheral T-cell lymphoma

## Mature T-cell or NK-cell lymphomas and lymphoproliferative disorders, primary cutaneous specified types (2B00-2B0Z)

Primary cutaneous T-cell lymphomas (CTCL) and NK-cell lymphomas are malignant lymphoproliferative diseases of unknown cause that are thought to originate from T-lymphocytes in the lymphoid tissue of the skin and by definition are confined to the skin at initial diagnosis. Included in the class is also a small number of lymphoma-like primary cutaneous lymphoproliferative disorders which are not considered to be truly malignant.

- Inclusions:** Primary cutaneous peripheral T-cell lymphoma  
**Exclusions:** Skin infiltration by nodal or non-cutaneous extranodal lymphoma (2E08)

### **2B00 Subcutaneous panniculitis-like T-cell lymphoma**

Subcutaneous panniculitis-like T-cell lymphoma is a neoplasm of alpha/beta, usually CD8+ T-cells, mainly confined to the subcutis, presenting clinically as subcutaneous nodules which are usually not ulcerated.

### **2B01 Mycosis fungoides**

A peripheral (mature) T-cell lymphoma presenting in the skin with patches/plaques or less commonly with tumours or erythroderma. It is characterised by epidermal and dermal infiltration of small to medium-sized T-cells with cerebriform nuclei.

### **2B02 Sézary syndrome**

A generalised peripheral (mature) T-cell neoplasm characterised by the presence of erythroderma, lymphadenopathy, and neoplastic, cerebriform T-lymphocytes in the blood. Sézary syndrome is an aggressive disease.

### **2B03 Primary cutaneous CD30-positive T-cell lymphoproliferative disorders**

Primary skin disorders characterised immunohistologically by infiltration by neoplastic CD30+ lymphocytes.

| <b>2B03.0</b> | <b>Primary cutaneous CD30-positive anaplastic large cell lymphoma</b><br>An anaplastic large cell lymphoma that is limited to the skin at the time of diagnosis. Most patients present with solitary or localised skin lesions in a form of nodules or papules, which may be tumours. The t(2;5) translocation that is present in many cases of systemic anaplastic large cell lymphoma is not found in this disease.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>2B03.1</b> | <b>Lymphomatoid papulosis</b><br>Lymphomatoid papulosis is a proliferation of T-cells, often clonal, characterised clinically by the appearance of crops of dome-shaped papules and nodules which tend to ulcerate and then heal with scarring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>2B30</b>   | <b>Hodgkin lymphoma</b><br>Malignant lymphomas, previously known as Hodgkin's disease, characterised by the presence of large tumour cells in an abundant admixture of nonneoplastic cells. There are two distinct subtypes: nodular lymphocyte predominant Hodgkin lymphoma and classical Hodgkin lymphoma. Hodgkin lymphoma involves primarily lymph nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>2B30.0</b> | <b>Nodular lymphocyte predominant Hodgkin lymphoma</b><br>Nodular lymphocyte predominant Hodgkin lymphoma (NLPHL) is characterised by a nodular, or a nodular and diffuse proliferation of scattered large neoplastic cells known as popcorn or lymphocyte predominant cells (LP cells) —formerly called L&H cells for lymphocytic and/or histiocytic Reed-Sternberg cell variants. At present an overlap between NLPHL and T-cell-rich large B-cell lymphoma cannot be excluded.                                                                                                                                                                                                                                                                                                                                               |
| <b>2B30.1</b> | <b>Classical Hodgkin lymphoma</b><br>Classical Hodgkin lymphoma is a B-cell lymphoma characterised histologically by the presence of large mononuclear Hodgkin cells and multinucleated Reed-Sternberg (HRS) cells.<br>A monoclonal B-cell lymphoproliferation in the vast majority of cases. It is characterised by a bimodal age distribution (15-30 years of life and late life) and is often associated with EBV infection. In less than 5% of cases it is a monoclonal proliferation of T-lymphocytes. Morphologically, it is characterised by the presence of Reed-Sternberg cells and mononuclear Hodgkin cells. The Reed-Sternberg and mononuclear Hodgkin cells are CD30 positive in nearly all cases and CD15 positive in the majority of cases.<br><b>Inclusions:</b> Classical Hodgkin lymphoma, type not specified |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>2B32</b>   | <b>Immunodeficiency-associated lymphoproliferative disorders</b><br>Post-transplant lymphoproliferative disorder (PTLD) is a polyclonal (benign) or clonal (malignant) proliferation of lymphoid cells that develops as a consequence of immunosuppression in a recipient of a solid organ or bone marrow allograft. PTLDs comprise a spectrum ranging from early, Epstein-Barr virus (EBV)-driven polyclonal lymphoid proliferations to EBV-positive or EBV-negative lymphomas of predominantly B-cell or less often T-cell type. In other immunodeficiency-associated lymphoproliferative disorders, association with EBV is less pronounced.<br><br><i>Inclusions:</i> PTLD - [Post transplant lymphoproliferative disorder] |
| <b>2B32.0</b> | <b>Post-transplant lymphoproliferative disorder, early lesion</b><br>A lymphoproliferative disorder arising as a result of post-transplant immunosuppression therapy. It is characterised by the lack of tissue destruction and the architectural preservation of the involved tissues. It includes two morphologic variants: plasmacytic hyperplasia and infectious mononucleosis-like lymphoproliferative disorders.                                                                                                                                                                                                                                                                                                          |

| <b>2B3Z</b>         | <b>Neoplasms of haematopoietic or lymphoid tissues, unspecified</b>           |

## Malignant neoplasms, except primary neoplasms of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2E2Z)

**Coding Note:** For use of this category, reference should be made to the mortality coding rules and guidelines in the Reference Guide.

**Exclusions:** Neoplasms of brain or central nervous system (2A00-2A0Z)  
Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

Malignant neoplasms, stated or presumed to be primary, of specified sites, except of lymphoid, haematopoietic, central nervous system or related tissues (2B50-2D3Z)

## Malignant mesenchymal neoplasms (2B50-2B5Z)

A usually aggressive malignant mesenchymal cell tumour most commonly arising from muscle, fat, fibrous tissue, bone, cartilage, and blood vessels. Sarcomas occur in both children and adults. The prognosis depends largely on the degree of differentiation (grade) of the tumour. Representative subtypes are liposarcoma, leiomyosarcoma, osteosarcoma, and chondrosarcoma.

**Exclusions:** Mesenchymal tumours of meninges (2A01.1)  
Tumours of cranial or paraspinal nerves (2A02.1)

### **2B50 Chondrosarcoma, primary site**

**Exclusions:** Osteosarcoma, primary site (2B51)

- 2B50.0 Chondrosarcoma of bone or articular cartilage of limbs**
- 2B50.1 Chondrosarcoma of bone or articular cartilage of pelvis**
- 2B50.2 Chondrosarcoma of bone or articular cartilage of ribs, sternum or clavicle**
- 2B50.Y Chondrosarcoma of bone or articular cartilage of other specified sites**
- 2B50.Z Chondrosarcoma of bone or articular cartilage of unspecified sites**

### **2B51 Osteosarcoma, primary site**

A usually aggressive malignant bone-forming mesenchymal tumour, predominantly affecting adolescents and young adults. It usually involves bones and less frequently extraosseous sites. It often involves the long bones (particularly distal femur, proximal tibia, and proximal humerus). Pain with or without a palpable mass is the most frequent clinical symptom. It may spread to other anatomic sites, particularly the lungs.

- 2B51.0 Osteosarcoma of bone or articular cartilage of jaw**
- 2B51.1 Osteosarcoma of bone or articular cartilage of limbs**
- 2B51.2 Osteosarcoma of bone or articular cartilage of pelvis**
- 2B51.Y Osteosarcoma of bone or articular cartilage of other specified sites**
- 2B51.Z Osteosarcoma of bone or articular cartilage of unspecified sites**

|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>2B52</b>   | <b>Ewing sarcoma, primary site</b><br>A small round cell tumour that lacks morphologic, immunohistochemical, and electron microscopic evidence of neuroectodermal differentiation. It represents one of the two ends of the spectrum called Ewing's sarcoma/peripheral neuroectodermal tumour. It affects mostly males under age 20, and it can occur in soft tissue or bone. Pain and the presence of a mass are the most common clinical symptoms. |
| <b>2B52.0</b> | <b>Ewing sarcoma of bone or articular cartilage of limbs</b>                                                                                                                                                                                                                                                                                                                                                                                         |

| 2B56.1      | <b>Angiosarcoma of skin</b><br>A malignant tumour arising from the endothelial cells of the blood vessels. Microscopically, it is characterised by frequently open vascular anastomosing and branching channels. The malignant cells that line the vascular channels are spindle or epithelioid and often display hyperchromatic nuclei. Angiosarcomas most frequently occur in the skin and breast. Patients with long-standing lymphoedema are at increased risk of developing angiosarcoma. |

|             | A malignant neoplasm characterised by a vascular proliferation which usually contains blunt endothelial cells. Erythrocyte extravasation and hemosiderin deposition are frequently present. The most frequent site of involvement is the skin; however it may also occur internally. It generally develops in people with compromised immune systems including those with acquired immune deficiency syndrome (AIDS).                                                                          |

| <b>2B59</b>   | <b>Liposarcoma, primary site</b><br>Liposarcoma, a type of soft tissue sarcoma, describes a group of lipomatous tumours of varying severity ranging from slow-growing to aggressive and metastatic. Liposarcomas are most often located in the lower extremities or retroperitoneum, but they can also occur in the upper extremities, neck, peritoneal cavity, spermatic cord, breast, vulva and axilla.                                                                                                                                                                                                               |

| <b>2B5A</b>   | <b>Synovial sarcoma, primary site</b><br>A malignant neoplasm characterised by the chromosomal translocation t(X;18)(p11;q11). It can occur at any age, but mainly affects young adults, more commonly males. Although any site can be affected, the vast majority of the cases arise in the deep soft tissues of extremities, especially around the knee. Microscopically, synovial sarcoma is classified as monophasic (with a spindle or epithelial cell component) or biphasic (with both spindle and epithelial cell components). Synovial sarcomas can recur or metastasize to the lungs, bones, and lymph nodes. |

| <b>2B5B</b>   | <b>Gastrointestinal stromal tumour, primary site</b><br>This is the most common mesenchymal tumour that arises in the gastrointestinal tract. It is generally immunohistochemically positive for CD117 (KIT), phenotypically paralleling Cajal-cell differentiation, and most examples contain KIT- or PDGFRA-activating mutations. It is most frequent in the stomach and to a lesser degree in the small intestine. The prognosis depends on the tumour size and the mitotic activity.                                                                                                                                |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>2B5C</b>   | <b>Endometrial stromal sarcoma, primary site</b><br>A malignant, infiltrating mesenchymal tumour arising from the uterine corpus, cervix, vagina, and the ovary. Based on its morphologic characteristics, it is classified as either a low grade or an undifferentiated (high grade) stromal sarcoma. The low grade endometrioid stromal sarcoma is characterised by the presence of oval to spindle-shape cells that resemble the cells of the endometrial stroma, without evidence of significant atypia and pleomorphism. Numerous small vessels are also present. The undifferentiated stromal sarcoma is characterised by an aggressive clinical course, the presence of significant cellular atypia, pleomorphism, and high mitotic activity. |
| <b>2B5D</b>   | <b>Malignant mixed epithelial mesenchymal tumour, primary site</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>2B5D.0</b> | <b>Malignant mixed epithelial mesenchymal tumour of ovary</b><br>Malignant mixed epithelial mesenchymal tumour of the ovary is a rare and very aggressive neoplasm presenting most commonly in postmenopausal women and is composed of adenocarcinomatous and sarcomatous elements and, depending on the types of these elements, can be classified as homologous or heterologous. It often has a poor prognosis.                                                                                                                                                                                                                                                                                                                                    |
| <b>2B5D.1</b> | <b>Malignant mixed epithelial and mesenchymal tumour of corpus uteri</b><br>A primary malignant neoplasm of the uterine corpus characterised by the presence of an epithelial and a mesenchymal component. This category includes carcinosarcoma, carcinofibroma, and adenosarcoma.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Y)

Squamous cell carcinomas amount to more than 90% of malignant tumours of the oral cavity and oropharynx. As in other parts of the upper aerodigestive tract, there is a strong and synergistic association with tobacco smoking and alcohol abuse. In some regions, particularly the Indian subcontinent, oral cancer is among the most frequent malignancies, largely due to tobacco chewing.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

|               | Salivary gland tumours can show a striking range of morphological diversity between different tumour types and sometimes within an individual tumour mass. In addition, hybrid tumours, dedifferentiation and the propensity for some benign tumours to progress to malignancy can confound histopathological interpretation. These features, together with the relative rarity of a number of tumours, can sometimes make diagnosis difficult, despite the abundance of named tumour entities. The increasing use of pre-operative fine needle aspiration biopsies also needs to be taken into account, as artifactual changes may be superimposed on the tumours. Unfortunately, the morphological variability of these tumours is mirrored by the immunocytochemical profiles, so that special stains are rarely useful in routine diagnosis of salivary gland epithelial neoplasms. |

| <b>2B68</b>   | <b>Malignant neoplasms of submandibular or sublingual glands</b><br>Salivary gland tumours can show a striking range of morphological diversity between different tumour types and sometimes within an individual tumour mass. In addition, hybrid tumours, dedifferentiation and the propensity for some benign tumours to progress to malignancy can confound histopathological interpretation. These features, together with the relative rarity of a number of tumours, can sometimes make diagnosis difficult, despite the abundance of named tumour entities. The increasing use of pre-operative fine needle aspiration biopsies also needs to be taken into account, as artifactual changes may be superimposed on the tumours. Unfortunately, the morphological variability of these tumours is mirrored by the immunocytochemical profiles, so that special stains are rarely useful in routine diagnosis of salivary gland epithelial neoplasms.<br><i><b>Exclusions:</b></i> Malignant neoplasms of parotid gland (2B67)<br>Malignant mesenchymal neoplasms (2B50-2B5Z) |

| <b>2B6A.0</b>  | <b>Squamous cell carcinoma of oropharynx</b>                            | A squamous cell carcinoma arising from the oropharynx. It predominantly affects adults in their fifth and sixth decades of life and is associated with alcohol and tobacco use. Human papillomavirus is present in approximately half of the cases. It is characterised by a tendency to metastasize early to the lymph nodes. When the tumour is small, patients are often asymptomatic. Physical examination may reveal erythematous or white lesions or plaques. The majority of patients present with locally advanced disease. Signs and symptoms include mucosal ulceration, pain, bleeding, weight loss, neck swelling, and difficulty speaking, chewing, and swallowing. Patients may also present with swollen neck lymph nodes without any symptoms from the oropharyngeal tumour. The most significant prognostic factors are the size of the tumour and the lymph nodes status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>2B6B</b>    | <b>Malignant neoplasms of nasopharynx</b>                               | A wide variety of tumours can arise in the nasopharynx, but it is nasopharyngeal carcinoma that has fascinated generations of oncologists, pathologists, scientists and epidemiologists. It shows marked geographic differences, with highest incidence rates in Southern China. In some endemic areas, the incidence has declined by about 30% over the past two decades, suggesting that environmental or lifestyle factors may play a major role and that the disease is, to some extent, preventable. Nasopharyngeal carcinoma shows a very strong association with Epstein-Barr virus (EBV) infection, irrespective of the ethnic origin of the patients. This association has pioneered a new paradigm of utilizing viral serological tests for the diagnosis of cancer and for screening in high-risk populations. Nasopharyngeal carcinoma is generally responsive to radiation therapy, and the clinical outcome has greatly improved over the years, due to refinements in staging and to improved therapy protocols. The unusual and often deceptive histological features of nasopharyngeal carcinoma have generated controversies over the nature of the tumour and still pose a challenge to surgical pathologists. There have possibly been more names invented for the various histological subtypes of nasopharyngeal carcinoma than any other tumour type. |

## Malignant neoplasms of digestive organs (2B70-2C1Z)

A primary malignant neoplasm involving any part of the gastrointestinal system.

**Exclusions:** Malignant neoplasm metastasis in digestive system (2D80-2D8Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

Malignant neoplasms of lip, oral cavity or pharynx (2B60-2B6Y)

### 2B70

#### Malignant neoplasms of oesophagus

A primary malignant neoplasm involving the oesophagus

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

#### 2B70.0 Adenocarcinoma of oesophagus

A malignant tumour with glandular differentiation arising predominantly from Barrett mucosa in the lower third of the esophagus. Grossly, esophageal adenocarcinomas are similar to esophageal squamous cell carcinomas. Microscopically, adenocarcinomas arising in the setting of Barrett esophagus are typically papillary and/or tubular. The prognosis is poor.

#### 2B70.00 Barrett adenocarcinoma

Barrett adenocarcinoma is defined as adenocarcinoma of lower oesophagus and gastroesophageal junction associated with Barrett's oesophagus.

#### 2B70.0Y Other specified adenocarcinoma of oesophagus

#### 2B70.0Z Adenocarcinoma of oesophagus, unspecified

#### 2B70.1 Squamous cell carcinoma of oesophagus

A squamous cell carcinoma arising from the esophagus. It can be associated with a long history of tobacco and alcohol abuse and is exceedingly rare before the age of 30. The median age is around 65 in both males and females, but the incidence in males is much higher than in females. It is located mostly in the middle and lower third of the esophagus. Grossly, polypoid, ulcerated, plaque-like and occult lesions have been described. The microscopic features are the same as in other squamous cell carcinomas. Any degree of differentiation may occur, and variation within a single tumour is common. The prognosis is poor.

#### 2B70.Y Other specified malignant neoplasms of oesophagus

#### 2B70.Z Malignant neoplasms of oesophagus, unspecified

### 2B71

#### Malignant neoplasms of oesophagogastric junction

Malignant neoplasms that arise from the cells of the oesophagogastric junction (OGJ), which is defined as the point at which the oesophagus ends and the stomach begins. This mainly defines adenocarcinomas that straddle the junction of the oesophagus and stomach. This definition includes many tumours formally called cancers of the gastric cardia.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

| <b>2B71.0</b> | <b>Adenocarcinoma of oesophagogastric junction</b><br>An adenocarcinoma that arises from and straddles the junction of the stomach and esophagus. The category of adenocarcinomas of the gastroesophageal junction also includes the majority of adenocarcinomas previously called gastric cardia adenocarcinomas. Squamous cell carcinomas that affect or cross the junction of the stomach and esophagus are classified as carcinomas of the distal esophagus. Adenocarcinoma of the gastroesophageal junction occurs more often in Caucasian middle aged and elderly males. Clinical signs and symptoms include dysphagia, abdominal pain, and weight loss. The prognosis depends on the completeness of the surgical resection, the number of lymph nodes involved by cancer, and the presence or absence of postoperative complications. |
| <b>2B71.Y</b> | <b>Other specified malignant neoplasm of oesophagogastric junction</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>2B72.0</b> | <b>Adenocarcinoma of stomach</b><br>An adenocarcinoma arising from the stomach glandular epithelium. Gastric adenocarcinoma is primarily a disease of older individuals. It most commonly develops after a long period of atrophic gastritis and is strongly associated with <i>Helicobacter pylori</i> infection. The lack of early symptoms often delays the diagnosis of gastric cancer. The majority of patients present with advanced tumours which have poor rates of curability. Microscopically, two important histologic types of gastric adenocarcinoma are recognised: the intestinal and diffuse type. The overall prognosis of gastric adenocarcinomas is poor, even in patients who receive a curative resection.                                                                                                               |

## Malignant neoplasms of intestine (2B80-2C0Z)

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

### 2B80

#### **Malignant neoplasms of small intestine**

A primary malignant neoplasm involving the small intestine.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**Coded Elsewhere:** Enteropathy associated T-cell lymphoma (2A90.7)  
Gastrointestinal stromal tumour of small intestine (2B5B.1)  
Malignant lymphoma of small intestine (2B33.5)  
Malignant neoplasm of jejunum (2B80.1Z)  
Malignant neoplasm of ileum (2B80.1Z)  
Small intestinal leiomyosarcoma (2B58.Y)

#### **2B80.0 Malignant neoplasms of duodenum**

A primary malignant neoplasm that affects the duodenum. Representative examples include carcinoma, lymphoma, and sarcoma.

**Coded Elsewhere:** Lymphoma of duodenum (2B33.5)  
Malignant mesenchymal tumour of the duodenum (2B5F.2)

#### **2B80.00 Adenocarcinoma of duodenum**

An adenocarcinoma that arises from the duodenum.

#### **2B80.01 Neuroendocrine neoplasm of duodenum**

Neoplasms that arise from the cells of neuroendocrine system lining the duodenum.

#### **2B80.0Y Other specified malignant neoplasms of the duodenum**

#### **2B80.0Z Malignant neoplasms of duodenum, unspecified**

#### **2B80.1 Malignant neoplasms of jejunum or ileum**

#### **2B80.10 Adenocarcinoma of jejunum or ileum**

#### **2B80.11 Neuroendocrine neoplasms of jejunum or ileum**

Neoplasms that arise from the cells of neuroendocrine system lining the jejunum or ileum including well-differentiated (low- to intermediated grade) neuroendocrine tumours. These include carcinoid tumour.

#### **2B80.1Y Other specified malignant neoplasms of jejunum or ileum**

#### **2B80.1Z Malignant neoplasms of jejunum or ileum, unspecified**

#### **2B80.2 Malignant neoplasms of small intestine, site unspecified**

#### **2B80.20 Adenocarcinoma of small intestine, site unspecified**

A malignant tumour with glandular differentiation arising from epithelium of small intestine.

**Exclusions:** Neuroendocrine neoplasms of small intestine, site unspecified (2B80.21)

| <b>2C00.3</b> | <b>Squamous cell carcinoma of anus or anal canal</b><br>A squamous cell carcinoma (SCC) arising from the anal canal up to the junction with the anal margin (perianal, hair-bearing skin). Human papillomavirus is detected in the majority of cases. Homosexual HIV-positive men have an increased risk of developing anal squamous cell carcinoma in comparison to the general male population. The prognosis is generally better for anal margin SCC than for anal canal SCC. The former are classified with skin tumours. |

**2C12****Malignant neoplasms of liver or intrahepatic bile ducts**

The most frequent and important hepatic neoplasm is the primary hepatocellular carcinoma (HCC). In many parts of the world, in particular Africa and Asia, it poses a significant disease burden. In these high incidence regions, chronic infection with hepatitis B virus (HBV) is the principal underlying cause, with the exception of Japan which has a high prevalence of hepatitis C infection. HBV vaccination has become a powerful tool in reducing cirrhosis and HCC, but implementation is still suboptimal in several high risk regions. In Western countries, chronic alcohol abuse is a major aetiological factor. Hepatic cholangiocarcinoma has a different geographical distribution, with peak incidences in Northern Thailand. Here, it is caused by chronic infection with the liver fluke, *Opisthorchis viverrini*, which is ingested through infected raw fish.

**Exclusions:** Secondary malignant neoplasm of liver (2D80)  
Malignant neoplasm of biliary tract NOS (2C17)

**2C12.0 Malignant neoplasm of liver****2C12.00** Combined hepatocellular-cholangiocarcinoma

Combined hepatocellular-cholangiocarcinoma is a tumour containing unequivocal, intimately mixed elements of both hepatocellular carcinoma and cholangiocarcinoma.

**Inclusions:** Hepatocholangiocarcinoma

**2C12.01** Hepatoblastoma

A malignant liver neoplasm that occurs almost exclusively in infants, although isolated cases in older children and adults have been reported. Grossly, hepatoblastoma is solid, well circumscribed, and more often solitary than multiple. Microscopically, most of the tumours are composed exclusively of immature hepatocytic elements. About a fourth of hepatoblastomas contain a stromal component that may be undifferentiated or develop into bone or cartilage.

**2C12.02** Hepatocellular carcinoma of liver

A carcinoma that arises from the hepatocytes.

**2C12.03** Mesothelial carcinoma of liver**2C12.0Y** Other specified malignant neoplasm of liver**2C12.0Z** Malignant neoplasm of liver, unspecified**2C12.1 Malignant neoplasm of intrahepatic bile ducts****2C12.10** Intrahepatic cholangiocarcinoma

A carcinoma that arises from the intrahepatic bile duct epithelium in any site of the intrahepatic biliary tree. Grossly, the malignant lesions are solid, nodular, and grayish. Morphologically, the vast majority of cases are adenocarcinomas. Early detection is difficult and the prognosis is generally poor.

| <b>2C13</b>   | <b>Malignant neoplasms of gallbladder</b>                                              | A malignant tumour arising from the epithelium of the gallbladder. It is usually associated with the presence of gallstones. Clinical symptoms are not specific and usually present late in the course. Morphologically, adenocarcinoma is the most common type, however squamous cell carcinomas, adenosquamous carcinomas, signet ring carcinomas, and undifferentiated carcinomas can also occur.                                                                                                                                                                                                                           |
| <b>2C13.0</b> | <b>Adenocarcinoma of the gallbladder</b>                                               | An adenocarcinoma arising from the gallbladder. It is the most common malignant tumour of the gallbladder, typically in the fundus; it is usually well to moderately differentiated. The incidence is higher in patients with gallstones than in patients without gallstones. Signs and symptoms usually present late in the course of the disease and are reminiscent of those of chronic cholecystitis including right upper quadrant pain. Histologic variants include adenocarcinoma of the intestinal type, clear cell adenocarcinoma, mucinous adenocarcinoma, papillary adenocarcinoma, and signet ring adenocarcinoma. |

## Malignant neoplasms of middle ear, respiratory or intrathoracic organs (2C20-2C2Z)

**Exclusions:** Mesotheliomas of peritoneum (2C51.2)  
Malignant mesenchymal neoplasms (2B50-2B5Z)

### 2C20

#### Malignant neoplasms of nasal cavity

From the chapter on Nasal Cavity (H&N BB) Although the nasal cavity and paranasal sinuses occupy a relatively small anatomical space, they are the site of origin of some of the more complex, histologically diverse group of tumours in the entire human body. These include neoplasms derived from mucosal epithelium, seromucinous glands, soft tissues, bone, cartilage, neural/neuroectodermal tissue, haematolymphoid cells and the odontogenic apparatus. Many of the tumours are similar to those found elsewhere in the body but a few, such as the olfactory neuroblastoma, are unique to this site.

**Exclusions:** Malignant neoplasm of nose NOS (2C29)  
Malignant neoplasm of olfactory bulb (2A02)  
Malignant neoplasm of posterior margin of nasal septum and choana (2B6B)  
Malignant neoplasm of skin of nose (2C30-2C3Z)  
Malignant mesenchymal neoplasms (2B50-2B5Z)

- 2C20.0 Adenocarcinoma of nasal cavity
- 2C20.1 Malignant neuroepitheliomatous neoplasm of nasal cavity
- 2C20.2 Melanoma of nasal cavity
- 2C20.3 Olfactory neuroblastoma
- 2C20.4 Squamous cell carcinoma of nasal cavity
- 2C20.Y Other specified malignant neoplasm of nasal cavity
- 2C20.Z Malignant neoplasms of nasal cavity, unspecified

### 2C21

#### Malignant neoplasms of middle ear

Malignant neoplasm originating in the middle ear.

**Exclusions:** malignant neoplasm of skin of (external) ear (2C30-2C3Z)  
malignant neoplasm of bone of ear (meatus) (2B50-2B5Z)  
malignant neoplasm of cartilage of ear (2B50-2B5Z)  
Malignant mesenchymal neoplasms (2B50-2B5Z)

- 2C21.0 Adenocarcinoma of middle ear
- 2C21.1 Squamous cell carcinoma of middle ear
- 2C21.2 Unspecified malignant epithelial neoplasm of middle ear
- 2C21.Y Other specified malignant neoplasm of middle ear

| <b>2C25.0</b>  | <b>Adenocarcinoma of bronchus or lung</b><br>A carcinoma that arises from the lung and is characterised by the presence of malignant glandular epithelial cells. There is a male predilection with a male to female ratio of 2:1. Usually lung adenocarcinoma is asymptomatic and is identified through screening studies or as an incidental radiologic finding. If clinical symptoms are present they include shortness of breath, cough, hemoptysis, chest pain, and fever. Tobacco smoke is a known risk factor. |
| <b>2C25.1</b>  | <b>Small cell carcinoma of bronchus or lung</b><br>A highly aggressive subtype of lung carcinoma characterised by the presence of malignant small cells and necrosis. Metastatic disease is usually present at the time of diagnosis.                                                                                                                                                                                                                                                                                |
| <b>2C25.2</b>  | <b>Squamous cell carcinoma of bronchus or lung</b><br>A carcinoma arising from malignant squamous bronchial epithelial cells and characterised by the presence of keratinization and/or intercellular bridges. Cigarette smoking and arsenic exposure are strongly associated with squamous cell lung carcinoma.                                                                                                                                                                                                     |

## Malignant neoplasms of skin (2C30-2C3Z)

A primary or metastatic tumour involving the skin. Primary malignant skin tumours most often are carcinomas (either basal cell or squamous cell carcinomas that arise from cells in the epidermis) or melanomas that arise from pigment-containing skin melanocytes. Metastatic tumours to the skin include carcinomas and lymphomas.

*Exclusions:*

- Carcinoma in situ of skin (2E64)
- Metastatic malignant neoplasm involving skin (2E08)
- Malignant mesenchymal neoplasms (2B50-2B5Z)

|             |                                                                                                                                                                                                                                                                                                                                    |

| <b>2C30</b> | <b>Melanoma of skin</b>                                                                                                                                                                                                                                                                                                            |
|             | A primary melanoma arising from atypical melanocytes in the skin. Precursor lesions include acquired and congenital melanocytic nevi, and dysplastic nevi. Several histologic variants have been recognised, including superficial spreading melanoma, acral lentiginous melanoma, nodular melanoma, and lentigo maligna melanoma. |
|             | <i>Exclusions:</i>                                                                                                                                                                                                                                                                                                                 |
|             | Melanoma of penis (2C81.1)                                                                                                                                                                                                                                                                                                         |
|             | Melanoma of vulva (2C70.1)                                                                                                                                                                                                                                                                                                         |

- 2C30.0 Superficial spreading melanoma, primary**  
The commonest form of melanoma, superficial spreading malignant melanoma accounts for about 70 per cent of all melanomas. It characteristically presents as an asymptomatic pigmented cutaneous macule which is asymmetrical in shape and displays variability in both hue and pigment intensity. It has a relatively long phase of progressive superficial extension (radial growth) before penetrating deeper into the dermis and entering an invasive vertical growth phase.
- 2C30.1 Nodular melanoma, primary**  
Variant of melanoma carrying a poor prognosis due to the fact that there is little or no prodromal radial (superficial) growth phase before deep invasion (vertical growth). The lesion presents as an elevated, reddish, bluish or dark brown coloured, dome-shaped tumour. Ulceration or bleeding from the lesion occurs frequently. It occurs most frequently in the fifth or sixth decade.
- 2C30.2 Lentigo maligna melanoma, primary**  
Lentigo maligna malignant melanoma is a form of melanoma which occurs within a lentigo maligna when neoplastic cells no longer remain confined to the epidermis (in situ radial growth) but invade the dermis (vertical growth). The lentigo maligna from which it arises may have been present as an irregularly pigmented macule on sun-exposed skin for many years before dermal invasion supervenes. Clinical differentiation from lentigo maligna may not be possible in the early stages of invasion but as the tumour progresses a focal thickening or nodule within the lentigo maligna will become apparent.  
**Exclusions:** Lentigo maligna (2E63.00)
- 2C30.3 Acral lentiginous melanoma, primary**  
Acral lentiginous malignant melanoma is a distinct and uncommon form of melanoma affecting either palmar and plantar skin or the nail apparatus. It is usually preceded by a slowly progressive in situ phase which may be overlooked. It typically presents either as an enlarging area of macular pigmentation on the palms and soles or as a longitudinal pigmented band within the nail plate. More aggressive tumours present as ulcerated nodules which, when involving the nail apparatus, can destroy the nail plate. Acral lentiginous malignant melanoma accounts for a high proportion of melanomas seen in dark-skinned people.
- 2C30.Y Other specified melanoma of skin**
- 2C30.Z Melanoma of skin, unspecified**
- 2C31 Squamous cell carcinoma of skin**  
A carcinoma arising from the squamous cells of the epidermis. Skin squamous cell carcinoma is most commonly found on sun-exposed areas. The majority of the tumours are well-differentiated.  
**Coded Elsewhere:** Squamous cell carcinoma of penis (2C81.0)

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>2C31.0</b> | <b>Verrucous squamous cell carcinoma of skin</b><br>Verrucous squamous cell carcinoma is a rare variant of well-differentiated squamous cell carcinoma with low malignant potential. It occurs principally on the glans and prepuce of the penis and on the sole of the foot.<br><b>Exclusions:</b> Verrucous squamous cell carcinoma of vulva (2C70.2)                                                                                                                                                                                                                                                                                                                                                   |
| <b>2C31.1</b> | <b>Keratoacanthoma</b><br>Keratoacanthoma is a relatively common keratinocytic epidermal tumour which shows resemblances to squamous cell carcinoma of the skin, from which it may be difficult to distinguish either clinically or histopathologically. It is characterised by rapid growth over a few weeks to months, followed by spontaneous resolution over 4-6 months. Because it is not possible to predict its benign behaviour with complete certainty during its initial growth phase, the designation "Well-differentiated squamous cell carcinoma (keratoacanthoma type)" is also used.                                                                                                       |
| <b>2C31.Z</b> | <b>Cutaneous squamous cell carcinoma</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>2C32</b>   | <b>Basal cell carcinoma of skin</b><br>Basal cell carcinoma or BCC is the most common malignancy in humans. It is believed that BCCs arise from pluripotential cells in the basal layer of the epidermis or, less commonly, hair follicle. BCCs typically occur in areas of chronic sun exposure and present as slowly enlarging reddish papules, plaques or nodules on the head and neck, although the superficial variant is often located on the trunk. BCCs frequently ulcerate and become crusted. Although they rarely metastasize, they can cause significant local destruction and disfigurement if neglected or inadequately treated, particularly if of the sclerosing or infiltrative subtype. |
| <b>2C32.0</b> | <b>Nodular basal cell carcinoma of skin</b><br>This is the most common form of basal cell carcinoma and is typically located on the head or neck. It starts as a small translucent nodule which will frequently necrose and ulcerate as it enlarges. Telangiectatic blood vessels can often be detected just under the tumour surface. A minority may be pigmented and give rise to difficulty in distinguishing them from melanoma.                                                                                                                                                                                                                                                                      |
| <b>2C32.1</b> | <b>Sclerosing basal cell carcinoma of skin</b><br>This form of basal cell carcinoma is composed of thin strands, cords and columns of malignant cells which infiltrate between collagen bundles of the dermis. It may infiltrate widely and deeply before it becomes clinically obvious. It typically starts as a pale, poorly-defined indurated plaque which may not come to medical attention until it starts to bleed and crust.                                                                                                                                                                                                                                                                       |
| <b>2C32.2</b> | <b>Superficial basal cell carcinoma of skin</b><br>Superficial basal cell carcinomas are often multiple and appear as pink or red barely elevated patches varying in size from a few mm to over 10 cm in diameter. A fine pearly border can usually be seen on careful inspection. They occur most frequently on the trunk.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>2C32.Y</b> | <b>Other specified basal cell carcinoma of skin</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>2C32.Z</b> | <b>Basal cell carcinoma of skin, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**2C33****Adnexal carcinoma of skin**

A carcinoma arising from the sebaceous glands, sweat glands, or the hair follicles. Representative examples include sebaceous carcinoma, apocrine carcinoma, eccrine carcinoma, and pilomatrical carcinoma.

**Inclusions:**

- Primary cutaneous mucinous carcinoma
- Primary cutaneous adenoid cystic carcinoma
- Appendageal carcinoma of skin

**2C34****Cutaneous neuroendocrine carcinoma**

Cutaneous neuroendocrine carcinoma is a primary cutaneous cancer arising from a subset of skin neuroendocrine cells (Merkel cells, giving the name Merkel cell carcinoma (MCC)).

**2C35****Cutaneous sarcoma**

A group of generally rare malignant neoplasms arising from mesenchymal elements in the dermis including fibroblasts, pilar smooth muscle and vascular endothelium.

**Coded Elsewhere:**

- Angiosarcoma of skin (2B56.1)
- Kaposi sarcoma of skin (2B57.1)
- Cutaneous leiomyosarcoma (2B58.Y)
- Dermatofibrosarcoma protuberans (2B53.Y)

## Malignant neoplasms of retroperitoneum, peritoneum or omentum (2C50-2C5Z)

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

### 2C50

#### Malignant neoplasms of retroperitoneum

A primary or metastatic malignant neoplasm involving the retroperitoneum. The vast majority of cases are carcinomas, lymphomas, or sarcomas.

**Exclusions:** Malignant neoplasms of omentum (2C52)  
Malignant neoplasms of peritoneum (2C51)  
Malignant mesenchymal neoplasms (2B50-2B5Z)

2C50.0 Cystic, mucinous or serous carcinoma of retroperitoneum

2C50.Y Other specified malignant neoplasms of retroperitoneum

2C50.Z Malignant neoplasms of retroperitoneum, unspecified

### 2C51

#### Malignant neoplasms of peritoneum

**Exclusions:** Malignant neoplasms of retroperitoneum (2C50)  
Malignant neoplasms of omentum (2C52)  
Malignant mesenchymal neoplasms (2B50-2B5Z)

2C51.0 Adenocarcinomas of peritoneum

2C51.1 Cystic, mucinous or serous carcinoma of peritoneum

2C51.2 Mesotheliomas of peritoneum

A benign or malignant mesothelial neoplasm that arises from the peritoneum.

2C51.20 Mesothelioma of mesocolon

2C51.21 Mesothelioma of mesentery

2C51.2Y Mesotheliomas of other specified sites of peritoneum

2C51.2Z Mesotheliomas of peritoneum, site unspecified

2C51.Y Other specified malignant neoplasms of peritoneum

2C51.Z Malignant neoplasms of peritoneum, unspecified

### 2C52

#### Malignant neoplasms of omentum

**Exclusions:** Malignant neoplasms of retroperitoneum (2C50)  
Malignant neoplasms of peritoneum (2C51)  
Malignant mesenchymal neoplasms (2B50-2B5Z)

**Coded Elsewhere:** Myosarcomas of omentum (2B5F.10)

2C52.0 Cystic, mucinous or serous carcinoma of omentum

2C52.Y Other specified malignant neoplasms of omentum

## Malignant neoplasms of breast (2C60-2C6Z)

The category refers to primary malignant neoplasms of parenchyma, connective, and soft tissue of the breast, including nipple and areola.

*Inclusions:* malignant neoplasm of connective tissue of breast

*Exclusions:* Malignant neoplasm of skin of breast (2C30-2C3Z)

Malignant mesenchymal neoplasms (2B50-2B5Z)

| <b>2C61.4</b> | <b>Invasive carcinoma of breast, unidentifiable type</b><br>A carcinoma that infiltrates the breast parenchyma and where the histopathological type could not be identified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>2C62</b>   | <b>Inflammatory carcinoma of breast</b><br>An advanced, invasive breast adenocarcinoma characterised by the presence of distinct changes in the overlying skin. These changes include diffuse erythema, edema, peau d'orange (skin of an orange) appearance, tenderness, induration, warmth, enlargement, and in some cases a palpable mass. The skin changes are the consequence of lymphatic obstruction from the underlying invasive breast adenocarcinoma. Microscopically, the dermal lymphatics show prominent infiltration by malignant cells. The invasive breast adenocarcinoma is usually of ductal, NOS type. There is not significant inflammatory cell infiltrate present, despite the name of this carcinoma. |
| <b>2C63</b>   | <b>Malignant phyllodes tumour of breast</b><br>A phyllodes tumour of the breast characterised by infiltrative margins and a sarcomatous stromal component. The sarcomatous stroma usually displays features of fibrosarcoma. Liposarcomatous, osteosarcomatous, or rhabdomyosarcomatous elements may also be present.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>2C64</b>   | <b>Solid papillary carcinoma of breast with evidence of invasion</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Malignant neoplasms of female genital organs (2C70-2C7Z)

A primary or metastatic malignant neoplasm involving the female reproductive system. Representative examples include endometrial carcinoma, cervical carcinoma, ovarian carcinoma, uterine corpus leiomyosarcoma, adenosarcoma, malignant mixed mesodermal (mullerian) tumour, and gestational choriocarcinoma.

**Coding Note:** Includes Malignant neoplasm of skin of female genital organs

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

### 2C70

#### Malignant neoplasms of vulva

Squamous cell carcinoma of the vulva occurs predominantly in the older age group. Although the incidence rate of vulvar intraepithelial neoplasia is increasing, that of squamous cell carcinoma of the vulva is declining, reflecting earlier detection and more successful treatment. In addition to human papillomavirus infection, cigarette smoking is a putative risk factor for vulvar squamous cell carcinoma. There are three known precursor lesions: vulvar intraepithelial neoplasia, lichen sclerosus and chronic granulomatous disease. Other important epithelial malignancies of the vulva are Paget disease and Bartholin gland carcinoma. They are much less

common than squamous lesions, and the risk factors are largely unknown. Prominent non-epithelial tumours are malignant melanoma and sarcoma botryoides.

**Coding Note:** Includes skin of vulva.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

#### 2C70.0

##### Basal cell carcinoma of vulva

A slow growing, locally infiltrating carcinoma that arises from the vulva. It is characterised by the presence of malignant cells that resemble the basal cells that are present in the epidermis.

#### 2C70.1

##### Melanoma of vulva

#### 2C70.2

##### Squamous cell carcinoma of vulva

An invasive squamous cell carcinoma arising from the vulva. Risk factors include the human papilloma virus and cigarette smoking. Precursor lesions include the vulvar intraepithelial neoplasia, lichen sclerosus with associated squamous cell hyperplasia, and chronic granulomatous vulvar disease such as granuloma inguinale. Symptoms include vulvar pruritus or irritation, discharge, bleeding, and pain. The following morphologic variants have been identified: keratinizing, non-keratinizing, basaloid, warty, verrucous, keratoacanthoma-like, and squamous cell carcinoma with tumour giant cells. Risk factors for recurrence include advanced stage, tumour diameter greater than 2.5 cm, multifocality, capillary-like space involvement, associated vulvar intraepithelial neoplasia grades 2 or 3, and margins of resection involved by tumour.

**Coded Elsewhere:** Verrucous squamous cell carcinoma of vulva (2C31.0)

#### 2C70.Y

##### Other specified malignant neoplasms of vulva

**Coding Note:** Includes skin of vulva.

#### 2C70.Z

##### Malignant neoplasms of vulva, unspecified

**Coding Note:** Includes skin of vulva.

**2C71****Malignant neoplasms of vagina**

A primary or metastatic malignant tumour involving the vagina. Representative examples include carcinomas and sarcomas.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C71.0****Adenocarcinoma of vagina**

An adenocarcinoma arising from the vagina. Morphologic variants include the clear cell, endometrioid, mesonephric, and mucinous adenocarcinoma.

**2C71.1****Melanoma of vagina**

A primary malignant neoplasm of the vagina composed of malignant melanocytes.

**2C71.2****Squamous cell carcinoma of vagina**

A squamous cell carcinoma arising from the vagina. Human papillomavirus infection is associated with the development of vaginal intraepithelial neoplasia and invasive squamous cell carcinoma. Signs and symptoms include painless bleeding, postcoital bleeding, and urinary tract symptoms. Morphologically it resembles squamous cell carcinomas in other anatomic sites.

**2C71.Y****Other specified malignant neoplasms of vagina****2C71.Z****Malignant neoplasms of vagina, unspecified****2C72****Malignant neoplasms of uterine ligament, parametrium, or uterine adnexa**

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2C72.0****Adenocarcinoma of uterine ligament, parametrium, or uterine adnexa****2C72.1****Mucinous or serous carcinoma of uterine ligament, parametrium, or uterine adnexa****2C72.3****Carcinosarcomas of uterine ligament, parametrium, or uterine adnexa****2C72.Y****Other specified malignant neoplasms of uterine ligament, parametrium, or uterine adnexa****2C72.Z****Malignant neoplasms of uterine ligament, parametrium, or uterine adnexa, unspecified****2C73****Malignant neoplasms of ovary**

A primary or metastatic malignant neoplasm involving the ovary. Most primary malignant ovarian neoplasms are either carcinomas (serous, mucinous, or endometrioid adenocarcinomas) or malignant germ cell tumours. Metastatic malignant neoplasms to the ovary include carcinomas, lymphomas, and melanomas.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**Coded Elsewhere:** Hereditary breast and ovarian cancer syndrome (2C65)

**2C73.0****Carcinomas of ovary**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>2C73.00</b> | <p>Clear cell adenocarcinoma of ovary</p> <p>A malignant glandular epithelial tumour characterised by the presence of clear and hobnail cells. The tumour is highly associated with ovarian endometriosis, pelvic endometriosis and paraendocrine hypercalcemia.</p>                                                                                                                                                                                                                                           |
| <b>2C73.01</b> | <p>Endometrioid adenocarcinoma of ovary</p> <p>An endometrioid adenocarcinoma arising from the ovary. It comprises 10% to 25% of all primary ovarian carcinomas. Grossly, endometrioid carcinoma may present as a cystic or solid mass. Microscopically, the tumour greatly resembles the appearance of the ordinary type of endometrial adenocarcinoma. As a group, endometrioid carcinoma has a prognosis twice as good as that of serous or mucinous carcinoma.</p>                                         |
| <b>2C73.02</b> | <p>Low grade serous adenocarcinoma of ovary</p> <p>A slow-growing serous adenocarcinoma that arises from the ovary. It usually originates from borderline neoplastic processes or adenofibromas. It is characterised by the presence of low grade cytologic features and infrequent mitotic figures.</p>                                                                                                                                                                                                       |
| <b>2C73.03</b> | <p>High grade serous adenocarcinoma of ovary</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>2C73.04</b> | <p>Mucinous adenocarcinoma of ovary</p> <p>An invasive adenocarcinoma that arises from the ovary and is characterised by the presence of malignant epithelial cells that contain intracytoplasmic mucin. There is cellular atypia, increased layering of cells, complexity of glands, and papillary formations.</p>                                                                                                                                                                                            |

|               | A malignant germ cell tumour arising from the ovary. It usually affects females in their first two decades of life. It contains variable amounts of immature embryonal tissues. Based on the amount of immature neuroepithelial component, immature teratomas are graded from 1 to 3. The stage and grade of the tumour and the grade of the metastatic tumour are the important factors that predict prognosis. The use of cisplatin-based combination chemotherapy has significantly improved the survival rates of the patients.                                                                                                                          |

|               | Tumours of the fallopian tube are much less common than the corresponding ovarian neoplasms; however, histologically the same surface epithelial-stromal tumour subtypes are recognised. Sex cord-stromal and germ cell tumours are rare. Hydatidiform moles and gestational choriocarcinoma are uncommon complications of tubal ectopic pregnancy. The wolffian adnexal tumour is also infrequent and typically occurs in the leaves of the broad ligament. The risk factors appear similar to those of the ovary. Fallopian tube carcinomas are a component of the hereditary breast-ovarian cancer syndrome caused by BRCA1 and BRCA2 germline mutations. |

- 2C76.Z**      **Malignant neoplasms of corpus uteri, unspecified**

**2C77****Malignant neoplasms of cervix uteri**

Primary or metastatic malignant neoplasm involving the cervix.

- 2C77.0**      **Squamous cell carcinoma of cervix uteri**  
A squamous cell carcinoma arising from the cervical epithelium. It usually evolves from a precancerous cervical lesion. Increased numbers of sexual partners and human papillomavirus (HPV) infection are risk factors for cervical squamous cell carcinoma. The following histologic patterns have been described: Conventional squamous cell carcinoma, papillary squamous cell carcinoma, transitional cell carcinoma, lymphoepithelioma-like carcinoma, verrucous carcinoma, condylomatous carcinoma and spindle cell carcinoma. Survival is most closely related to the stage of disease at the time of diagnosis.
- 2C77.1**      **Adenocarcinoma of cervix uteri**  
An adenocarcinoma arising from the cervical epithelium. It accounts for approximately 15% of invasive cervical carcinomas. Increased numbers of sexual partners and human papillomavirus (HPV) infection are risk factors. Grossly, advanced cervical adenocarcinoma may present as an exophytic mass, an ulcerated lesion, or diffuse cervical enlargement. Microscopically, the majority of cervical adenocarcinomas are of the endocervical (mucinous) type.
- 2C77.2**      **Adenosquamous carcinoma of cervix uteri**
- 2C77.3**      **Neuroendocrine carcinoma of cervix uteri**

| <b>2C81.0</b> | <b>Squamous cell carcinoma of penis</b><br>A squamous cell carcinoma arising from the penis. It occurs chiefly in the squamous epithelium of the glans, coronal sulcus, and foreskin. Etiologic factors include phimosis, lichen sclerosus, smoking, ultraviolet irradiation, history of warts or condylomas, and lack of circumcision. Human papilloma virus is present in a subset of penile squamous cell carcinomas. Patients may present with an exophytic or flat ulcerative mass in the glans or a large primary tumour with inguinal nodal and skin metastases. Morphologic variants include the basaloid carcinoma, warty (condylomatous) carcinoma, verrucous carcinoma, and sarcomatoid (spindle cell) carcinoma.<br><br><b>Coded Elsewhere:</b> Verrucous squamous cell carcinoma of penis (2C31.0)                        |

| <b>2C82</b>   | <b>Malignant neoplasms of prostate</b><br>Prostate cancer contributes significantly to the overall cancer burden, being the most frequent malignant neoplasia in men. The number of cases has continuously increased over the past decades, partly due to the higher life expectancy. An additional factor is the Western lifestyle, characterised by a highly caloric diet and lack of physical exercise. Epidemiological data indicates that black people are most susceptible, followed by white people, while Asian people have the lowest risk. The extent to which prostate cancer mortality can be reduced by PSA screening is currently being evaluated. Histopathological diagnosis and grading play a major role in the management of prostate cancer.<br><br><b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z) |
| <b>2C82.0</b> | <b>Adenocarcinoma of prostate</b><br>An adenocarcinoma arising from the prostate gland. It is one of the most common malignant tumours afflicting men. The majority of adenocarcinomas arise in the peripheral zone and a minority occurs in the central or the transitional zone of the prostate gland. Grading of prostatic adenocarcinoma predicts disease progression and correlates with survival. Several grading systems have been proposed, of which the Gleason system is the most commonly used. Gleason sums of 2 to 4 represent well-differentiated disease, 5 to 7 moderately differentiated disease and 8 to 10 poorly differentiated disease. Prostatic-specific antigen (PSA) serum test is widely used as a screening test for the early detection of prostatic adenocarcinoma.                                       |

|               | Cancer of the kidney amounts to 2% of the total human cancer burden, with approximately 190,000 new cases diagnosed each year. They occur in all world regions, with a preference for developed countries. Etiological factors include environmental carcinogens (tobacco smoking) and lifestyle factors, in particular obesity. Although renal tumours can be completely removed surgically, haematogeneous metastasis is frequent and may occur already at an early stage of the disease. The pattern of somatic mutations in kidney tumours has been extensively investigated and has become, in addition to histopathology, a major criterion for classification. Kidney tumours also occur in the setting of several inherited cancer syndromes, including von Hippel-Lindau disease. |

|               | A carcinoma arising from the renal parenchyma. The incidence of renal cell carcinoma has increased by 35% from 1973 to 1991. There is a strong correlation between cigarette smoking and the development of renal cell carcinoma. The clinical presentation includes: haematuria, flank pain and a palpable lumbar mass. A high percentage of renal cell carcinomas are diagnosed when an ultrasound is performed for other purposes. Diagnostic procedures include: ultrasound, intravenous pyelography and computed tomography (CT).                                                                                                                                                                                                                                                     |

| <b>2C94.1</b> | <b>Squamous cell carcinoma of urinary bladder</b><br>A squamous cell carcinoma of the bladder arising from metaplastic epithelium. It represents less than 10% of bladder carcinomas. The exception is the Middle East along the Nile Valley, where it represents the most common form of carcinoma because of the endemic nature of schistosomiasis. Bladder squamous cell carcinoma is often associated with long-standing chronic inflammation of the bladder and usually has a poor prognosis. The diagnosis of squamous cell carcinoma of the bladder should be reserved for those tumours that are predominantly keratin forming. |

## Malignant neoplasms of eye or ocular adnexa (2D00-2D0Z)

A malignant neoplasm affecting the structures of the eye.

***Exclusions:*** Malignant neoplasm of optic nerve (2A02)  
Malignant neoplasm of skin of eyelid (2C30-2C3Z)  
Malignant mesenchymal neoplasms (2B50-2B5Z)

***Coded Elsewhere:*** Melanoma of uvea (2D0Y)

| <b>2D02.0</b> | <b>Adenocarcinoma of retinal pigment epithelium</b><br>This is a cancer of an epithelium that originates in glandular tissue. Epithelial tissue includes, but is not limited to, the surface layer of skin, glands, and a variety of other tissue that lines the cavities and organs of the body. This diagnosis is with the pigmented cell layer just outside the neurosensory retina that nourishes retinal visual cells, and is firmly attached to the underlying choroid and overlying retinal visual cells. |

**2D0Z****Malignant neoplasms of eye or ocular adnexa, unspecified****Malignant neoplasms of endocrine glands (2D10-2D1Z)**

A malignant neoplasm affecting the endocrine glands. Representative examples include thyroid gland carcinoma, parathyroid gland carcinoma, pituitary gland carcinoma, and adrenal cortex carcinoma.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**2D10****Malignant neoplasms of thyroid gland**

A primary or metastatic malignant neoplasm affecting the thyroid gland.

**Exclusions:** Malignant mesenchymal neoplasms (2B50-2B5Z)

**Coded Elsewhere:** Thyroid lymphoma (2B33.5)

**2D10.0****Follicular carcinoma of thyroid gland**

A differentiated adenocarcinoma arising from the follicular cells of the thyroid gland. The nuclear features which characterise the thyroid gland papillary carcinoma are absent. Radiation exposure is a risk factor and it comprises approximately 10% to 15% of thyroid cancers. Clinically, it usually presents as a solitary mass in the thyroid gland. It is generally unifocal and thickly encapsulated and shows invasion of the capsule or the vessels. Diagnostic procedures include: thyroid ultrasound and fine needle biopsy.

**2D10.1****Papillary carcinoma of thyroid gland**

A differentiated adenocarcinoma arising from the follicular cells of the thyroid gland. Radiation exposure is a risk factor and it is the most common malignant thyroid lesion, comprising 75% to 80% of all thyroid cancers in iodine sufficient countries. Diagnostic procedures include: thyroid ultrasound, and fine needle biopsy. Microscopically, the diagnosis is based on the distinct characteristics of the malignant cells, which include enlargement, oval shape, elongation, and overlapping of the nuclei. The nuclei also display clearing or have a ground glass appearance.

**2D10.2****Poorly differentiated carcinoma of thyroid gland****2D10.3****Undifferentiated carcinoma of thyroid gland**

A primary carcinoma of the thyroid gland composed of undifferentiated cells. The malignant cells demonstrate evidence of epithelial differentiation, either by immunohistochemistry or electron microscopic studies. Microscopically, in the majority of cases there is a mixture of spindle, epithelioid, and giant cells. The vast majority of the patients present with a rapidly enlarging neck mass. The clinical course is invariably aggressive.

**Inclusions:** anaplastic carcinoma of thyroid gland

| <b>2D10.4</b> | <b>Medullary carcinoma of thyroid gland</b>                 | A neuroendocrine carcinoma arising from the C-cells of the thyroid gland. It is closely associated with multiple endocrine neoplasia syndromes. Approximately 10% to 20% of medullary thyroid carcinomas are familial. Patients usually present with a thyroid nodule that is painless and firm. In the majority of cases nodal involvement is present at diagnosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>2D10.Y</b> | <b>Other specified malignant neoplasms of thyroid gland</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>2D11</b>   | <b>Malignant neoplasms of adrenal gland</b>                 | <p>Tumours arising from the adrenal cortex include adenomas and carcinomas. These are rare neoplasms but may cause a variety of hormonal symptoms, including hyperaldosteronism, Cushing syndrome, and virilisation. A small fraction of adrenocortical tumours are associated with an inherited tumour syndrome, including Li-Fraumeni syndrome and Carney complex.</p> <p>Benign and malignant pheochromocytomas arise in the adrenal medulla and are derived from chromaffin cells of neural crest origin. Pheochromocytomas may occur in the setting of several hereditary conditions, including multiple endocrine neoplasia types 2a and 2b, von Hippel Lindau disease and neurofibromatosis.</p> <p>Extra adrenal paragangliomas arise from chromaffin cells in sympathoadrenal and parasympathetic paraganglia. They occur in many parts of the body and can pose a significant challenge to surgeons and oncologists. Some function as chemoreceptors, others are endocrinologically active. Familial paragangliomas are associated with mutations of the mitochondrial complex II genes.</p> <p><b>Exclusions:</b> Malignant mesenchymal neoplasms (2B50-2B5Z)</p> |

| <b>2D11.2</b> | <b>Neuroblastoma of adrenal gland</b>                       | Neuroblastomas are malignant tumours that form in certain types of the nerve tissue. It most often begins in the adrenal gland. About 1 out of 3 neuroblastomas start in the adrenal glands and about 1 out of 4 begin in sympathetic nerve ganglia in the abdomen. Most of the rest start in sympathetic ganglia near the spine in the chest or neck, or in the pelvis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**2D43 Malignant neoplasms of independent, multiple primary sites**

**Coding Note:** Use additional codes to identify individual neoplasms.

**2D44 Malignant neoplasm, primary site unknown, so stated**

**2D4Y Other specified malignant neoplasms of unspecified primary sites**

**2D4Z Unspecified malignant neoplasms of unspecified sites**

Malignant neoplasm metastases (2D50-2E2Z)

Spread of a malignant neoplasm into secondary sites.

**2D50 Malignant neoplasm metastasis in brain**

A malignant neoplasm that has spread to the brain from another anatomic site or system. The majority are carcinomas (usually lung or breast carcinomas).

**2D51 Malignant neoplasm metastasis in meninges**

**2D52 Malignant neoplasm metastasis in spinal cord, cranial nerves or remaining parts of central nervous system**

Malignant neoplasm metastasis in lymph nodes (2D60-2D6Z)

**Exclusions:** Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)

**2D60 Malignant neoplasm metastasis in lymph node of a single region**

**2D60.0 Malignant neoplasm metastasis in lymph nodes of head, face or neck**

**2D60.1 Malignant neoplasm metastasis in intrathoracic lymph nodes**

**2D60.2 Malignant neoplasm metastasis in intra-abdominal lymph nodes**

**2D60.3 Malignant neoplasm metastasis in axillary lymph nodes**

**2D60.4 Malignant neoplasm metastasis in inguinal lymph nodes**

**2D60.5 Malignant neoplasm metastasis in intrapelvic lymph nodes**

**2D60.Y Other specified malignant neoplasm metastasis in lymph node of a single region**

**2D60.Z Malignant neoplasm metastasis in lymph node of a single region, unspecified**

**2D61 Malignant neoplasm metastases in lymph nodes of multiple regions**

**2D6Z Metastatic malignant neoplasm to unspecified lymph node**

**2D8Z Malignant neoplasm metastasis in unspecified digestive system organ**

Malignant neoplasm metastasis in retroperitoneum or peritoneum (2D90-2D91)

**2D90 Malignant neoplasm metastasis in retroperitoneum**

**2D91 Malignant neoplasm metastasis in peritoneum**

Malignant neoplasm metastasis in other sites (2E00-2E0Y)

**2E00 Malignant neoplasm metastasis in kidney or renal pelvis**

The spread of the cancer to the kidney. This may be from a primary kidney cancer involving the opposite kidney, or from a cancer at a distant site.

**2E01 Malignant neoplasm metastasis in bladder**

Tumours of the urinary bladder that originate from an extravesical, non-urothelial tract neoplasm

**2E02 Malignant neoplasm metastasis in other or unspecified urinary system organs**

**2E03 Malignant neoplasm metastasis in bone or bone marrow**

The spread of a malignant neoplasm from a primary site to the skeletal system. The majority of metastatic neoplasms to the bone are carcinomas.

**2E04 Malignant neoplasm metastasis in soft tissue**

**2E05 Malignant neoplasm metastasis in female reproductive system**

**2E05.0 Malignant neoplasm metastasis in ovary**

The spread of the cancer to the ovary. This may be from a primary ovarian cancer involving the opposite ovary, or from a cancer at a distant site.

**2E05.Y Malignant neoplasm metastasis in other female reproductive system organs**

**2E05.Z Malignant neoplasm metastasis in female reproductive system, unspecified**

**2E06 Malignant neoplasm metastasis in male genital organs**

**2E07 Malignant neoplasm metastasis in adrenal gland**

A malignant tumour that has spread to the adrenal gland from an adjacent or distant anatomic site. The majority of cases are metastatic carcinomas, and less frequently lymphomas.

**2E08 Metastatic malignant neoplasm involving skin**

Involvement of the skin by metastatic spread from a known or unknown primary malignant neoplasm. The secondary deposit may result from local migration of malignant cells, or from regional lymphatic or haematogenous spread from more distant sites.

**2E09**      **Malignant neoplasm metastasis in peripheral nervous system**

**2E0Y**      **Malignant neoplasm metastasis in other specified sites**

**2E2Z**      **Malignant neoplasm metastasis, unspecified**

In situ neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E60-2E6Z)

**2E60**      **Carcinoma in situ of oral cavity, oesophagus or stomach**

**Exclusions:**      Melanoma in situ neoplasms (2E63)

**2E60.0**      **Carcinoma in situ of lip, oral cavity or pharynx**

**Exclusions:**      Carcinoma in situ of aryepiglottic fold, laryngeal aspect (2E62.0)

Carcinoma in situ of epiglottis nos (2E62.0)

Carcinoma in situ of epiglottis, suprahyoid portion (2E62.0)

Carcinoma in situ of skin of lip (2E64)

**2E60.1**      **Carcinoma in situ of oesophagus**

Stage 0 includes: For squamous cell carcinoma: Tis (HGD), N0, M0, G1, GX, tumour location: Any. For adenocarcinoma: Tis (HGD), N0, M0, G1, GX. Tis: High-grade dysplasia. N0: No regional lymph node metastasis. M0: No distant metastasis. G1: Well differentiated. GX: Grade cannot be assessed-stage grouping as G1. tumour location: Location of the primary cancer site is defined by the position of the upper (proximal) edge of the tumour in the esophagus.

**Coded Elsewhere:** Oesophageal adenocarcinoma in situ (2E60.1)

**2E60.2**      **Carcinoma in situ of stomach**

Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ: intraepithelial tumour without invasion of the lamina propria. N0: No regional lymph node metastasis. M0: No distant metastasis.

**2E61**      **Carcinoma in situ of other or unspecified digestive organs**

**Exclusions:**      Melanoma in situ neoplasms (2E63)

**2E61.0**      **Carcinoma in situ of colon**

Stage 0 includes: Tis, N0, M0. Tis: Carcinoma in situ: intraepithelial or invasion of lamina propria. N0: No regional lymph node metastasis. M0: No distant metastasis.

**2E61.1**      **Carcinoma in situ of rectum**

Malignant epithelial tumour of rectum that has not invaded adjacent tissue of the large intestine.

| <b>2E64.0</b>  | <p><b>Intraepidermal squamous cell carcinoma</b></p> <p>Malignant squamous neoplasia confined to the epidermis of extragenital skin and known commonly as Bowen disease. It arises most frequently on chronically sun-exposed glabrous skin of the head and neck or lower legs. It typically presents as single or multiple well-demarcated scaly erythematous patches, nodules or plaques which histologically show extensive keratinocytic atypia. It may develop from preexisting actinic keratosis (Actinic intraepidermal squamous cell carcinoma). Although it is most commonly associated with exposure to ultraviolet radiation, other carcinogens such as arsenic and tar may be implicated. Human papilloma virus may represent an additional risk factor in immunosuppressed patients.</p> |

|               | Paget disease of the nipple describes a rare presentation of breast cancer, seen most frequently in women aged 50-60, manifesting with nipple drainage and itching, erythema, crusty, excoriated nipple, thickened plaques and hyperpigmentation (less frequently). It is due to tumour cells invading the nipple-areola complex and represents 1%-3% of all new breast cancer diagnoses. |

- 2E67.11** Vulvar Paget disease
- An uncommon intraepithelial malignant neoplasm of eccrine or apocrine origin, arising from the vulva. It usually affects post-menopausal women. In approximately 10-20% of the cases there is an associated anorectal, or urothelial carcinoma or a skin appendage adenocarcinoma identified. It presents as a red, eczematous lesion. Microscopically, it is characterised by the presence of the typical Paget cells which are large, round cells with abundant cytoplasm and prominent nuclei.
- 2E67.12** Vulvar intraepithelial neoplasia, HPV-independent
- Vulvar intraepithelial neoplasia (VIN), HPV-independent, is a non-invasive precursor of HPV-independent squamous cell carcinoma of the vulva, characterized by atypia of the basal and parabasal keratinocytes in an otherwise well-differentiated epithelium.
- Exclusions:** Low grade squamous intraepithelial lesion of vulva (GA13.1)
- 2E67.13** High grade squamous intraepithelial lesion of vulva, HPV-associated
- Squamous intraepithelial lesions (SILs) of the vulva (also known as vulvar intraepithelial neoplasia [VIN]), HPV-associated, are proliferations of squamous cells driven by HPV infection, showing maturation abnormalities and nuclear hyperchromasia that do not extend beyond the basement membrane.
- Coded Elsewhere:** Bowenoid papulosis of the vulva (1A95.1)
- 2E67.2** **Carcinoma in situ of vagina**
- 2E67.22** High grade squamous intraepithelial lesion of vagina
- 2E67.2Y** Other specified carcinoma in situ of vagina
- 2E67.2Z** Carcinoma in situ of vagina, unspecified
- 2E67.3** **Carcinoma in situ of other or unspecified female genital organs**
- 2E67.4** **Carcinoma in situ of penis**
- This comprises both squamous carcinoma in situ and extramammary Paget disease of the penis. The former is an uncommon precancerous disease of penile skin. Lesions usually appear on the glans or inner aspect of the foreskin and are almost always found in uncircumcised men. If left untreated, 10-30% of cases develop into invasive squamous cell carcinoma of the penis. When it affects the skin of the shaft or prepuce it is commonly called Bowen disease. If it affects the glans or inner surface of the prepuce it may also be referred to as penile intraepithelial neoplasia (or in the past as erythroplasia of Queyrat). Extramammary Paget disease of penis is a rare form of carcinoma in situ involving penile skin or glans penis.
- Coded Elsewhere:** Extramammary Paget disease of penis (2E64.1)
- 2E67.40** Squamous cell carcinoma in situ of skin of penis
- Squamous cell carcinoma affecting the skin of the prepuce or of the shaft of the penis and commonly called Bowen disease. HPV infection and chronic exposure to psoralen photochemotherapy are predisposing factors.
- Inclusions:** Bowen disease of skin of penis

## Benign neoplasms, except of lymphoid, haematopoietic, central nervous system or related tissues (2E80-2F5Z)

A neoplasm which is characterised by the absence of morphologic features associated with malignancy (severe cytologic atypia, tumour cell necrosis, and high mitotic rate). Benign neoplasms remain confined to the original site of growth and only rarely metastasize to other anatomic sites.

Benign mesenchymal neoplasms (2E80-2E8Z)

Benign neoplasms of muscle, fat, fibrous tissue, bone, cartilage, and blood vessels.

| <b>2E81.2</b>  | <b>Benign vascular neoplasms of infancy and childhood</b><br>The commonest benign vascular neoplasm of infancy is infantile haemangioma. Less common neoplasms are congenital haemangioma, spindle cell haemangioma, tufted angioma and kaposiform haemangioendothelioma.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>2E81.20</b> | <b>Focal infantile haemangioma</b><br>Infantile haemangioma is a common benign vascular neoplasm which develops in about 4% of infants. It appears within weeks of birth as a blanched, blushed, or telangiectatic area that then rapidly proliferates for several months before entering a prolonged process of involution lasting up to 12 years, leaving a residual variably prominent scar. A solitary focal tumour is seen in about 85% of cases. Over half of cases are located on the head and neck. Complications include bleeding, infection, ulceration and, in tumours situated close to the eye, amblyopia.<br><b>Inclusions:</b> Strawberry naevus |
| <b>2E81.21</b> | <b>Multifocal infantile haemangioma</b><br>Infantile haemangioma is multifocal in up to 25% of cases with numbers ranging from a few to many dozens. If more than 5 cutaneous tumours are present there is an increased risk of associated internal haemangiomatosis, especially of the liver.                                                                                                                                                                                                                                                                                                                                                                  |

**2E82.1 Benign chondrogenic tumours of bone or articular cartilage of other specified sites**

**2E82.Z Benign chondrogenic tumours, site unspecified**

**2E83 Benign osteogenic tumours**

A neoplasm arising from the bone or articular cartilage that does not invade adjacent tissues or metastasize to other anatomic sites. Representative examples include benign fibrous histiocytoma of bone, osteoma, osteoblastoma, chondroblastoma, and enchondroma.

**2E83.0 Benign osteogenic tumours of bone or articular cartilage of skull or face**

**2E83.1 Benign osteogenic tumours of bone or articular cartilage of lower jaw**

**2E83.2 Benign osteogenic tumours of bone or articular cartilage of vertebral column**

**Exclusions:** Benign osteogenic tumour of sacrum (2E83.4)

**2E83.3 Benign osteogenic tumours of bone or articular cartilage of ribs, sternum or clavicle**

**2E83.4 Benign osteogenic tumours of bone or articular cartilage of pelvic bones, sacrum or coccyx**

**2E83.5 Benign osteogenic tumours of bone or articular cartilage of limbs**

**2E83.Y Benign osteogenic tumour of other specified site**

**2E83.Z Benign osteogenic tumour of unspecified site**

**2E84 Benign fibrogenic or myofibrogenic tumour**

**2E84.0 Benign fibrogenic or myofibrogenic tumour of skin**

**2E84.Y Benign fibrogenic or myofibrogenic tumour of other specified sites**

**2E84.Z Benign fibrogenic or myofibrogenic tumour, site unknown**

**2E85 Benign fibrohistiocytic tumour**

**Exclusions:** Benign neoplasm of peripheral nerves or autonomic nervous system (2E90-2F3Z)

Benign lymphatic neoplasms (2E81.1)

Benign lipomatous neoplasm (2E80)

Haemangioma (2E81)

Benign neoplasm of uterine ligament, any (2F31)

Benign vascular neoplasms (2E81)

Leiomyoma of uterus (2E86.0)

Benign neoplasm of connective tissue of breast (2F30)

**2E85.0 Benign fibrohistiocytic tumour of soft tissues of limbs**

- 2F00 Benign neoplasm of middle ear or respiratory system**
- 2F00.0 Middle ear endocrine tumour**
- 2F00.1 Recurrent respiratory papillomatosis**  
Recurrent respiratory papillomatosis is a rare respiratory disease characterised by the development of exophytic papillomas, affecting the mucosa of the upper aerodigestive tract (with a strong predilection for the larynx), caused by an infection with human papilloma virus. Symptoms at presentation may include hoarseness, chronic cough, dyspnoea, recurrent upper respiratory tract infections, pneumonia, dysphagia, stridor, and/or failure to thrive.
- 2F00.2 Laryngeal endocrine tumour**
- 2F00.Y Other specified benign neoplasm of middle ear or respiratory system**
- 2F00.Z Benign neoplasm of middle ear or respiratory system, unspecified**

| <b>2F26</b>   | <b>Lobular capillary haemangioma</b><br>Historically called pyogenic granuloma, this is a common benign proliferation of capillary blood vessels which may be induced by trauma or by certain drugs. It presents as one or more bright red papules or nodules often located around the mouth or on a terminal phalanx in relation to the nail. Bleeding, ulceration and crusting frequently occur. BRAF mutations within vascular endothelial cells may be present, indicating that this is, in at least a proportion of cases, a true neoplastic process.<br><i>Inclusions:</i> Lobular capillary haemangioma of skin |

| <b>2F30.2</b> | <b>Intraductal papilloma of breast</b><br>A benign papillary neoplasm that arises anywhere in the ductal system of the breast. It is characterised by fibrovascular structures lined by benign epithelial and myoepithelial proliferations. Intraductal breast papillomas are classified as central, when they arise in large ducts, or peripheral, when they arise in the terminal ductal lobular units.                                                                                                                                  |
| <b>2F30.3</b> | <b>Benign phyllodes tumour of breast</b><br>A usually unilateral, benign and well circumscribed biphasic neoplasm that arises from the breast. It usually affects middle-aged women. It is characterised by the presence of a double layer of epithelial cells that are arranged in clefts, surrounded by a cellular, monomorphic spindle cell mesenchymal component. Mitoses are rare. Necrotic changes may be present in large tumours.                                                                                                  |

| <b>2F30.5</b> | <b>Fibroadenoma of breast</b><br>A benign tumour of the breast characterised by the presence of stromal and epithelial elements. It presents as a painless, solitary, slow growing, firm, and mobile mass. It is the most common benign breast lesion. It usually occurs in women of childbearing age. The majority of fibroadenomas do not recur after complete excision. A slightly increased risk of developing cancer within fibroadenomas or in the breast tissue of patients previously treated for fibroadenomas has been reported. |
| <b>2F30.6</b> | <b>Extensive adenomatosis of nipple</b><br>Rare benign nipple condition presenting as pruritus, burning or pain symptoms with clinical signs showing a nipple which appears ulcerated, crusting, scaling, indurated and erythematous. Differential diagnosis are Paget, psoriasis, etc.                                                                                                                                                                                                                                                    |

## Neoplasms of uncertain behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F70-2F7Z)

A neoplasm displaying morphologic, phenotypic, or genotypic characteristics that are clearly not benign but do not permit the establishment of a definitive diagnosis of malignancy. Such neoplasms may or may not eventually have a more aggressive clinical course. Representative examples include lymphoproliferations of uncertain malignant potential (e.g., lymphomatoid granulomatosis and lymphomatoid papulosis), borderline ovarian epithelial neoplasms (e.g., borderline ovarian endometrioid tumour and borderline ovarian mucinous tumour), borderline exocrine pancreatic neoplasm (e.g., pancreatic borderline intraductal papillary-mucinous neoplasm), and primary borderline peritoneal epithelial neoplasm.

|               | A spindle cell and epithelioid cell melanocytic neoplasm in which there are sufficient features distinguishing it from a benign Spitz naevus to cast doubt on its benign nature. These atypical features include development in adult life, asymmetry, large diameter (>6 and especially >10 mm), significant thickness (particularly subcutaneous extension), lack of “maturation” and nodule formation, cytological atypia and a high mitotic rate.                         |
| <b>2F72.2</b> | <b>Melanocytic naevus with severe melanocytic dysplasia</b>                                                                                                                                                                                                                                                                                                                                                                                                                   |
|               | Melanocytic naevus with severe melanocytic dysplasia is a histopathological diagnosis based on the presence of severe cytological atypia, defined as enlarged, spindle- and epithelioid-shaped melanocytes with hyperchromatic nuclei (typically at least twice the size of those of basal keratinocytes) and distinct nucleoli. Such naevi tend to be irregular in size and pigmentation and to have been excised because of concern that they may represent early melanoma. |

| <b>2F7Z</b>   | <b>Neoplasms of uncertain behaviour of unspecified site</b>                                                                                                                                                                                                                                                                                                                                                                                                                   |

Neoplasms of unknown behaviour, except of lymphoid, haematopoietic, central nervous system or related tissues (2F90-2F9Z)

**Coded Elsewhere:** Pathological fracture in neoplastic disease of unknown behaviour (FB80.B)

**2F90 Neoplasms of unknown behaviour of oral cavity or digestive organs**

**2F90.0 Neoplasms of unknown behaviour of colon**

**2F90.1 Neoplasms of unknown behaviour of rectum**

**2F90.Y Neoplasms of unknown behaviour of oral cavity or digestive organs, other specified site**

**2F90.Z Neoplasms of unknown behaviour of oral cavity or digestive organs, unspecified site**

**2F91 Neoplasms of unknown behaviour of middle ear, respiratory or intrathoracic organs**

**2F91.0 Neoplasms of unknown behaviour of larynx**

**2F91.1 Neoplasms of unknown behaviour of trachea, bronchus or lung**

**2F91.Y Neoplasms of unknown behaviour of other specified respiratory organ, intrathoracic organ or middle ear**

**2F91.Z Neoplasms of unknown behaviour of unspecified respiratory organ or intrathoracic organ**

**2F92 Neoplasms of unknown behaviour of skin**

**2F93 Neoplasms of unknown behaviour of retroperitoneum**

**2F94 Neoplasms of unknown behaviour of peritoneum**

**2F95 Neoplasms of unknown behaviour of breast**

**2F96 Neoplasms of unknown behaviour of female genital organs**

**2F97 Neoplasms of unknown behaviour of male genital organs**

**2F98 Neoplasms of unknown behaviour of urinary organs**

**2F99 Neoplasms of unknown behaviour of eye or ocular adnexa**

**2F9A Neoplasms of unknown behaviour of endocrine glands**

**2F9B Neoplasms of unknown behaviour of bone or articular cartilage**

**2F9C Neoplasms of unknown behaviour of connective or other soft tissue**

**2F9Y Neoplasms of unknown behaviour of other specified site**

**2F9Z Neoplasms of unknown behaviour of unspecified site**

## CHAPTER 03

---

### Diseases of the blood or blood-forming organs

This chapter has 56 four-character categories.

Code range starts with 3A00

This chapter includes diseases of the blood as well as diseases of blood forming organs.

- Exclusions:**
- Complications of pregnancy, childbirth or the puerperium (Chapter 18)
  - Diseases of the immune system (Chapter 04)
  - Certain conditions originating in the perinatal period (Chapter 19)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)
  - Human immunodeficiency virus disease (1C60-1C62.Z)
  - Endocrine, nutritional or metabolic diseases (Chapter 05)
  - Congenital malformations, deformations or chromosomal abnormalities (Chapter 20)
  - Other diseases of the blood or blood-forming organs or certain disorders involving the immune mechanism complicating pregnancy, childbirth or the puerperium (JB64.1)
- Coded Elsewhere:**
- Neoplasms of haematopoietic or lymphoid tissues (2A20-2B3Z)
  - Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA10-MA3Y)

This chapter contains the following top level blocks:

- Anaemias or other erythrocyte disorders
- Coagulation defects, purpura or other haemorrhagic or related conditions
- Diseases of spleen

## Anaemias or other erythrocyte disorders (3A00-3A9Z)

**Inclusions:** Anaemia, unspecified

**Coded Elsewhere:** Anaemia complicating pregnancy, childbirth or the puerperium (JB64.0)  
Anaemia of prematurity (KA8B)

### Nutritional or metabolic anaemias (3A00-3A03.Y)

#### **3A00**

#### **Iron deficiency anaemia**

A disease caused by chronic or acute bleeding, excessive menstrual bleeding, inadequate intake, substances (in diet or drugs) interfering with iron absorption, malabsorption syndromes, inflammation, infection or blood donation. This disease is characterised by decreased levels of iron present in the body. This disease may present with fatigue, pallor or dizziness. Confirmation is by identification of decreased levels of iron in a blood sample.

#### **3A00.0**

#### **Acquired iron deficiency anaemia due to blood loss**

Chronic blood loss is a possible cause in every case of iron-deficiency anaemia. Iron deficiency anaemia may be caused by acute bleeding in gastrointestinal tract, uterus or genitourinary system, copious menstrual blood losses (menorrhagia) and multiple blood donations. In many tropical countries, infestations with hookworms lead to intestinal blood losses that in some individuals can be considerable. Iron deficiency may also be caused by several circumstances related to "chronic posthaemorrhagic anaemia". A diagnosis of iron deficiency should always lead to a search for pathologic causes of blood loss (e.g. tumours in the gastrointestinal tract or uterus, especially if uterine bleedings have increased or changed in regularity).

**Exclusions:** congenital anaemia from fetal blood loss (KA8C)

#### **3A00.01**

#### **Chronic posthaemorrhagic anaemia**

Chronic iron-deficiency anaemia from bleeding may be caused by colon cancer, gastric cancer, peptic ulcer, Meckel diverticulum, hiatal hernia with linear erosions, colonic vascular ectasia, colonic polyps, haemangioma, inflammatory bowel disease, tumours in the gastrointestinal tract or uterus, and chronic menorrhagia. Some infants with severe iron deficiency have chronic intestinal blood loss induced by exposure to cow's milk protein. Repeated phlebotomy for blood tests is a cause of anaemia of prematurity.

#### **3A00.0Z**

#### **Acquired iron deficiency anaemia due to blood loss, unspecified**

#### **3A00.1**

#### **Acquired iron deficiency anaemia due to low intake**

Iron deficiency is probably the most common nutritional deficiency disorder in the world. Iron deficiency anaemia during pregnancy increases perinatal risks for mothers and neonates; and increases overall infant mortality. Severe anaemia is a major risk factor associated with greatly increased morbidity and mortality for young children and pregnant women. Prompt recognition of the condition, treatment and clinical follow-up of individuals are crucial in avoiding complications such as high-output heart failure. Maternal iron deficiency during pregnancy increases the risk of iron deficiency in the infant. In less developed countries, the prevalence of iron deficiency during pregnancy is higher than in developed countries, and iron supplementation during pregnancy is beneficial.

- 3A00.2      **Acquired iron deficiency anaemia due to decreased absorption**
- 3A00.3      **Acquired iron deficiency anaemia due to increased requirement**
- 3A00.Y      **Other specified iron deficiency anaemia**
- 3A00.Z      **Iron deficiency anaemia, unspecified**

### **3A01**

#### **Megaloblastic anaemia due to vitamin B12 deficiency**

A disease caused by inadequate dietary intake of vitamin B12, impaired absorption of vitamin B12, surgical removal of the small bowel, coeliac disease or inherited mutations affecting absorption of vitamin B12. This disease is characterised by decreased levels of vitamin B12 in the body presenting with or without anaemia. This disease may present with fatigue, pallor, dizziness, seizures, or symptoms of dementia. Confirmation is by identification of decreased levels of vitamin B12 in a blood sample.

#### **3A01.0      Hereditary vitamin B12 deficiency anaemia**

This is a hereditary low blood level of vitamin B12. It can cause permanent damage to nervous tissue if left untreated long enough. Vitamin B12 itself was discovered through investigation of pernicious anaemia, which is an autoimmune disease that destroys parietal cells in the stomach that secrete intrinsic factor.

#### **3A01.1      Neonatal vitamin B12 deficiency anaemia**

A disease caused by a lack of vitamin B12 in the mother, which is passed onto the fetus in the antenatal period or to the neonate during breast feeding. This disease is characterised by decreased levels of vitamin B12. This disease may present with increased risk of birth defects or preterm delivery, anaemia, irritability, failure to thrive or apathy. Confirmation is by identification of low levels of vitamin B12 in a blood sample.

**Exclusions:**              Hereditary vitamin B12 deficiency anaemia (3A01.0)

#### **3A01.2      Vitamin B12 deficiency anaemia due to low intake**

A disease caused by insufficient intake of vitamin B12 into the body. This disease is characterised by low levels of vitamin B12 leading to low levels of red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of vitamin B12 and red blood cell count in a blood sample.

#### **3A01.3      Vitamin B12 deficiency anaemia due to intrinsic factor deficiency**

**Exclusions:**              Vitamin B12 deficiency anaemia due to congenital intrinsic factor deficiency (3A01)

#### **3A01.30      Pernicious anaemia**

Acquired pernicious anaemia, also called Biermer's disease, is a disorder in vitamin B12 (cobalamin) absorption characterised by megaloblastic anaemia and gastrointestinal symptoms, and that can lead to neurological abnormalities.

#### **3A01.3Y      Other specified vitamin B12 deficiency anaemia due to intrinsic factor deficiency**

**3A01.4 Vitamin B12 deficiency anaemia due to intestinal disease**

A number of intestinal disorders can also cause vitamin B12 (cobalamin) deficiency. These include severe pancreatic diseases and small bowel diseases such as malabsorption, ileal disease (including tuberculous ileitis, lymphoma, amyloid, long-term survivors of pelvic irradiation), extensive small bowel resection or bypass, gastric surgery/reconstruction for obesity (bariatric surgery) and Crohn's disease. When jejunal blind loops are present, bacterial overgrowth within the loops competes for cobalamin, leading to cobalamin deficiency. Although not as common currently, infestation with the fish tapeworm, *Diphyllobothrium latum*, was once a classic cause of cobalamin deficiency.

**Coding Note:** Code also the causing condition

**3A01.5 Drug-induced vitamin B12 deficiency anaemia**

**3A01.Y Other specified megaloblastic anaemia due to vitamin B12 deficiency**

**3A01.Z Megaloblastic anaemia due to vitamin B12 deficiency, unspecified**

**3A02 Folate deficiency anaemia**

**3A02.0 Hereditary folate deficiency anaemia**

**3A02.1 Folate deficiency anaemia due to low intake**

**3A02.2 Folate deficiency anaemia due to increased requirements**

**3A02.3 Folate deficiency anaemia due to decreased intestinal absorption**

A disease caused by determinants affecting intestinal absorption of folate arising after birth. This disease is characterised by low levels of folate in the body leading to incomplete formation of red blood cells resulting in large numbers of immature and incompletely developed red blood cells. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, tachycardia or extremity paraesthesia. Confirmation is by identification of low folate levels in a blood sample.

**Coding Note:** Code also the causing condition

**3A02.4 Drug-induced folate deficiency anaemia**

**3A02.Y Other specified folate deficiency anaemia**

**3A02.Z Folate deficiency anaemia, unspecified**

**3A03 Other nutritional or metabolic anaemias**

A disease caused by nutritional and metabolic determinants leading to anaemia. This disease is characterised by decreased levels of red blood cells within the body. This disease may present with fatigue, pallor or dizziness. Confirmation is by identification of a decreased red blood cell count in a blood sample.

**Coded Elsewhere:** Disorders of pyrimidine metabolism (5C55.1)  
Lesch-Nyhan syndrome (5C55.01)

- 3A03.0 Hereditary orotic aciduria**  
Hereditary orotic aciduria is an extremely rare (less than 20 cases identified worldwide) autosomal recessive disorder characterised by retarded growth, anaemia and excessive urinary excretion of orotic acid. It is due to a severe deficiency in the activity of the pyrimidine pathway enzyme uridine 5'-monophosphate (UMP) synthase (bifunctional enzyme containing two activities: orotate phosphoribosyltransferase and orotidine 5'-monophosphate decarboxylase), coded by a single gene (UMPS) localised to chromosome 3q13.
- 3A03.1 Protein deficiency anaemia**  
A disease caused by low levels of protein within the body. This disease is characterised by a low red blood cell count in the blood. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of a low red blood cell count in a blood sample.  
**Exclusions:** Lesch-Nyhan syndrome (5C55.01)
- 3A03.2 Scorbutic anaemia**  
Scorbutic anaemia is a common finding in infants and young children with scurvy and is related to impaired iron absorption and coexistent haematopoietic nutrient deficiencies including iron, vitamin B12 and folate.
- 3A03.3 Copper deficiency anaemia**  
Anaemia due to copper deficiency arises from impaired utilization of iron and is therefore a conditioned form of iron deficiency anaemia.
- 3A03.4 Acquired other vitamin B deficiency anaemia**  
A disease caused by a lack of B vitamins in the body arising after birth. This disease is characterised by low levels of B vitamins leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count and low B vitamin counts in a blood sample.
- 3A03.40 Acquired pyridoxine deficiency anaemia**  
A disease caused by determinants arising after birth. This disease is characterised by low levels of pyridoxine (vitamin B6) leading to low levels of red blood cells in the body. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of pyridoxine and low red blood cell count in a blood sample.
- 3A03.41 Acquired riboflavin deficiency anaemia**  
A disease caused by determinants arising after birth. This disease is characterised low levels of riboflavin (vitamin B2) leading to low levels of red blood cells in the body. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of riboflavin and low red blood cell count in a blood sample.

- 3A03.42**      **Acquired thiamine deficiency anaemia**  
 A disease caused by a lack of thiamine arising after birth. This disease is characterised low levels of thiamine in the body leading to low levels of red blood cells. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities. Confirmation is by identification of low levels of thiamine and low red blood cell count in a blood sample.
- 3A03.4Y**      **Other specified acquired other vitamin B deficiency anaemia**
- 3A03.5**      **Acquired vitamin A deficiency anaemia**
- 3A03.6**      **Acquired vitamin E deficiency anaemia**  
*Inclusions:*      Haemolytic anaemia due to vitamin E deficiency
- 3A03.Y**      **Other and unspecified nutritional or metabolic anaemia**

#### Haemolytic anaemias (3A10-3A4Z)

A disease caused by determinants arising after birth, during the antenatal period or genetically inherited factors leading to premature haemolysis of red blood cells. This disease is characterised by low levels of red blood cells in the body due to abnormal breakdown of the cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

#### Congenital haemolytic anaemia (3A10-3A1Y)

A disease caused by determinants arising in the antenatal period. This disease is characterised by low levels of red blood cells in the body due to abnormal destruction of the red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

**Coded Elsewhere:** Haemolytic disease of fetus or newborn (KA84)

### **3A10**      **Hereditary haemolytic anaemia**

#### **3A10.0**      **Haemolytic anaemias due to hexose monophosphate shunt or glutathione metabolism anomalies**

This is a form of anaemia due to haemolysis, the abnormal breakdown of red blood cells (RBCs), either in the blood vessels (intravascular haemolysis) or elsewhere in the human body (extravascular). This diagnosis is due to a process that generates NADPH and pentoses (5-carbon sugars) and glutathione metabolism anomalies.

- 3A10.00**      **Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency**  
 Glucose-6-phosphate dehydrogenase (G6PD) deficiency is the most common hereditary erythrocyte enzyme deficiency that can manifest with severe neonatal jaundice which can lead to serious neurological consequences, or, most often, with acute haemolytic anaemia following ingestion of certain foods (fava beans), common drugs (some antimalaria drugs, sulphamides, analgesics), or in the course of an infection, in otherwise asymptomatic individuals.

## Acquired haemolytic anaemia (3A20-3A2Z)

A disease characterised by premature destruction of red blood cells arising after birth. This disease is further characterised by low levels of red blood cells in the body due to abnormal destruction of the cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

|             |                                                                                                                                                                                                                                                                                                                                                                              |

- 3A20.0 Autoimmune haemolytic anaemia, warm type**
- Autoimmune haemolytic anaemia (AIHA) is an autoimmune disorder in which various types of auto-antibodies are directed against red blood cells causing their survival to be shortened and resulting in haemolytic anaemia. AIHA can be primary (idiopathic), secondary to infection or associated with diseases such as B-cell lymphomas, other systemic or organ-specific autoimmune diseases, Hodgkin's disease, hepatitis or primary immunodeficiencies, or, in the case of drug-induced AIHA, caused by a reaction to drugs.
- Exclusions:** Evans syndrome (3A20.5)  
Haemolytic disease of fetus or newborn (KA84)  
Paroxysmal cold haemoglobinuria (3A20.3)
- 3A20.1 Autoimmune haemolytic anaemia, cold type**
- Cold autoimmune haemolytic anaemia comprises two types of autoimmune haemolytic anaemia (AIHA) defined by the presence of cold autoantibodies (autoantibodies which are active at temperatures below 30°C): cold agglutinin disease (CAD), which is the more common, and paroxysmal cold haemoglobinuria (PCH). CAD is more common in people over the age of 55 years, while PCH typically presents in young children. CAD is caused by IgM autoantibodies while PCH is caused by an IgG immunoglobulin.
- Exclusions:** Immune thrombocytopenic purpura (3B64.10)  
Haemolytic disease of fetus or newborn (KA84)
- 3A20.2 Autoimmune haemolytic anaemia, mixed type, cold and warm**
- Mixed autoimmune haemolytic anaemia is a type of autoimmune haemolytic anaemia (AIHA) defined by the presence of both warm and cold autoantibodies, which have a deleterious effect on red blood cells at either body temperature or at lower temperatures.
- 3A20.3 Paroxysmal cold haemoglobinuria**
- Paroxysmal cold hemoglobinuria is a very rare subtype of autoimmune haemolytic anaemia (AIHA), caused by the presence of cold-reacting autoantibodies in the blood and characterised by the sudden presence of hemoglobinuria, typically after exposure to cold temperatures. PCH is thought to account for at most 2-10% of cases of AIHA.
- 3A20.4 Alloimmune haemolytic anaemia**
- A disease caused by determinants such as a blood transfusion that lead to an immune response directed against the person's own red blood cells. This disease is characterised by low levels of red blood cells in the body due to abnormal destruction of the red blood cells. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.
- Exclusions:** Haemolytic disease of fetus or newborn (KA84)

|               |                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>3A50.1</b>  | <p><b>Alpha thalassaemia related syndromes</b></p> <p>Alpha-thalassemia-related diseases refers to a group of diseases characterised by alpha-thalassemia and an associated disorder. Three conditions are included in this group: alpha-thalassemia-intellectual deficit syndrome, X-linked (or ATR-X syndrome), alpha-thalassemia-intellectual deficit syndrome and alpha-thalassemia-myelodysplastic disease or ATMDs.</p>          |
| <b>3A50.2</b>  | <p><b>Beta thalassaemia</b></p> <p>Beta-thalassemia (BT) is a haemoglobinopathy characterised by deficiency (Beta+) or absence (Beta0) of synthesis of the beta globin chains of haemoglobin (Hb). Three main types of BT have been described: minor, intermedia and major with clinical presentation ranging from asymptomatic forms to microcytic anaemia and splenomegaly due to defective erythropoiesis and haemolysis.</p>       |
| <b>3A50.3</b>  | <p><b>Delta, delta-beta or gamma-delta-beta thalassaemia</b></p> <p>Delta-beta-thalassemia is a form of beta-thalassemia characterised by decreased or absent synthesis of the delta- and beta-globin chains with a compensatory increase in expression of fetal gamma-chain synthesis.</p>                                                                                                                                            |
| <b>3A50.4</b>  | <p><b>Hereditary persistence of fetal haemoglobin</b></p> <p>Hereditary persistence of fetal haemoglobin (HPFH) associated with beta-thalassaemia is a haemoglobinopathy characterised by high haemoglobin (Hb)F levels and an increased number of fetal-Hb-containing cells. The association of HPFH with beta-thalassaemia mitigates the clinical manifestations which vary from a normal state to beta-thalassaemia intermedia.</p> |
| <b>3A50.Y</b>  | <b>Other specified thalassaemias</b>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>3A50.Z</b>  | <b>Thalassaemias, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                      |

**3A51****Sickle cell disorders or other haemoglobinopathies**

Any disorder caused by a HbS mutation in the haemoglobin gene. This disorder is characterised by abnormal rigid sickle-shaped red blood cells decreasing its ability to carry oxygen. This disorder may present with fatigue, shortness of breath, dizziness, headaches, pallor of skin or mucous membranes, and jaundice. This disorder is confirmed by identification of HbS mutation by genetic testing.

**Coded Elsewhere:** Osteonecrosis due to haemoglobinopathy (FB81.4)

Other sickle-cell disorders with retinopathy (9B71.Y)

**3A51.0****Sickle cell trait**

A disease caused by genetic inheritance of one abnormal allele of the haemoglobin gene. This disease does not display the severe symptoms of sickle cell disease that occurs in homozygous individuals. Confirmation is by identification of mutation through genetic testing.

**3A51.1****Sickle cell disease without crisis**

A disorder caused by a HbS mutation in the haemoglobin gene. This disorder is characterised by abnormal rigid sickle-shaped red blood cells decreasing its ability to carry oxygen. This disorder may present with fatigue, shortness of breath, dizziness, headaches, pallor of skin or mucous membranes, and jaundice. This disorder is confirmed by identification of HbS mutation by genetic testing.

**3A51.2****Sickle cell disease with crisis**

Sickle cell crisis occurs when the sickle cells block blood flow, thus decreasing oxygen delivery to the tissues. This results in intense to severe pain in the extremities, lower back, abdomen, and chest. A crisis can be brought on by illness, stress, dehydration, exposure to temperature changes or high altitudes.

**Inclusions:** Hb-SS disease with crisis

**3A51.3****Compound heterozygous sickling disorders without crisis**

A disease caused by genetic inheritance of two heterozygous recessive alleles of the haemoglobin gene leading to abnormal formation of haemoglobin molecule. This disease is characterised by rigid, sickle shaped red blood cells. Confirmation is by identification of mutations through genetic testing.

**3A51.4****Compound heterozygous sickling disorders with crisis**

Compound heterozygous sickling disorders with crisis may present with acute chest syndrome, splenic sequestration, haemolytic crisis, and pain.

**3A51.5****Haemoglobin C disease**

A disease caused by the bi-parental gene that encodes for haemoglobin C. This disease is characterised by abnormal structure of one of the globin chains of the haemoglobin molecule. This disease may present with mild haemolytic anaemia, increased risk for gallstones, enlarged spleen, episodes of joint pain, and increased risk of infection. This disease is confirmed by identification of the haemoglobin C gene by genetic testing.

**Exclusions:** Hereditary persistence of fetal haemoglobin (3A50.4)

- 3A51.6 Haemoglobin D disease**  
Haemoglobin D (Hb D) disease is characterised by mild haemolytic anaemia and mild to moderate splenomegaly. Prevalence is unknown. Heterozygous forms of Hb D are clinically silent. Molecular testing can be useful to distinguish Hb D homozygosity from cases of heterozygous Hb D in association with beta-(0) thalassaemia.
- 3A51.7 High affinity haemoglobin**  
A disease caused by determinants arising after birth, in the antenatal period or by genetically inherited factors leading to high oxygen affinity haemoglobin. This disease is characterised by abnormalities in the globin chains that alter the affinity of the haemoglobin molecule for oxygen, affecting the normal loading of oxygen in the lungs and delivery of oxygen to the tissues.
- 3A51.8 Low affinity haemoglobin**  
A disease caused by determinants arising after birth, in the antenatal period or by genetically inherited factors leading to low oxygen affinity haemoglobin. This disease is characterised by abnormalities in the globin chains that alter the affinity of the haemoglobin molecule for oxygen, affecting the normal loading of oxygen in the lungs and delivery of oxygen to the tissues. This disease may present with fatigue, muscle weakness, loss of appetite, weight loss, diarrhoea, nausea, fast heartbeat or numbness in extremities.
- 3A51.9 Haemoglobin O disease**  
A disease caused by the bi-parental inheritance of the gene that encodes for haemoglobin O. This disease is characterised by abnormal structure of one of the globin chains of the haemoglobin molecule. This disease may present with mild haemolytic anaemia, increased risk for gallstones, enlarged spleen, episodes of joint pain, and increased risk of infection. This disease is confirmed by identification of the haemoglobin O gene by genetic testing.
- 3A51.A Haemoglobin E disease**  
Haemoglobin E disease is characterised by the synthesis of an abnormal haemoglobin called haemoglobin E (HbE), instead of the normal haemoglobin A (HbA). Subjects heterozygous for HbE (AE) have an asymptomatic condition with no clinical relevance, except for the risk of transmitting E/beta thalassemia if the other parent carries beta thalassemia. The severity of these E/beta thalassemia forms is very variable, the clinical picture ranging from that of beta thalassemia minor through to thalassemia intermedia to thalassemia major. Subjects homozygous for HbE (EE) are asymptomatic.
- 3A51.B Haemoglobin C/beta thalassaemia compound heterozygosity**  
Haemoglobin C/beta thalassaemia is a condition resulting from coinheritance of haemoglobin C and beta thalassaemia, both beta globin genes being mutated.
- 3A51.Y Other specified sickle cell disorders or other haemoglobinopathies**
- 3A51.Z Sickle cell disorders or other haemoglobinopathies, unspecified**

## Pure red cell aplasia (3A60-3A6Z)

A condition caused by determinates arising during the antenatal period, after birth or genetically inherited factors, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of abnormally formed erythrocytes in a blood sample.

### 3A60

#### **Congenital pure red cell aplasia**

A condition caused by determinants arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased red blood cell count in a blood sample.

#### **3A60.0**

##### **Congenital non-inherited pure red cell aplasia**

A condition caused by determinates arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased levels of red blood cells in a blood sample.

#### **3A60.1**

##### **Hereditary pure red cell aplasia**

A condition caused by determinates arising during the antenatal period, leading to a change in the formation of erythrocytes. This condition is characterised by maturation arrest occurring in the formation of erythrocytes. This condition may present with severe anaemia. Confirmation is by identification of decreased red blood cell count in a blood sample.

#### **3A60.Z**

##### **Congenital pure red cell aplasia, unspecified**

### 3A61

#### **Acquired pure red cell aplasia**

A condition characterised by the near absence of red blood cell precursors in bone marrow, often associated with thymomas and autoimmune disorders

**Exclusions:** Aplastic anaemia with paroxysmal nocturnal haemoglobinuria (3A70.1)

#### **3A61.0**

##### **Acute acquired pure red cell aplasia**

This refers to transient (acute) and acquired type of anaemia affecting the precursors to red blood cells but not to white blood cells. In PRCA, the bone marrow ceases to produce red blood cells.

#### **3A61.1**

##### **Chronic acquired pure red cell aplasia**

This refers to a chronic and acquired type of anaemia affecting the precursors to red blood cells but not to white blood cells. In PRCA, the bone marrow ceases to produce red blood cells.

#### **3A61.Y**

##### **Other specified acquired pure red cell aplasia**

#### **3A61.Z**

##### **Acquired pure red cell aplasia, unspecified**

### 3A6Z

#### **Pure red cell aplasia, unspecified**

**3A70****Aplastic anaemia**

A disease caused by determinants arising after birth, in the antenatal period or genetically inherited factors leading to the inability of stem cells to generate new mature cells. This disease is characterised by low levels of red blood cells, white blood cells, and platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising or bleeding.

**Inclusions:** Medullary hypoplasia  
Panmyelophthisis

**3A70.0****Congenital aplastic anaemia**

A disease caused by determinants in the antenatal period leading to the inability of stem cells to generate new mature cells. This disease is characterised by low levels of red blood cells, white blood cells, platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising or bleeding.

**Inclusions:** familial hypoplastic anaemia  
Constitutional medullar aplasia

**Exclusions:** Congenital amegakaryocytic thrombocytopenia (3B64.01)

**Coded Elsewhere:** Congenital hypoplastic anaemia (KA8C)  
Noonan syndrome (LD2F.15)

**3A70.1****Acquired aplastic anaemias**

A condition occurring secondary to other disorders or via an auto-immune response directed to the bone marrow arising after birth. This disease is characterised by an almost complete absence of hematopoietic stem cells resulting in low levels of red and white blood cells and platelets. This condition may present with fatigue, chronic infections, dizziness, weakness, headaches, and episodes of bleeding, usually in the skin and mucous membranes.

**Inclusions:** Acquired medullar aplasia

**Coded Elsewhere:** Paroxysmal nocturnal haemoglobinuria (3A21.0)  
Myelofibrosis with myeloid metaplasia (2A20.2)

**3A70.10****Drug-induced aplastic anaemia**

A disease caused by drug intake. This disease is characterised by inability of stem cells to generate new mature cells leading to low levels of red blood cells, white blood cells, platelets. This disease may present with pallor, fatigue, dizziness, increased risk of infection or increased bruising/bleeding.

**3A70.11****Aplastic anaemia due to other external agents****3A70.12****Idiopathic aplastic anaemia****3A70.1Y****Other specified acquired aplastic anaemias****3A70.1Z****Acquired aplastic anaemias, unspecified****3A70.Z****Aplastic anaemia, unspecified**

**3A71****Anaemia due to chronic disease**

A disease caused by chronic diseases such as chronic infection. This disease is characterised by inflammatory responses targeted at red blood cells leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample.

**Coding Note:** Code also the causing condition

**3A71.0****Anaemia in neoplastic disease**

A disease caused by chronic neoplastic diseases. This disease is characterised by inflammatory responses targeted at red blood cell leading to low levels of red blood cells in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample

**Coding Note:** Code also the causing condition

**3A71.1****Anaemia in chronic infectious diseases**

A disease caused by chronic infectious diseases leading to decreased levels of red blood cells in the blood. This disease is characterised by a low red blood cell count in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low red blood cell count in a blood sample.

**Coding Note:** Code also the causing condition

**3A71.2****Anaemia in chronic kidney disease**

A disease caused by chronic kidney disease. This disease is characterised by a low red blood cell count in the blood. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of a low red blood cell count in a blood sample.

**Coding Note:** Code also the causing condition

**3A71.Y****Anaemia due to other specified chronic disease**

**Coding Note:** Code also the causing condition

**3A71.Z****Anaemia due to chronic disease, unspecified****3A72****Sideroblastic anaemia**

Sideroblastic anaemias are a group of disorders in which haemoglobin is insufficiently synthesized, because of defective use of iron (although plasmatic iron levels may be normal or elevated). They are said to be sideroblastic because of the presence of ringed sideroblasts in the blood due to accumulated ferritin in mitochondria. Anaemias may be microcytic hypochrome (in thalassemia and hereditary sideroblastic anaemias), or macrocytic (in idiopathic acquired sideroblastic anaemias).

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>3A73</b>    | <b>Congenital dyserythropoietic anaemia</b><br>Congenital dyserythropoietic anaemias (CDA) result from diverse erythropoietic disorders; they lead to the defective production of red blood cells (RBC) and often mild haemolysis that attests to a qualitative defect of these RBC released into the circulation. Three forms of CDA have been characterised: types I, II and III. The shared symptoms include anaemia of variable severity, intermittent jaundice, splenomegaly and hepatomegaly.<br><b>Exclusions:</b> Blackfan-Diamond syndrome (3A60.1)<br>Di Guglielmo disease (2A60.35)                                                                                          |

Polycythaemia (3A80-3A8Z)

**Coded Elsewhere:** Polycythaemia vera (2A20.4)

Polycythaemia neonatorum (KA8A)

**3A80**

**Congenital polycythaemia**

A disease caused by determinants occurring in the antenatal period leading to changes in the concentration of red blood cells. This disease is characterised by having a high concentration of red blood cells in the body leading to slow flow of blood. This disease may present with headaches, blurred vision, red skin, tiredness, high blood pressure, dizziness, periods of confusion, bleeding problems, gout or itchy skin. Confirmation is by identification of increased levels of red blood cells in a blood sample.

**Coded Elsewhere:** Polycythaemia neonatorum (KA8A)

**3A80.0**

**Primary inherited erythrocytosis**

A disease caused by genetically inherited factors leading to changes in the concentration of red blood cells. This disease is characterised by having a high concentration of red blood cells in the body leading to slow flow of blood. Confirmation is by identification of mutations by genetic testing.

**3A80.Y**

**Other specified congenital polycythaemia**

**3A80.Z**

**Congenital polycythaemia, unspecified**

**3A81**

**Acquired polycythaemia**

Secondary polycythaemia is acquired and caused by either natural or artificial increases in the production of erythropoietin, hence an increased production of erythrocytes.

**3A81.0**

**Polycythaemia due to hypoxia, including high altitude**

**3A81.1**

**Polycythaemia due to over-transfusion or blood doping**

**3A81.2**

**Relative polycythaemia**

A disease caused by loss of body fluids leading to apparent increased levels of red blood cells in the blood. This disease may present with headache, vertigo, abnormally enlarged spleen or liver, high blood pressure, or formation of blood clots. Confirmation is by identification of relative blood cell counts in a blood sample.

**3A81.Y**

**Other specified acquired polycythaemia**

**3A81.Z**

**Acquired polycythaemia, unspecified**

**3A8Z**

**Polycythaemia, unspecified**

**3A90**

**Anaemia due to acute disease**

**Exclusions:** Acute posthaemorrhagic anaemia (3A94)

**3A91**

**Congenital methaemoglobinaemia**

A disease caused by determinants in the antenatal period leading to lack of the enzyme cytochrome b5 reductase. This disease is characterised by elevated levels of methemoglobin within the blood leading to haemoglobin ineffectively releasing oxygen to body tissues. This disease may present with shortness of breath, cyanosis, headache, fatigue, exercise intolerance, dizziness and loss of consciousness. Confirmation is by identification of mutation by genetic testing.

**3A92**

**Hereditary methaemoglobinaemia**

Hereditary methemoglobinemia (HM) is a rare red cell disorder classified principally into two clinical phenotypes: autosomal recessive congenital (or hereditary) methemoglobinemia types I and II (RCM/RHM type 1; RCM/RHM type 2). In RCM type 1, well-tolerated cyanosis from birth is the only symptom. RCM type 2, with global loss of Cb5R function, is much more severe; the cyanosis is accompanied by neurological dysfunction (with intellectual deficit, microcephaly, growth retardation, opisthotonus, strabismus and hypertonia), which usually becomes evident during the first four months of life.

**3A93**

**Acquired methaemoglobinaemia**

**3A94**

**Acute posthaemorrhagic anaemia**

A disease caused by blood loss such as subsequent to trauma. This disease is characterised by loss of blood from the body leading to low levels of red blood cells/blood in the body. This disease may present with pallor, fatigue, or shortness of breath. Confirmation is by identification of low levels of red blood cells in a blood sample.

**Exclusions:** congenital anaemia from fetal blood loss (KA8C)  
Anaemia due to acute disease (3A90)

**3A9Y**

**Other specified anaemias or erythrocyte disorders**

**3A9Z**

**Anaemias or other erythrocyte disorders, unspecified**

## Coagulation defects, purpura or other haemorrhagic or related conditions (3B10-3B6Z)

A condition caused by determinants arising during the antenatal period, after birth or by genetically inherited factors, leading to coagulation defects. This condition is characterised by increased bruising and bleeding.

**Exclusions:** Postpartum coagulation defects (JA43.3)

Coagulation defects (3B10-3B4Z)

## Congenital or constitutional haemorrhagic condition (3B10-3B1Z)

A condition caused by determinants arising during the antenatal period or genetically inherited factors, leading to defects in clotting mechanisms or abnormalities causing structural flaws in the blood vessels. This disease is characterised by spontaneous bleeding or bruising.

**Coded Elsewhere:** Congenital non-inherited haemorrhagic condition

### 3B10

#### Hereditary factor VIII deficiency

A disease caused by a genetically inherited mutation leading to a deficiency in clotting due to lack of factor VIII. This disease is characterised by increasing haemorrhaging and bruising. Confirmation is by identification of mutations by genetic testing.

#### 3B10.0

##### Haemophilia A

Haemophilia A is the most common form of haemophilia characterised by spontaneous or prolonged haemorrhages due to factor VIII deficiency. Depending on the extent of the factor VIII deficiency, it can be severe (biological activity of factor VIII below 1%), moderately severe (activity of factor VIII between 1% and 5%), or mild (activity of factor VIII between 5 and 40%).

**Exclusions:** factor VIII deficiency with vascular defect (3B12)

#### 3B10.1

##### Hereditary factor VIII deficiency with anti-factor VIII inhibitor

A disease caused by a genetically inherited mutation leading to a deficiency in clotting due to lack of factor VIII. This disease also causes anti-factor VIII inhibitor antibodies to be produced when receiving transfusions. Anti-factor VIII inhibitor antibodies develop as the body recognises the factor VIII as foreign, therefore deeming factor VIII infusions ineffective. This disease is characterised by increasing haemorrhaging and bruising. Confirmation is by identification of mutations by genetic testing.

#### 3B10.Y

##### Other specified hereditary factor VIII deficiency

#### 3B10.Z

##### Hereditary factor VIII deficiency, unspecified

### 3B11

#### Hereditary factor IX deficiency

A disease caused by a genetically inherited X-linked recessive trait leading to a defective gene located on the X chromosome. This disease is characterised by low levels of the protein factor IX in the body leading to increased haemorrhaging and bruising due to clotting abnormalities. Confirmation is by identification of recessive trait by genetic testing.

Confirmation is by identification of mutation through genetic testing.<br><i>Inclusions:</i> Factor VIII deficiency with vascular defect<br>Vascular haemophilia<br>Angiohaemophilia<br><i>Exclusions:</i> factor VIII deficiency with functional defect (3B10)<br>factor VIII deficiency NOS (3B10)<br>Acquired von Willebrand disease or syndrome (3B20-3B2Y) |
| <b>3B13</b>   | <b>Haemophilia C</b><br>A disease caused by genetically inherited mutations. This disease is characterised by decreased levels of factor XI leading to abnormalities in coagulation of the blood. This disease may present with prolonged bleeding, easy bruising or bleeding gums. Confirmation is by identification of mutation through genetic testing.                                                                                                                                                                                                                                                                                                                                             |
| <b>3B14</b>   | <b>Other inherited coagulation factor deficiency with bleeding tendency</b><br>Any disease caused by genetically inherited mutations leading to lack of coagulation factors in the blood not elsewhere classified. These diseases are characterised by increased haemorrhaging and bruising as the blood cannot clot properly to control bleeding. Confirmation is identification of mutations by genetic testing.                                                                                                                                                                                                                                                                                     |
| <b>3B14.0</b> | <b>Hereditary deficiency of factor I</b><br>Congenital deficiencies of fibrinogen are coagulation disorders characterised by bleeding symptoms ranging from mild to severe resulting from reduced quantity and/or quality of circulating fibrinogen. Afibrinogenaemia (complete absence of fibrinogen) and hypofibrinogenaemia (reduced plasma fibrinogen concentration) correspond to quantitative anomalies of fibrinogen while dysfibrinogenaemia corresponds to a functional anomaly of fibrinogen. Hypo- and dysfibrinogenaemia may be frequently combined (hypodysfibrinogenaemia).                                                                                                              |

- 3B14.1 Hereditary factor X deficiency**  
 Congenital factor X deficiency is an inherited bleeding disorder with a decreased antigen and/or activity of factor X (FX) and characterised by mild to severe bleeding symptoms.
- 3B14.2 Combined deficiency of vitamin K-dependent clotting factors**  
 Hereditary combined vitamin K-dependent clotting factors deficiency (VKCFD) is a congenital bleeding disorder resulting from variably decreased levels of coagulation factors II, VII, IX and X, as well as natural anticoagulants protein C, protein S and protein Z.
- 3B14.Z Other inherited coagulation factor deficiency with bleeding tendency, unspecified**
- 3B15 Inherited coagulation factor deficiency without bleeding tendency**  
 A disease caused by a genetically inherited mutation leading to decreased levels of coagulation factor. This disease is characterised by decreased levels of coagulation factor without leading to increased haemorrhaging. Confirmation is by identification of decreased levels of coagulation factor in a blood sample.
- 3B1Z Congenital or constitutional haemorrhagic condition, unspecified**

## Haemorrhagic diseases due to acquired coagulation factor defects (3B20-3B2Y)

Any disease caused by determinants arising after birth. These diseases are characterised by abnormal coagulation of the blood.

**Exclusions:** vitamin K deficiency of newborn (KA8F.0)

- 3B20 Disseminated intravascular coagulation**  
 A disorder that is characterised by the systemic intravascular activation of the coagulation system, simultaneously leading to intravascular thrombi, compromising an adequate blood supply to the organs, and to bleeding as the consequence of consumption of platelets and coagulation factors. It may be provoked by a wide range of disorders including infections, inflammatory disorders and malignancy.
- Coded Elsewhere:** Disseminated intravascular coagulation of fetus or newborn (KA88)

- 3B21 Haemorrhagic disorder due to circulating anticoagulants and coagulation factors**  
 A disease caused by anticoagulants present in the body that prevent the blood from clotting normally. This disease is characterised by abnormalities in blood clotting. This disease may present with prolonged bleeding, easy bruising or bleeding gums. Confirmation is by identification of anticoagulants present in a blood sample.
- Exclusions:** long-term use of anticoagulants without haemorrhage (QC48.0)

|               |                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>3B21.0</b> | <b>Haemorrhage due to thrombin inhibitor other than heparin</b><br>A disease caused by any thrombin inhibitors other than heparin that affects normal coagulation of the blood. This disease is characterised by inability of the blood to coagulate leading to bleeding. Confirmation is by identification of thrombin inhibitors in a blood sample. |
| <b>3B21.1</b> | <b>Haemorrhage due to factor Xa inhibitor</b><br>A disease caused by factor Xa inhibitor that affects normal coagulation of the blood. This disease is characterised by inability of the blood to coagulate leading to bleeding. Confirmation is by identification of factor Xa inhibitor in a blood sample.                                          |

| <b>3B4Z</b>   | <b>Coagulation defects, unspecified</b>                                                                                                                                                                                                                                                                                                               |

#### Fibrinolytic defects (3B50-3B51)

A disease caused by determinants arising during the antenatal period, after birth or genetically inherited factors, affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>3B50.1</b> | <b>Congenital plasminogen activator inhibitor type 1 deficiency</b><br>Congenital plasminogen activator inhibitor type 1 (PAI-1) deficiency is a disorder that causes premature lysis of haemostatic clots and a moderate bleeding syndrome. Spontaneous bleeding is rarely observed, whereas moderate haemorrhages of the knees, elbows, nose and gingiva are usually triggered by mild trauma. However, menstrual bleeding may be severe and a prolonged bleeding after surgery is common. The PAI-1 deficiency may be qualitative or quantitative, total or partial. |

**3B50.Y**                    **Other specified inherited fibrinolytic defects**

**3B50.Z**                    **Inherited fibrinolytic defects, unspecified**

**3B51**                    **Acquired fibrinolytic defects**

A disease caused by determinants arising after birth, affecting the fibrinolysis system which prevents blood clots from growing and becoming problematic. This disease is characterised by defects in the fibrinolysis system leading to coagulation of the blood. This disease may present with thrombosis.

**3B60**                    **Non-thrombocytopenic purpura**

A descriptive term for purpura caused by determinants other than low platelet count. This should be used for coding only when a more precise diagnosis is not available.

**Exclusions:**            Antineutrophil cytoplasmic antibody-associated vasculitis (4A44.A)  
                         Antiphospholipid syndrome (4A45)  
                         Drug-associated immune complex vasculitis (4A85.03)  
                         Immune complex small vessel vasculitis (4A44.9)  
                         Leukocytoclastic vasculitis (4A44.B)  
                         Purpura or bruising due to vascular fragility (EE40.32)  
                         Thrombotic thrombocytopenic purpura (3B64.14)  
                         Traumatic purpura (EF31)

**3B60.0**                    **Hereditary vascular purpura**

**3B60.1**                    **Acquired vascular purpura**

Purpura resulting from vascular factors rather than from abnormalities in the blood such as dysproteinaemias and disorders of platelets and coagulation.

**Exclusions:**            Antineutrophil cytoplasmic antibody-associated vasculitis (4A44.A)  
                         Antiphospholipid syndrome (4A45)  
                         Capillaritis (EF40.0)  
                         Drug-associated immune complex vasculitis (4A85.03)  
                         IgA vasculitis (4A44.92)  
                         Leukocytoclastic vasculitis (4A44.B)  
                         Purpura or bruising due to vascular fragility (EE40.32)  
                         Thrombotic thrombocytopenic purpura (3B64.14)  
                         Traumatic purpura (EF31)

**3B61**                    **Thrombophilia**

A disease caused by determinants arising after birth or genetically inherited factors leading to abnormalities in blood. This disease is characterised by abnormality of blood coagulation that increases the risk of thrombosis, clots in blood vessels. This disease may present with deep vein thrombosis or pulmonary embolism. Confirmation is identification of abnormal blood coagulation in a blood sample.

**3B62.Z Qualitative platelet defects, unspecified**

**3B63 Thrombocytosis**

A disease caused by essential thrombocytosis or other myelo-proliferative disorders such as chronic myelogenous leukaemia, polycythaemia, myelofibrosis. This disease can also have secondary causes such as inflammation, surgery, hyposplenism, splenectomy, asplenia, iron deficiency anaemia or haemorrhage. This disease is characterised by elevated platelet count in the blood. Confirmation is by identification of increased platelet count in a blood sample.

**3B63.0 Congenital thrombocytosis**

Familial thrombocytosis is a type of thrombocytosis, a sustained elevation of platelet numbers, which affects the platelet/megakaryocyte lineage and may create a tendency for thrombosis and haemorrhage but does not cause myeloproliferation.

**Inclusions:** Hereditary thrombocytosis

**Exclusions:** Essential thrombocythemia (3B63.1)

**3B63.1 Acquired thrombocytosis**

A chronic myeloproliferative neoplasm that involves primarily the megakaryocytic lineage. It is characterised by sustained thrombocytosis in the blood, increased numbers of large, mature megakaryocytes in the bone marrow, and episodes of thrombosis and/or haemorrhage. Progression to a post essential thrombocythaemia myelofibrosis stage or transformation to acute myeloid leukaemia is rarely observed.

**Inclusions:** Idiopathic haemorrhagic thrombocythaemia

**3B63.10 Secondary thrombocytosis**

**Coding Note:** Code also the causing condition

**3B64 Thrombocytopenia**

This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of decreased platelet count in a blood sample.

**Coded Elsewhere:** Isolated thrombocytopenia (3B62.2)

**3B64.0 Congenital thrombocytopenia**

A disease caused by determinants arising during the antenatal period leading to low platelet count. This disease is characterised by decreased levels of platelets within the blood. This disease may present with increased bruising or haemorrhaging. Confirmation is by identification of a decreased platelet count in a blood sample.

**3B64.14** Thrombotic thrombocytopenic purpura  
This condition is idiopathic. This condition is characterised by abnormality of blood coagulation causing extensive microscopic clots to form in the small blood vessels throughout the body resulting in low platelet count. This condition may present with seizures, hemiplegia, paresthesias, visual disturbance, and aphasia or anaemia. Confirmation is by identification of thromboses.

**3B64.1Y** Other specified acquired thrombocytopenia

**3B64.Z** **Thrombocytopenia, unspecified**

**3B65** **Thrombotic microangiopathy, not elsewhere classified**  
Thrombotic microangiopathies are microvascular occlusive disorders characterised by systemic or intrarenal aggregation of platelets, thrombocytopenia, and mechanical injury to erythrocytes. Thrombotic thrombocytopenic purpura (TTP) and haemolytic–uremic syndrome (HUS) represent a spectrum of thrombotic microangiopathies. In TTP, systemic microvascular aggregation of platelets causes ischemia in the brain and other organs. In HUS, platelet–fibrin thrombi predominantly occlude the renal circulation.

**Coded Elsewhere:** Thrombotic thrombocytopenic purpura (3B64.14)

Haemolytic uraemic syndrome (3A21.2)

Methylcobalamin deficiency type cbl G (5C50.B)

Hereditary haemolytic uraemic syndrome (3A10.Y)

**3B6Z** **Coagulation defects, purpura or other haemorrhagic or related conditions, unspecified**

## Diseases of spleen (3B80-3B8Z)

**3B80** **Congenital disorders of spleen**

Any condition caused by a failure of the spleen to correctly develop in the antenatal period.

**Coded Elsewhere:** Structural developmental anomalies of spleen (LB22)

**3B80.0** **Splenomegaly in storage diseases**

A disease caused by storage diseases; genetically inherited metabolic disorders that result from defects in lysosomal, lipid or glycogen function, of the spleen. This disease is characterised by enlargement of the spleen. This disease may present with abdominal pain, chest pain, pallor, shortness of breath fatigue. Confirmation is through medical imaging.

**3B81****Acquired disorders of spleen**

Any condition caused by determinants acquired after birth, leading to dysfunction of the spleen.

**Coded Elsewhere:** Injury of spleen (NB91.0)

Malignant neoplasms of the spleen (2C11.Z)

**3B81.0****Tumour-like conditions of spleen**

Any condition caused by determinants acquired after birth, in the antenatal period or genetically inherited factors, leading to tumour-like conditions of the spleen. Confirmation is through medical imaging.

**3B81.1****Postsurgical asplenia**

A disease caused by underlying diseases, splenectomy or splenic rupture from trauma. This disease is characterised by absence of normal spleen function. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.

**3B81.2****Atrophy of spleen**

A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by partial or complete degradation of the spleen. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.

**3B81.3****Nontraumatic laceration or rupture of spleen**

A disease caused by non-traumatic determinants such as infectious diseases, medical procedures such as colonoscopy, haematological diseases, medications, or pregnancy. This disease is characterised by laceration or rupturing of the spleen leading to lack of function. This disease may present with bleeding and increased susceptibility of infection. Confirmation is through medical imaging.

**3B81.4****Splenosis**

A disease caused by determinants arising after birth such as physical trauma or splenectomy. This disease is characterised by autoimplantation of one or more focal deposits of splenic tissue in various compartments of the body. Confirmation is through medical imaging.

**3B81.5****Splenic cyst or pseudocyst****3B81.50****Pseudocyst of spleen**

A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by a noncancerous fluid-filled sac, pseudocysts are like cysts, but lack epithelial or endothelial cells. This disease is often asymptomatic but may present with abdominal pain, nausea and vomiting. Confirmation is through medical imaging.

**3B81.51****Epithelial cyst of spleen****3B81.5Y****Other specified splenic cyst****3B81.5Z****Splenic cyst, unspecified**

This disease is characterised by death of spleen tissue and loss of function. Confirmation is by medical imaging.<br><b>Exclusions:</b> traumatic rupture of spleen (NB91.0)<br><b>Coded Elsewhere:</b> Neonatal haemorrhage originating in spleen (KA83.5) |
| <b>3B81.7</b>       | <b>Infection of spleen</b><br>Any condition of the spleen, caused by an infection with a bacterial, viral, fungal, or parasitic source.                                                                                                                                                                                                                                                                                    |
| <b>3B81.70</b>      | Acute septic splenitis<br><b>Inclusions:</b> septic spleen                                                                                                                                                                                                                                                                                                                                                                 |
| <b>3B81.71</b>      | Abscess of spleen<br>This is a collection of pus (neutrophils) that has accumulated within a tissue because of an inflammatory process in response to either an infectious process (usually caused by bacteria or parasites) or other foreign materials (e.g., splinters, bullet wounds, or injecting needles), in the spleen.                                                                                             |
| <b>3B81.7Y</b>      | Other specified infection of spleen                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>3B81.7Z</b>      | Infection of spleen, unspecified                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>3B81.8</b>       | <b>Torsion of spleen</b><br>A disease caused by abnormal development of splenic suspensory ligaments. This disease is characterised by twisting of the spleen leading to splenic infarction. This disease may present with abdominal pain. Confirmation is through medical imaging.                                                                                                                                        |
| <b>3B81.9</b>       | <b>Fibrosis of spleen</b><br>A disease caused by determinants arising after birth, during the antenatal period or by genetically inherited factors. This disease is characterised by formation of excess fibrous connective tissue leading to partial or complete degradation of the spleen. This disease may present with increased susceptibility to infection. Confirmation is through medical imaging.                 |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>3B81.A</b>       | <b>Perisplenitis</b><br>A disease caused by bacterial or viral infection, parasite infestation, or cysts. This disease is characterised by inflammation of the peritoneal surface of the spleen. This disease may present with abdominal pain, susceptibility to infection and enlargement of the spleen. Confirmation is by identification of infection in a blood sample.                                                |

|               |                                                                                                                                                                                                                                                                                                                                                                                                          |

## CHAPTER 04

---

### Diseases of the immune system

This chapter has 45 four-character categories.

Code range starts with 4A00

**Exclusions:** Complications of pregnancy, childbirth and the puerperium (Chapter 18)

Neoplasms (Chapter 02)

Developmental anomalies (Chapter 20)

**Coded Elsewhere:** Organ specific autoimmune disorders

Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA10-MA3Y)

This chapter contains the following top level blocks:

- Primary immunodeficiencies
- Nonorgan specific systemic autoimmune disorders
- Autoinflammatory disorders
- Allergic or hypersensitivity conditions
- Immune system disorders involving white cell lineages
- Certain disorders involving the immune system
- Organ specific autoimmune disorders

#### Primary immunodeficiencies (4A00-4A0Z)

##### 4A00

##### **Primary immunodeficiencies due to disorders of innate immunity**

**Coded Elsewhere:** Constitutional neutropaenia (4B00.00)

##### 4A00.0

##### **Functional neutrophil defects**

**Inclusions:** Congenital dysphagocytosis

**Coded Elsewhere:** Haemolytic anaemia due to glucose-6-phosphate dehydrogenase deficiency (3A10.00)

Papillon-Lefèvre syndrome (EC20.30)

##### 4A00.00

##### **Neutrophil immunodeficiency syndrome**

Neutrophil immunodeficiency syndrome is a primary immunodeficiency characterised by neutrophilia with severe neutrophil dysfunction, leukocytosis, a predisposition to bacterial infections and poor wound healing, including an absence of pus in infected areas.

##### 4A00.0Y

##### **Other specified functional neutrophil defects**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>4A00.13</b> | Immunodeficiency with factor D anomaly<br>Factor D deficiency is an autosomal recessive immunologic disorder characterised by increased susceptibility to bacterial infections, particularly <i>Neisseria</i> infections, due to a defect in the alternative complement pathway.                                                                                                                                                                                                                                                                                                                                                             |
| <b>4A00.14</b> | Hereditary angioedema<br>Hereditary angioedema is caused in the majority of cases by genetically determined low absolute (type I) or functional (type II) levels of C1 inhibitor, a plasma proteinase inhibitor involved in regulation of complement activation. It is characterised clinically by recurrent subcutaneous and/or submucosal oedema and can result in life-threatening laryngeal obstruction. Involvement of the digestive tract commonly causes abdominal pain. This and the absence of accompanying urticarial weals or itch distinguish it from the common form of angioedema, which is part of the spectrum of urticaria. |
| <b>4A00.15</b> | Acquired angioedema<br>Acquired angioedema is clinically similar to hereditary angioedema and is not associated with urticaria. It may be associated with a lymphoproliferative disorder (type I) or may be an isolated phenomenon due to an autoantibody directed against C1 inhibitor (type II).                                                                                                                                                                                                                                                                                                                                           |

| <b>4A40.1</b>  | <p><b>Drug-induced lupus erythematosus</b></p> <p>Drug-induced lupus erythematosus is a syndrome in which positive antinuclear antibodies are associated with symptoms, such as fever, malaise, arthritis, intense arthralgia/myalgia, serositis, and/or rash. The syndrome appears during therapy with certain medications (e.g., procainamide, hydralazine, phenytoin) and tumour necrosis factor inhibitors. It occurs predominantly in Caucasians, has less female predilection than SLE, rarely involves kidneys or brain, is rarely associated with anti-dsDNA, is commonly associated with antibodies to histones, and usually resolves over several weeks after discontinuation of the offending medication.</p> |

| <b>4A41.1</b>  | <p><b>Polymyositis</b></p> <p>Polymyositis is an inflammatory muscle disease of unknown aetiology occurring predominantly in adults and characterised clinically by proximal muscle weakness (shoulders, arms, thighs), often with associated myalgia. Involvement of pharyngeal and oesophageal muscles may result in dysphagia and a risk of aspiration pneumonia. Myocarditis with rhythm disturbances or cardiomyopathy is a rare but serious complication. Polymyositis may be associated with other autoimmune diseases, malignancy or viral infection. Although serum muscle enzyme concentrations and electromyography are usually abnormal, definitive diagnosis requires demonstration of characteristic histological changes, including muscle necrosis, muscle fibre regeneration and diffuse infiltration by CD8+ T lymphocytes, on muscle biopsy.</p> |
| <b>4A41.10</b> | <p>Juvenile polymyositis</p> <p>Juvenile polymyositis is a rare childhood idiopathic inflammatory myopathy. It is frequently misdiagnosed, as it lacks a unique clinical phenotype. Traditionally, it presents with weakness of the proximal muscles that evolves over weeks to months. The primary histologic features are fibre size variability, scattered necrotic and regenerating fibres, and perivascular and endomysial cellular infiltrates.</p> <p><b>Exclusions:</b> Systemic sclerosis (4A42)<br/> Overlap or undifferentiated nonorgan specific systemic autoimmune disease (4A43)<br/> Antiphospholipid syndrome (4A45)<br/> Vasculitis (4A44)<br/> Lupus erythematosus (4A40)</p>                                                                                                                                                                    |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>4A41.2</b>       | <p><b>Inclusion body myopathy</b></p> <p>Inclusion body myopathy (IBM) is distinguished from polymyositis (PM) and dermatomyositis (DM) on the basis of clinical and histopathological features. A characteristic clinical phenotype is characterised by insidious onset of muscle weakness over months to years, muscle weakness localised predominantly in the thigh muscles and finger flexors, and resistance to glucocorticoid treatment. Typical histopathologic features include sarcoplasmic and nuclear inclusions and rimmed vacuoles.</p>                                                                                                                                                                                                                                                                                                                                                          |
| <b>4A41.20</b>      | <p>Inflammatory inclusion body myositis</p> <p>Inclusion body myositis (IBM) is the most common idiopathic inflammatory myopathy after age 50. It typically presents with chronic insidious proximal leg and/or distal arm asymmetric muscle weakness leading to recurrent falls and loss of dexterity. Creatine kinase is up to 15 times elevated in IBM and needle electromyography mostly shows a chronic irritative myopathy. Muscle histopathology demonstrates endomysial inflammatory exudates surrounding and invading non-necrotic muscle fibres often times accompanied by rimmed vacuoles and protein deposits. Despite inflammatory muscle pathology, it is likely that IBM has a prominent degenerative component as supported by refractoriness to immunosuppressive therapy.</p> <p><b>Exclusions:</b> Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)</p> |
| <b>4A41.21</b>      | <p>Noninflammatory inclusion body myopathy</p> <p>Noninflammatory inclusion body myopathy (IBM) is an idiopathic muscle disorder without inflammatory exudates and expression of class I major histocompatibility complex. Rimmed vacuoles and "IBM-like" filaments without inflammatory cells are described in muscle biopsy.</p> <p><b>Exclusions:</b> Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**4A41.Z Idiopathic inflammatory myopathy, unspecified**

**4A42 Systemic sclerosis**

Systemic sclerosis is a systemic disorder of the connective tissue; manifested by hardening and thickening of the skin, by abnormalities involving the microvasculature and larger vessels, and by fibrotic degenerative changes in various body organs including the heart, lungs, kidneys, and gastrointestinal tract.

**Inclusions:** Systemic scleroderma

**Exclusions:** Circumscribed scleroderma (EB61.0)

**4A42.0 Paediatric onset systemic sclerosis**

Systemic sclerosis arising before the age of 16. Involvement of internal organs is less common but arthritis and myositis are more common than in adults.

**4A42.1 Diffuse systemic sclerosis**

Diffuse cutaneous systemic sclerosis (dcSSc) is a subtype of Systemic Sclerosis (SSc) characterised by truncal and acral skin fibrosis with an early and significant incidence of diffuse involvement (interstitial lung disease, oliguric renal failure, diffuse gastrointestinal disease, and myocardial involvement).

**4A42.2 Limited systemic sclerosis**

Combination of calcinosis, Raynaud phenomenon, oesophageal dysfunction, sclerodactyly and telangiectasia.

**4A42.Z Systemic sclerosis, unspecified**

**4A43 Overlap or undifferentiated nonorgan specific systemic autoimmune disease**

Nonorgan specific systemic autoimmune diseases which do not fulfil the diagnostic criteria for any single recognised disease entity.

**4A43.0 IgG4 related disease**

IgG4 related syndrome (IgG4-related disease: IgG4-RD) is a clinical disease characterised by elevated serum IgG4 concentration and tumefaction or tissue infiltration by IgG4-positive plasma cells. The diagnostic criteria for IgG4 related syndrome have been proposed, and it may be present in a certain population of patients with a wide variety of diseases, including Mikulicz disease, autoimmune pancreatitis, hypophysitis, Riedel thyroiditis, interstitial pneumonitis, interstitial nephritis, prostatitis, lymphadenopathy, retroperitoneal fibrosis, inflammatory aortic aneurysm, and inflammatory pseudo tumour.

**Coded Elsewhere:** Primary cutaneous plasmacytosis (EK91.2)

Benign dermal lymphocytic or lymphoplasmacytic infiltrations  
or proliferations (EE90-EE91)

Type 1 IgG4 related autoimmune pancreatitis (DC33)

| <b>4A43.1</b>       | <p><b>Mikulicz disease</b></p> <p>Mikulicz disease is a disorder first reported by Johann von Mikulicz in 1892 and characterised by symmetrical swelling of the lachrymal, submandibular, and parotid glands, with massive infiltration of these glands by mononuclear cells. Serum autoantibodies, such as anti-Ro/SS-A, are usually negative and serum IgG4 concentration may be increased. Unlike Sjögren disease, IgG4-Mikulicz disease is characterised by the formation of lymphoid follicles, but shows lower levels of lymphocytic infiltration into salivary ducts, such that their structure remains intact.</p>         |
| <b>4A43.2</b>       | <p><b>Sjögren syndrome</b></p> <p>Sjögren syndrome is a slowly progressive, systemic inflammatory autoimmune disease affecting primarily the exocrine glands. Lymphocytic infiltrates replace functional epithelium, leading to oral and ocular dryness. Characteristic autoantibodies (e.g., anti-Ro/SS-A and/or anti-La/SS-B) are produced. The disorder can occur alone (it is then known as “primary SS”) or in association with another autoimmune disease (it is then known as “secondary SS”).</p> <p><b>Coded Elsewhere:</b> Keratoconjunctivitis sicca (9A79)</p>                                                         |
| <b>4A43.20</b>      | Primary Sjögren syndrome                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>4A43.21</b>      | <p>Secondary Sjögren syndrome</p> <p>Secondary Sjögren syndrome is a progressive inflammatory autoimmune disease affecting the exocrine glands in the presence of other systemic autoimmune diseases, such as rheumatoid arthritis, systemic lupus erythematosus, and systemic sclerosis. Lymphocytic infiltrates replace functional epithelium, leading to oral and ocular dryness.</p>                                                                                                                                                                                                                                           |

| <b>4A43.3</b>       | <p><b>Mixed connective tissue disease</b></p> <p>Mixed connective tissue disease is an overlapping syndrome combining features of systemic lupus erythematosus, systemic sclerosis, and polymyositis with the presence of autoantibodies to U1-ribonucleoprotein. Raynaud’s phenomenon is seen in nearly all patients and pulmonary arterial hypertension is the most common cause of death in MCTD patients.</p>                                                                                                                                                                                                                  |
| <b>4A43.4</b>       | <p><b>Diffuse eosinophilic fasciitis</b></p> <p>Also called Shulman disease/diffuse fasciitis, diffuse eosinophilic fasciitis is a rare idiopathic disorder associated with induration of the skin (orange-peel sign) that generally develops rapidly. It is a dermal and hypodermal sclerosis associated with fibrotic thickening of the subcutaneous adipose lobular septa, superficial fascia, and perimysium. Full thickness excisional biopsy of skin lesions revealing fibrosis of the subcutaneous fascia is generally required for diagnosis. Onset follows unusual physical exertion and trauma, especially in males.</p> |
| <b>4A43.Y</b>       | <b>Other specified overlap non-organ specific systemic autoimmune disease</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**4A43.Z****Undifferentiated non-organ specific systemic autoimmune disease****4A44****Vasculitis**

Vasculitides represent a heterogeneous group of diseases of multifactorial aetiology characterised by inflammatory lesions of vessels. These lesions consist of fibrinoid necrosis (necrotizing arteritis), giant cell infiltration without necrosis, immunoglobulins deposit or leukocytoclastic infiltration. The spectrum and severity of the systemic vasculitides is broad, from life or sight threatening fulminant disease to relatively minor skin disease.

**Coded Elsewhere:** Behçet disease (4A62)

Thrombotic microangiopathy, not elsewhere classified (3B65)

**4A44.0****Rhizomelic pseudopolyarthritis****4A44.1****Aortic arch syndrome**

Arteritis, often granulomatous, predominantly affecting the aorta and/or its major branches. Onset usually in patients younger than 50.

**4A44.2****Giant cell arteritis**

Arteritis, often granulomatous, usually affecting the aorta and/or its major branches, with a predilection for the branches of the carotid artery. Often involves the temporal artery. Onset usually in patients older than 50 and often associated with polymyalgia rheumatica.

**4A44.3****Single organ vasculitis**

Vasculitis in arteries or veins of any size in a single organ that has no features that indicate that it is a limited expression of a systemic vasculitis. The involved organ and vessel type should be included in the name (e.g. cutaneous SVV, testicular arteritis, central nervous system vasculitis). Vasculitis distribution may be unifocal or multifocal (diffuse) within an organ. Some patients originally diagnosed with SOV will develop additional disease manifestations that warrant re-defining the case as one of the systemic vasculitides (e.g. cutaneous arteritis later becoming systemic polyarteritis nodosa, etc.).

**4A44.4****Polyarteritis nodosa**

Polyarteritis nodosa is an immunologically mediated systemic necrotising vasculitis affecting medium-sized vessels. In a few cases, the disease appears after viral infection but in the majority of cases there is no known triggering event. The clinical manifestations involve numerous organs and lead to a general alteration in the health status including rapid weight loss, paralysis of the peripheral nerves, renal disease, and digestive problems such as haemorrhages, perforation, appendicitis and pancreatitis. Arthralgia is almost always present and myalgia occurs in half of patients. Cardiac and cerebral anomalies (cephalalgia) are also reported, as well as ocular and genital (orchitis) manifestations.

- 4A44.5 Mucocutaneous lymph node syndrome**  
Mucocutaneous lymph node syndrome (Kawasaki disease) is a globally distributed acute vasculitis of young children affecting medium to small calibre arteries and if untreated leads to coronary artery aneurysms in about a quarter of cases. Cardinal signs include cervical lymphadenopathy, conjunctival injection, rash (maculopapular, erythrodermic or erythema multiforme-like), strawberry tongue, oropharyngeal erythema, erythema and swelling of hands and feet and periungual desquamation. The cause is unknown but thought to be environmental, possibly from viral infection. A variant of the disease has been linked to SARS CoV-2 infection.
- Inclusions:** Kawasaki syndrome
- 4A44.6 Sneddon syndrome**  
Sneddon syndrome associates livedo reticularis and neurological signs. Livedo is permanent, cyanotic, with no infiltration, and affects the limbs, trunk and sometimes the face. Neurological signs appear later and include cerebrovascular accidents, epilepsy, vertigo and more rarely a pseudobulbar syndrome, chorea, episodes of amnesia or transient amaurosis.
- 4A44.7 Primary angiitis of the central nervous system**  
In primary angiitis of the central nervous system, vasculitis is limited to the central nervous system. Primary angiitis of the central nervous system is a very rare disease, and its manifestation can be mimicked by many other diseases. Patients with primary angiitis commonly show headache, waxing and waning altered mental status, and transient ischemic attack-like events. Diagnosis is often based on angiography, although brain biopsy remains the only definitive diagnostic test.
- 4A44.8 Thromboangiitis obliterans**  
Thromboangiitis obliterans (TAO), or Buerger's disease, is a segmental occlusive inflammatory condition of arteries and veins, with thrombosis and recanalization of the affected vessels. It is a nonatherosclerotic inflammatory disease affecting small and medium sized arteries and veins of upper and lower extremities. TAO can be distinguished from other types of vasculitis based on its tendency to occur in young male subjects. The etiology and pathogenesis of TAO remains unknown; however, tobacco consumption plays a key role in the initiation and persistence of the disease.
- 4A44.9 Immune complex small vessel vasculitis**  
**Coded Elsewhere:** Anti-glomerular basement membrane antibody mediated disease (MF85)  
Susac syndrome (8A45.2Y)
- 4A44.90 Cryoglobulinaemic vasculitis**  
Vasculitis with cryoglobulin immune deposits affecting small vessels (predominantly capillaries, venules, or arterioles) and associated with cryoglobulins in serum. Skin and glomeruli are often involved.

| <b>4A44.B</b>       | <b>Leukocytoclastic vasculitis</b><br>Leukocytoclastic vasculitis (hypersensitivity vasculitis; hypersensitivity angiitis) is a histopathological term commonly used to denote a small-vessel vasculitis. It may be localised to the skin or may manifest in other organs. The internal organs affected most commonly include the joints, the gastrointestinal tract, and the kidneys. The prognosis is good in the absence of internal involvement. Leukocytoclastic vasculitis has many causes including infections, drugs and systemic autoimmune diseases but no cause is identified in up to 50% of patients with this condition. |

| <b>4A60.0</b> | <b>Familial Mediterranean fever</b>                                                                                                                                                                                                                                                                                                                                                                                                                      |
|               | FMF is an autoinflammatory disease associated with mutations in pyrin resulting in enhanced IL1 beta production. This results in clinical attacks of inflammation in the form of fever and serositis in the form of peritoneal, pleural or synovial inflammation along with increased acute phase reactants.                                                                                                                                             |
| <b>4A60.1</b> | <b>Cryopyrin-associated periodic syndromes</b>                                                                                                                                                                                                                                                                                                                                                                                                           |
|               | CAPS is an autoinflammatory disease associated with gain of function changes in the cryopyrin protein, resulting in inflammasome activation and enhanced IL1 beta production. This results in clinical signs and symptoms of inflammation in the form of rash, fever, joint and eye symptoms with increased acute phase reactants.                                                                                                                       |
|               | <b>Inclusions:</b> Cryopyrinopathies                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>4A60.2</b> | <b>Tumour necrosis factor receptor 1 associated periodic syndrome</b>                                                                                                                                                                                                                                                                                                                                                                                    |
|               | TRAPS is an autoinflammatory disease associated with heterozygous mutations in the gene coding for tumour necrosis factor (TNF) receptor 1 (TNFR1). This results in clinical attacks of inflammation in the form of fever and serositis in the form of peritoneal, pleural or synovial inflammation along with increased acute phase reactants.                                                                                                          |

|               | Behçet disease is a disease of incompletely understood aetiopathogenesis characterised by recurrent oral and/or genital aphthous ulcers accompanied by cutaneous, ocular, articular, gastrointestinal, and/or central nervous system inflammatory lesions. Small vessel vasculitis, thrombotic vasculopathy, arteritis and arterial aneurysms may occur. It has a high prevalence from the Eastern Mediterranean across Central Asia to China and Japan. |

## Allergic or hypersensitivity conditions (4A80-4A8Z)

Allergy is a hypersensitivity reaction initiated by proven immunologic mechanisms.

Hypersensitivity is defined as conditions clinically resembling allergy that cause objectively reproducible symptoms or signs, initiated by exposure to a defined stimulus at a dose tolerated by normal subjects.

**Coded Elsewhere:** Eosinophilia (4B03)

Hypersensitivity reactions of unspecified nature (4B07)

### 4A80

#### **Allergic or hypersensitivity disorders involving the respiratory tract**

Allergic or hypersensitivity disorders involving the respiratory tract includes several clinically different conditions that can be considered as hypersensitivity disorders of the upper and lower respiratory tract. The classification of these conditions is complex.

**Coded Elsewhere:** Vasomotor or allergic rhinitis (CA08)

Aspergillus-induced allergic or hypersensitivity conditions (CA82.4)

Chronic rhinosinusitis (CA0A)

Asthma (CA23)

Nasal polyp (CA0J)

Hypersensitivity pneumonitis due to organic dust (CA70)

### 4A80.0

#### **Drug-induced bronchospasm**

Drug-induced bronchospasm is a common clinical manifestation triggered by various drugs. It ranges in severity from mild to severe, and even fatal from post-anoxic brain damage. It can be manifested as an isolated event or in combination with other symptoms as representation of drug-induced anaphylaxis.

### 4A80.1

#### **Bronchospasm provoked by allergy to food substance**

Bronchospasm provoked by allergy to food allergens is clinical manifestation triggered by various foods as a phenotype of food hypersensitivity. It is more frequent in the youngest atopic patients and the most common foods responsible for these reactions are cow milk, peanut, egg and tree nuts. This clinical presentation can be manifested as an isolated event or in combination with other symptoms as representation of drug-induced anaphylaxis.

### 4A80.Y

#### **Other specified allergic or hypersensitivity disorders involving the respiratory tract**

### 4A80.Z

#### **Allergic or hypersensitivity disorders involving the respiratory tract, unspecified**

**4A81****Allergic or hypersensitivity disorders involving the eye**

Allergic or hypersensitivity disorders involving the eye includes several clinically different conditions that can be considered as hypersensitivity disorders of the ocular surface. The classification of these conditions is complex.

**Coded Elsewhere:** Allergic conjunctivitis (9A60.02)

Vernal keratoconjunctivitis (9A60.5)

Giant papillary conjunctivitis (9A60.00)

Irritant contact blepharoconjunctivitis (EK02.11)

Acute atopic conjunctivitis (9A60.01)

Allergic contact blepharoconjunctivitis (9A06.72)

Atopic keratoconjunctivitis (9A60.0Y)

Vernal conjunctivitis (9A60.0Y)

**4A82****Allergic or hypersensitivity disorders involving skin or mucous membranes**

Allergic or hypersensitivity disorders involving the skin and mucous includes a heterogeneous group of disorders involving skin and mucous membranes in which either allergy or hypersensitivity play a part.

**Coded Elsewhere:** Allergic contact dermatitis (EK00)

Photo-allergic contact dermatitis (EK01)

Allergic contact urticaria (EK10)

Protein contact dermatitis (EK11)

Allergic contact sensitisation (EK12)

Urticaria, angioedema and other urticarial disorders (EB00-EB0Y)

Atopic eczema (EA80)

Allergy to substances in contact with the skin (EK5Y)

**4A83****Allergic or hypersensitivity disorders involving the gastrointestinal tract**

**Coded Elsewhere:** Allergic gastritis (DA42.4)

Allergic duodenitis (DA51.3)

Allergic or dietetic colitis (DB33.2)

Allergic or dietetic enteritis of small intestine (DA94.2)

**4A83.0****Food-induced eosinophilic gastroenteritis**

A disease characterised by eosinophilic infiltration of various layers of stomach and intestine induced by specific food intake in the absence of any known cause of eosinophilia. It can occur in any age and the symptoms vary depending on the site of the intestinal tract involved and degree of eosinophilic inflammation, might include ascites, weight loss, oedema, obstruction.

- 4A83.1 Food-induced eosinophilic oesophagitis**  
A chronic, immune or antigen-mediated oesophageal disease characterised by eosinophilic infiltration of oesophageal wall induced by specific food intake in the absence of any known cause of eosinophilia. The symptoms are related to oesophageal dysfunction, including feeding disorders, reflux symptoms, vomiting, dysphagia, and food impaction.
- 4A83.Y Other specified allergic or hypersensitivity disorders involving the gastrointestinal tract**
- 4A83.Z Allergic or hypersensitivity disorders involving the gastrointestinal tract, unspecified**
- 4A84 Anaphylaxis**  
Anaphylaxis is a severe, life-threatening systemic hypersensitivity reaction characterised by being rapid in onset with potentially life-threatening airway, breathing, or circulatory problems and is usually, although not always, associated with skin and mucosal changes.
- 4A84.0 Anaphylaxis due to allergic reaction to food**  
Rapidly progressive, multi-system and potentially life-threatening reaction to exposure to a food allergen to which the affected individual has previously been sensitized.  
**Exclusions:** obstruction from food aspiration (ND72)  
food intolerance (DA96.02)
- 4A84.1 Drug-induced anaphylaxis**  
Anaphylaxis attributable to a drug. When severe it may be fatal. This systemic reaction usually develops within minutes to hours of administration of the drug, is often severe and may be fatal. The most frequent drugs causing anaphylaxis are antibiotics, particularly penicillins. Clinically there may be premonitory dizziness or faintness, skin tingling and erythema, followed by urticaria, angio-oedema, bronchospasm, abdominal pain and vasomotor collapse.  
**Coded Elsewhere:** Anaphylaxis due to radiocontrast media (EL80)
- 4A84.2 Anaphylaxis due to insect venom**  
Anaphylaxis due to insect venom is a severe systemic hypersensitivity reaction with rapid onset of cutaneous, vascular or respiratory symptoms and signs, either singly or in any combination after exposure (mainly by sting) to an insect venom in a sensitized patient.  
**Exclusions:** Harmful effects of or exposure to noxious substances,  
Substances chiefly nonmedicinal as to source, Venoms  
or toxins (NE61)
- 4A84.3 Anaphylaxis provoked by physical factors**  
Anaphylaxis provoked by physical factors covers a group of anaphylaxis phenotypes in which physical factors are the main triggers. The most relevant are: exercise-induced anaphylaxis, exercise-induced anaphylaxis dependent on food, cold-induced anaphylaxis.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>4A84.30</b> | <p>Exercise-induced anaphylaxis</p> <p>Exercise-induced anaphylaxis is disorder in which anaphylaxis occurs after physical activity. The clinical features may include pruritus, urticarial weals, flushing, wheezing, and gastrointestinal disturbance including nausea, abdominal cramping, and diarrhoea. If physical activity continues, angioedema, laryngeal oedema, hypotension, and, ultimately, cardiovascular collapse may occur. Exercise-induced anaphylaxis is most commonly associated with IgE-mediated allergy to food whereby anaphylaxis occurs only if ingestion is followed temporally by exercise. Cessation of physical activity usually results in immediate improvement of symptoms.</p> |
| <b>4A84.31</b> | <p>Cold-induced anaphylaxis</p> <p>Cold-induced anaphylaxis is triggered by skin cooling. The deaths are directly caused by the anaphylactic reaction due to drowning when swimming in cold water.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**4A85.0****Drug or pharmacological agents hypersensitivity**

Drug hypersensitivity reactions are the adverse effects of pharmaceutical formulations (including active drugs and excipients) that clinically resemble allergy. It belongs to type B adverse drug reactions, which are defined by the World Health Organization as the dose-independent, unpredictable, noxious, and unintended response to a drug taken at a dose normally used in humans. It covers many different clinical phenotypes with variable onset and severity.

**Coded Elsewhere:** Drug eruptions (EH60-EH6Z)

Drug-induced bronchospasm (4A80.0)

Drug-induced aplastic anaemia (3A70.10)

Aspirin-induced asthma (CA23.20)

Samter syndrome (CA0A.0)

Photoallergic drug reaction (EH75)

Pseudolymphomatous drug hypersensitivity syndrome (EH6Y)

Anaphylaxis due to radiocontrast media (EL80)

**4A85.00****Drug-induced liver hypersensitivity disease**

Drug-induced liver hypersensitivity disease is a relatively rare condition, but can have serious consequences for the individual patient, public health, regulatory agencies and the pharmaceutical industry. It is characterised by elevation in serum alanine-aminotransferase (ALT), conjugated bilirubin, or combined bilirubin, ALT and alkaline phosphatase (AP) levels > 2 times the upper limit of normal (ULN) and the most frequent related drugs are halothane, tienilic acid, dihydralazine, diclofenac, and carbamazepine.

**4A85.01****Drug-induced kidney hypersensitivity**

Drug-induced kidney hypersensitivity constitutes an important cause of acute renal failure and chronic kidney disease in present day clinical practice. Different classes of drugs, by virtue of immunological mechanisms, initiate specific inflammatory renal responses, which are manifested by different clinical patterns, such as drug-induced interstitial nephritis. The drug-induced kidney hypersensitivity can manifest alone or in combination with other drug-induced organ or system hypersensitivity disorders.

**Coded Elsewhere:** Acute renal papillary necrosis due to drugs, biological agents or environmental toxins (GB53)

**4A85.02****Drug-induced cytopenia**

Drug-induced cytopenia is a relatively common immune-mediated cytopenia and the target cells include erythrocytes, leukocytes, platelets and hematopoietic precursor cells in the marrow. The most frequent condition is the drug-induced immune thrombocytopenia and the most frequent implicated drugs are penicillin and structurally related drugs, quinine, quinidine, sulfonamide antibiotics, non-steroidal anti-inflammatory drugs and anticonvulsants.

**Coded Elsewhere:** Drug-induced immune thrombocytopenia (3B64.12)

Drug-induced secondary agranulocytosis (4B00.01)

## Immune system disorders involving white cell lineages (4B00-4B0Z)

**Coded Elsewhere:** Immunodeficiencies with predominantly antibody defects (4A01.0)

Combined immunodeficiencies (4A01.1)

Defects in the complement system (4A00.1)

Diseases of immune dysregulation (4A01.2)

Other well-defined immunodeficiency syndromes due to defects in adaptive immunity (4A01.3)

### **4B00 Disorders of neutrophil number**

**Exclusions:** Decreased white blood cell count (MA16.10)

#### **4B00.0 Neutropaenia**

**Coded Elsewhere:** Transient neonatal neutropaenia (KA8D)

Alloimmune neonatal neutropaenia (KA8E)

#### **4B00.00 Constitutional neutropaenia**

This is a granulocyte disorder characterised by an abnormally low number of neutrophils. Neutrophils usually make up 50-70% of circulating white blood cells and serve as the primary defence against infections by destroying bacteria in the blood.

**Exclusions:** Cartilage-hair hypoplasia (LD27.0)

#### **4B00.01 Acquired neutropaenia**

#### **4B00.0Z Neutropaenia, unspecified**

#### **4B00.1 Neutrophilia**

#### **4B00.10 Constitutional neutrophilia**

#### **4B00.11 Acquired neutrophilia**

**Coding Note:** Code also the causing condition

**Exclusions:** Non mast cell myeloproliferative neoplasms (2A20)

#### **4B00.1Z Neutrophilia, unspecified**

#### **4B00.Y Other specified disorders of neutrophil number**

### **4B01 Disorders of neutrophil function**

**Coded Elsewhere:** Functional neutrophil defects (4A00.0)

#### **4B01.0 Constitutional disorders of neutrophil function**

#### **4B01.00 Disorders of neutrophil adhesion**

## Certain disorders involving the immune system (4B20-4B2Y)

Disorders in which disturbed immune regulation plays an important part but which cannot be more precisely located elsewhere in the classification.

**Exclusions:** Failure or rejection of transplanted organs or tissues (NE84)  
Monoclonal gammopathy of undetermined significance (2A83.0)

**Coded Elsewhere:** Hereditary angioedema (4A00.14)

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>4B20</b>   | <b>Sarcoidosis</b><br>Sarcoidosis is a multisystem disorder of unknown cause characterised by the formation of immune granulomas in involved organs. The lung and the lymphatic system are predominantly affected, but virtually every organ may be involved. Other severe manifestations result from cardiac, neurological, ocular, kidney or laryngeal localizations.                                                              |
| <b>4B20.0</b> | <b>Sarcoidosis of lung</b>                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>4B20.1</b> | <b>Sarcoidosis of lymph nodes</b><br>Lymphadenopathy is very common in sarcoidosis. Intrathoracic nodes are enlarged in 75 to 90% of all patients; usually this involves the hilar nodes, but the paratracheal nodes are commonly involved. Peripheral lymphadenopathy is very common, particularly involving the cervical (the most common head and neck manifestation of the disease), axillary, epitrochlear, and inguinal nodes. |
| <b>4B20.2</b> | <b>Sarcoidosis of the digestive system</b><br>This is a syndrome involving abnormal collections of chronic inflammatory cells (granulomas) that can form as nodules in the digestive system.<br><b>Coded Elsewhere:</b> Gastritis due to sarcoidosis (DA42.Y)<br>Oesophagitis due to sarcoidosis (DA24.Y)                                                                                                                            |
| <b>4B20.3</b> | <b>Neurosarcoidosis</b><br>This refers to sarcoidosis, a condition of unknown cause featuring granulomas in various tissues, involving the central nervous system (brain and spinal cord). It can have many manifestations, but abnormalities of the cranial nerves (a group of twelve nerves supplying the head and neck area) are the most common.                                                                                 |
| <b>4B20.4</b> | <b>Ocular sarcoidosis</b><br>This is a syndrome involving abnormal collections of chronic inflammatory cells (granulomas) that can form as nodules in multiple organs.<br><b>Coded Elsewhere:</b> Uveoparotid fever (4B20.Y)                                                                                                                                                                                                         |
| <b>4B20.5</b> | <b>Cutaneous sarcoidosis</b>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>4B20.Y</b> | <b>Other specified sarcoidosis</b>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>4B20.Z</b> | <b>Sarcoidosis, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>4B21</b>   | <b>Polyclonal hypergammaglobulinaemia</b>                                                                                                                                                                                                                                                                                                                                                                                            |

**4B22**

## **Cryoglobulinaemia**

**Coded Elsewhere:** Cryoglobulinaemic vasculitis (4A44.90)

Cutaneous microvascular disturbances due to monoclonal cryoglobulins (EF5Y)

**4B23**

## **Immune reconstitution inflammatory syndrome**

This is a condition seen in some cases of AIDS or immunosuppression, in which the immune system begins to recover, but then responds to a previously acquired opportunistic infection with an overwhelming inflammatory response that paradoxically makes the symptoms of infection worse.

**4B24**

## **Graft-versus-host disease**

Graft-versus-host disease (GVHD) occurs when lymphoid cells from an immunocompetent donor are introduced into a histo-incompatible recipient incapable of rejecting them. This usually occurs as a result of haematopoietic stem cell transplantation. The main targets attacked by the donor lymphocytes are the recipient's skin, gastrointestinal tract and liver. Acute GVHD, normally occurring within the first 100 days following transplantation, has a high mortality. The acute phase may be followed by chronic GVHD, which can also arise de novo. This usually presents as a lichenoid rash but can develop into a severe fibrosing disease affecting skin, lungs and liver.

**4B24.0**

### **Acute graft-versus-host disease**

Graft-versus-host disease presenting normally within the first 100 days of engraftment. It presents most commonly with a maculopapular rash accompanied by fever. The prognosis correlates with the extent of skin involvement, which may progress to widespread epidermal necrolysis, and the severity of gastrointestinal and liver involvement which may manifest as diarrhoea and jaundice respectively. There is a high mortality in severe acute graft-versus-host disease.

**4B24.1**

### **Chronic graft-versus-host disease**

Chronic graft-versus-host disease (GVHD) presents more than 100 days after engraftment of immunocompetent donor lymphoid cells. It has specific clinical features by which it can be distinguished from acute GVHD. It may arise de novo but frequently follows acute GVHD. Less commonly, it occurs concurrently with acute GVHD. The earlier stages of chronic GVHD are characterised by a widespread lichenoid rash, poikiloderma and involvement of nails and oral mucous membranes. If the disease remains active, progressive sclerosis of the skin and deeper tissues may result in joint contractures, fibrosis of internal organs and severe malabsorption.

## CHAPTER 05

---

### Endocrine, nutritional or metabolic diseases

This chapter has 148 four-character categories.

Code range starts with 5A00

This chapter includes endocrine diseases, nutritional diseases as well as metabolic diseases.

**Exclusions:** Transitory endocrine or metabolic disorders specific to fetus or newborn (KB60-KB6Z)

Pregnancy, childbirth or the puerperium (Chapter 18)

**Coded Elsewhere:** Symptoms, signs or clinical findings of endocrine, nutritional or metabolic diseases (MA50-MA6Y)

Endocrine, nutritional or metabolic diseases complicating pregnancy, childbirth or the puerperium (JB64.2)

This chapter contains the following top level blocks:

- Endocrine diseases
- Nutritional disorders
- Metabolic disorders
- Postprocedural endocrine or metabolic disorders

#### Endocrine diseases (5A00-5B3Z)

**Coded Elsewhere:** Neoplasms of the endocrine system  
Endocrine tumours

Disorders of the thyroid gland or thyroid hormones system (5A00-5A0Z)

Disorders due to dysfunction of thyroid gland and regulation systems of thyroid hormone actions including dysfunction of the pituitary, hypothalamus, or thyroid hormone receptors.

#### 5A00

#### Hypothyroidism

##### 5A00.0

##### Congenital hypothyroidism

Hypothyroidism is a condition where the thyroid gland produces too little or no thyroid hormone, and the condition arises at birth. Common clinical features include decreased activity and increased sleep, feeding difficulty and constipation, prolonged jaundice, myxedematous facies, large fontanels (especially posterior), macroglossia, a distended abdomen with umbilical hernia, and hypotonia.

**Coded Elsewhere:** Congenital central hypothyroidism (5A61.41)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>5A00.00</b> | <p>Permanent congenital hypothyroidism with diffuse goitre</p> <p>A condition caused by a partial or complete loss of thyroid function due to failure of the thyroid to correctly develop during the antenatal period. This condition is characterised by a swollen, smooth thyroid gland, and in infants by a dull look, puffy face, and thick tongue that sticks out. This condition may also present with choking episodes, constipation, dry brittle hair, jaundice, lack of muscle tone, low hairline, poor feeding, short height, sleepiness, or sluggishness.</p> <p><b>Exclusions:</b> transitory congenital goitre with normal function (KB62)</p> |
| <b>5A00.01</b> | <p>Permanent congenital hypothyroidism without goitre</p> <p>This is a permanent congenital state in which the thyroid gland does not make enough thyroid hormone. This diagnosis is without swelling of the thyroid gland.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>5A00.02</b> | <p>Pendred syndrome</p> <p>Pendred syndrome is characterised by the association of congenital bilateral neurosensory deafness, thyroid goitre, cochleovestibular malformation and potential vestibular dysfunction.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>5A00.03</b> | <p>Transient congenital hypothyroidism</p> <p>Transient congenital hypothyroidism is defined as transient thyroid dysfunction with mildly elevated thyroid-stimulating hormone (TSH) and low thyroxine (FT4) levels which return to normal either very promptly and spontaneously, or after several months of thyroxine therapy. The disorder is due to a variety of causes including iodine deficiency or exposure to iodine-containing compounds, transplacental passage of blocking maternal antibodies, and dyshormonogenesis.</p> <p><b>Exclusions:</b> Transitory congenital goitre with normal function (KB62)</p>                                   |

**5A03****Thyroiditis**

Thyroiditis is the inflammation of the thyroid gland. It includes acute and chronic forms of thyroiditis. Thyroiditis is usually caused by autoimmune reaction to the thyroid, resulting in inflammation and damage to the thyroid cells. The symptoms include fatigue, weight gain, depression, dry skin, and constipation.

**Exclusions:** Acquired hypothyroidism (5A00.2)  
Thyrotoxicosis (5A02)

**Coded Elsewhere:** Postpartum thyroiditis (JB44.5)

**5A03.0****Acute thyroiditis**

Acute thyroiditis is a rare form of thyroiditis directly caused by an infection, frequently bacterial.

**5A03.1****Subacute thyroiditis**

A self-limited thyroiditis associated with a triphasic clinical course of hyperthyroidism, hypothyroidism, and return to normal thyroid function. It is thought to be caused by a viral infection.

**Inclusions:** de Quervain thyroiditis  
giant-cell thyroiditis  
granulomatous thyroiditis

**Exclusions:** Autoimmune thyroiditis (5A03.2)

**5A03.2****Autoimmune thyroiditis**

A chronic inflammatory disorder of the thyroid gland associated with abnormal circulatory antibodies.

**5A03.20**

Hashimoto thyroiditis

**5A03.21**

Painless thyroiditis

A destructive thyroiditis which has an autoimmune basis in the non-postpartum period. An inflammation of the thyroid gland characterised by transient hyperthyroidism, followed by hypothyroidism and then recovery.

**5A03.2Y**

Other specified autoimmune thyroiditis

**5A03.2Z**

Autoimmune thyroiditis, unspecified

**5A03.Y**

**Other specified thyroiditis**

**5A03.Z**

**Thyroiditis, unspecified**

**5A04****Hypersecretion of calcitonin**

This is the process of elaborating, releasing, and oozing a 32-amino acid linear polypeptide hormone that is produced in humans primarily by the parafollicular cells (also known as C-cells) of the thyroid, and in many other animals in the ultimobranchial body.

**Inclusions:** Hypersecretion of thyrocalcitonin  
C-cell hyperplasia of thyroid

**5A05****Generalised resistance to thyroid hormone**

Decreased thyroid hormone action, generally induced by mutation of thyroid hormone receptors.

**5A06****Sick-euthyroid syndrome****5A0Y****Other specified disorders of the thyroid gland or thyroid hormones system****5A0Z****Disorders of the thyroid gland or thyroid hormones system, unspecified**

Diabetes mellitus (5A10-5A2Y)

A metabolic disorder with heterogeneous aetiologies which is characterised by chronic hyperglycaemia and disturbances of carbohydrate, fat and protein metabolism resulting from defects in insulin secretion, insulin action, or both.

**Coded Elsewhere:** Diabetes mellitus in pregnancy (JA63)

Neonatal diabetes mellitus (KB60.2)

**5A10****Type 1 diabetes mellitus**

Diabetes mellitus type 1 (type 1 diabetes, T1DM, formerly insulin dependent or juvenile diabetes) is a form of diabetes mellitus that results from destruction of insulin-producing beta cells, mostly by autoimmune mechanisms. The subsequent lack of insulin leads to increased blood and urine glucose.

**Exclusions:** Type 2 diabetes mellitus (5A11)  
Diabetes mellitus, other specified type (5A13)  
Diabetes mellitus in pregnancy (JA63)

**Coded Elsewhere:** Pre-existing type 1 diabetes mellitus in pregnancy (JA63.0)

**5A11****Type 2 diabetes mellitus**

Diabetes mellitus type 2 (formerly noninsulin-dependent diabetes mellitus (NIDDM) or adult-onset diabetes) is a metabolic disorder that is characterised by high blood glucose in the context of insulin resistance and relative insulin deficiency.

**Inclusions:** non-insulin-dependent diabetes of the young  
**Exclusions:** Diabetes mellitus in pregnancy (JA63)  
Diabetes mellitus, other specified type (5A13)  
Idiopathic Type 1 diabetes mellitus (5A10)

**Coded Elsewhere:** Pre-existing type 2 diabetes mellitus in pregnancy (JA63.1)

**5A12****Malnutrition-related diabetes mellitus**

**5A13****Diabetes mellitus, other specified type**

Diabetes mellitus which cannot be classified as either Type 1 or Type 2 diabetes mellitus.

**Exclusions:** Diabetes mellitus in pregnancy (JA63)  
Type 2 diabetes mellitus (5A11)  
Idiopathic Type 1 diabetes mellitus (5A10)

**5A13.0****Diabetes mellitus due to genetic defects of beta cell function**

Other specified diabetes mellitus due to genetic defects of beta cell function is a form of diabetes, which is associated with monogenetic defects in beta-cell function.

**5A13.1****Diabetes mellitus due to genetic defects in insulin action**

Other specified diabetes mellitus due to genetic defects in insulin action is a form of diabetes, which results from genetically determined abnormalities of insulin action. The metabolic abnormalities associated with mutations of the insulin receptor may range from hyperinsulinemia and modest hyperglycaemia to severe diabetes.

**5A13.2****Diabetes mellitus due to diseases of the exocrine pancreas**

Other specified diabetes mellitus due to diseases of the exocrine pancreas is a form of diabetes which is caused by any process that diffusely injures the pancreas. Acquired processes include pancreatitis, trauma, infection, pancreatectomy, and pancreatic carcinoma. With the exception of that caused by cancer, damage to the pancreas must be extensive for diabetes to occur.

**5A13.3****Diabetes mellitus due to endocrinopathies**

Other specified diabetes mellitus due to endocrinopathies is a form of diabetes caused by several hormones (e.g., growth hormone, cortisol, glucagon, epinephrine), which antagonize insulin action. Excess amounts of these hormones (e.g., acromegaly, Cushing's syndrome, glucagonoma, pheochromocytoma, respectively) can cause diabetes. This generally occurs in individuals with preexisting defects in insulin secretion, and hyperglycaemia typically resolves when the hormone excess is resolved.

**5A13.4****Diabetes mellitus due to drug or chemical**

Other specified diabetes mellitus due to drug or chemical is a form of diabetes, which is caused by drug or chemical substance that impairs insulin secretion and insulin action.

**5A13.5****Diabetes mellitus due to uncommon forms of immune-mediated diabetes**

Other specified diabetes mellitus due to uncommon forms of immune-mediated diabetes is a form of diabetes, which is caused by two known conditions. The stiff-man syndrome is an autoimmune disorder of the central nervous system characterised by stiffness of the axial muscles with painful spasms. Patients usually have high titres of the GAD autoantibodies, and approximately one-third will develop diabetes.

**5A13.6 Diabetes mellitus due to other genetic syndromes**  
 Other specified diabetes mellitus due to other genetic syndromes is a form of diabetes, which is associated with genetic syndromes.

**Coding Note:** Use additional code, if desired, to identify any associated genetic syndrome

**Coded Elsewhere:** Wolfram syndrome (5A61.5)  
 Maternally inherited diabetes and deafness (LD2H.Y)  
 Thiamine-responsive megaloblastic anaemia syndrome (5C63.Y)  
 Woodhouse-Sakati syndrome (5A61.0)  
 Mitochondrial myopathy with diabetes mellitus (8C73.Y)

**5A13.7 Diabetes mellitus due to clinically defined subtypes or syndromes**  
 Diabetes mellitus that has clinically defined subtypes or associated syndromes

**5A13.Y Diabetes mellitus due to other specified cause**

**5A14 Diabetes mellitus, type unspecified**

**Exclusions:** Idiopathic Type 1 diabetes mellitus (5A10)  
 Type 2 diabetes mellitus (5A11)  
 Diabetes mellitus, other specified type (5A13)  
 Diabetes mellitus in pregnancy (JA63)

## Acute complications of diabetes mellitus (5A20-5A2Y)

**5A20 Diabetic hyperosmolar hyperglycaemic state**

**Coding Note:** Code also the causing condition

**5A20.0 Hyperosmolar hyperglycaemic state without coma**

**Coding Note:** Code also the causing condition

**5A20.1 Hyperosmolar hyperglycaemic state with coma**

**Coding Note:** Code also the causing condition

**5A20.Z Diabetic hyperosmolar hyperglycaemic state, unspecified**

**Coding Note:** Code also the causing condition

**5A21 Hypoglycaemia in the context of diabetes mellitus**

**Coding Note:** Code also the causing condition

**5A21.0 Hypoglycaemia in the context of diabetes mellitus without coma**

**Coding Note:** Code also the causing condition

**5A21.1 Hypoglycaemia in the context of diabetes mellitus with coma**

**Coding Note:** Code also the causing condition

**5A21.Z Hypoglycaemia in the context of diabetes, unspecified**

**Coding Note:** Code also the causing condition

**5A22 Diabetic acidosis**

**Coding Note:** Code also the causing condition

**5A22.0 Diabetic ketoacidosis without coma**

**Coding Note:** Code also the causing condition

**5A22.1 Diabetic lactic acidosis**

**Coding Note:** Code also the causing condition

**5A22.2 Diabetic metabolic acidosis**

**Coding Note:** Always assign an additional code for diabetes mellitus

**5A22.3 Diabetic ketoacidosis with coma**

**Coding Note:** Code also the causing condition

**5A22.Y Other specified diabetic acidosis**

**Coding Note:** Code also the causing condition

**5A22.Z Diabetic acidosis, unspecified**

**Coding Note:** Code also the causing condition

**5A23 Diabetic coma**

**Coding Note:** Code also the causing condition

**5A24 Uncontrolled or unstable diabetes mellitus**

Brittle diabetes mellitus is a term used to describe particularly hard-to-control Type 1 or Type 2 diabetes mellitus. It results in frequent, extreme swings in blood glucose levels, causing hyperglycaemia that could lead to ketoacidosis or hypoglycaemia.

**Coding Note:** Code also the causing condition

**5A2Y Other specified acute complications of diabetes mellitus**

**Coding Note:** Code also the causing condition

Other disorders of glucose regulation or pancreatic internal secretion (5A40-5A4Z)

**Exclusions:** Benign neoplasm of endocrine pancreas (2E92.9)  
Multiple endocrine neoplasia type 1 (2F7A.0)  
Malignant neoplasm of pancreas (2C10)

**Coded Elsewhere:** Somatostatinoma (2C10.1)  
VIPoma (2C10.1)  
PPoma (2C10.1)  
GRFoma (2C10.1)

## 5A40

### Intermediate hyperglycaemia

A metabolic disorder characterised by glucose levels too high to be considered normal, though not high enough to meet the criteria for diabetes.

**Inclusions:** prediabetes  
Impaired glucose regulation

**Exclusions:** Diabetes mellitus, other specified type (5A13)  
Idiopathic Type 1 diabetes mellitus (5A10)  
Type 2 diabetes mellitus (5A11)  
Diabetes mellitus, type unspecified (5A14)  
Elevated blood glucose level (MA18.0)

**Coded Elsewhere:** Neonatal hyperglycaemia (KB60.3)

## 5A40.0

### Impaired fasting glucose

Impaired glucose tolerance is a metabolic disorder with FPG 110–125 mg/dl (6.1–6.9 mmol/l).

## 5A40.1

### Impaired glucose tolerance

Impaired glucose tolerance (IGT) is a metabolic disorder, which is characterised by 2-h postload glucose 140–199 mg/dl (7.8–11.1 mmol/l).

## 5A40.Y

### Other specified intermediate hyperglycaemia

## 5A40.Z

### Intermediate hyperglycaemia, unspecified

## 5A41

### Hypoglycaemia without associated diabetes

**Exclusions:** Hypoglycaemia in the context of diabetes mellitus (5A21)

**Coded Elsewhere:** Neonatal hypoglycaemia (KB60.4)

## 5A42

### Increased secretion of glucagon

**Exclusions:** Multiple endocrine neoplasia type 1 (2F7A.0)

**Coded Elsewhere:** Glucagonoma (2C10.1)

## 5A43

### Abnormal secretion of gastrin

**Coded Elsewhere:** Gastrinoma (2C10.1)

## 5A43.0

### Drug-induced hypergastrinaemia

A form of hypergastrinaemia that can be induced by drugs.

**5A43.1 Zollinger-Ellison syndrome**

A syndrome characterised by the presence of a gastrin-secreting tumour, usually in the pancreas or duodenum, resulting in increased gastric acidity and formation of gastric ulcers. Signs and symptoms include abdominal pain and diarrhea. It may be sporadic or a manifestation of multiple endocrine neoplasia type 1.

**Coded Elsewhere:** Anastomotic ulcer due to Zollinger-Ellison syndrome (DA62.Y)

Gastric ulcer due to Zollinger-Ellison syndrome (DA60.Y)

Duodenal ulcer due to Zollinger-Ellison syndrome (DA63.Y)

**5A43.Y Other specified abnormal secretion of gastrin**

**5A43.Z Abnormal secretion of gastrin, unspecified**

**5A44 Insulin-resistance syndromes**

**Coding Note:** Code also the causing condition

**5A45 Persistent hyperinsulinaemic hypoglycaemia of infancy**

Congenital isolated hyperinsulinism, or Persistent hyperinsulinaemic hypoglycaemia of infancy (PHHI) is defined by an inappropriate oversecretion of insulin by the endocrine pancreas that is responsible for profound hypoglycaemia, which requires aggressive medical and/or surgical treatment to prevent severe and irreversible brain damage. PHHI is a genetically heterogeneous disorder with two types of histological lesions: diffuse (DiPHHI) and focal (FoPHHI) which are clinically indistinguishable.

**5A4Y Other specified disorders of glucose regulation or pancreatic internal secretion**

**5A4Z Disorders of glucose regulation or pancreatic internal secretion, unspecified**

Disorders of the parathyroids or parathyroid hormone system (5A50-5A5Z)

Disorders of the parathyroids and parathyroid hormone system generally refer to conditions with inappropriate secretion and/or actions of parathyroid hormone that cause dysregulation of calcium metabolism.

**Exclusions:** Hypocalcaemic vitamin D dependent rickets (5C63.20)  
Hypovitaminosis D (5B57)  
Hyperphosphataemic familial tumoural calcinosis (5C54.1)  
Hypocalcaemic vitamin D resistant rickets (5C63.21)

**5A50 Hypoparathyroidism**

Hypoparathyroidism is a condition with insufficient biological actions of parathyroid hormone due to impaired secretion of parathyroid hormone or refractoriness of target tissues to parathyroid hormone.

**Exclusions:** Postprocedural hypoparathyroidism (5D42)  
tetany NOS (MB47.D)

**Coded Elsewhere:** Transitory neonatal hypoparathyroidism (KB64)

| <b>5A51</b>         | <p><b>Hyperparathyroidism</b></p> <p>Hyperparathyroidism refers to overproduction of parathormone and is most frequently due to a tumour in one of the parathyroid glands. It may also occur in response to low calcium levels, as encountered in various situations such as vitamin D deficiency or chronic kidney disease.</p> <p>Hyperparathyroidism results in weakening of the bones through loss of calcium.</p> <p><b>Exclusions:</b> Adult osteomalacia (FB83.2)<br/>infantile and juvenile osteomalacia (5B57.0)</p> |
| <b>5A51.0</b>       | <p><b>Primary hyperparathyroidism</b></p> <p>Primary hyperparathyroidism is a condition with enhanced PTH secretion and high circulatory PTH level caused by abnormal parathyroid pathology such as adenoma, hyperplasia and cancer. Primary hyperparathyroidism usually causes hypercalcaemia by enhanced PTH actions.</p>                                                                                                                                                                                                   |

- 5A51.1 Secondary hyperparathyroidism**  
 Secondary hyperparathyroidism is a condition with enhanced parathyroid hormone (PTH) secretion and high circulatory PTH level caused by metabolic changes such as hypocalcaemia, hyperphosphataemia and low 1,25-dihydroxyvitamin D.
- Coding Note:** Code also the causing condition
- Exclusions:** secondary hyperparathyroidism of renal origin (GB90.4)
- 5A51.2 Familial hypocalciuric hypercalcaemia**  
 Familial Hypocalciuric Hypercalcaemia (FHH) or benign familial hypercalcaemia is an autosomal dominant disorder of calcium metabolism that is often asymptomatic and that is biologically characterised by a significant but moderate hypercalcaemia. Serum levels of parathyroid hormone are normal or slightly increased, and urinary calcium excretion is relatively low for hypercalcaemia. CASR, GNA11 and AP2S1 have been identified as causative genes.
- 5A51.Y Other specified hyperparathyroidism**
- 5A51.Z Hyperparathyroidism, unspecified**
- 5A5Y Other specified disorders of the parathyroids or parathyroid hormone system**
- 5A5Z Disorders of the parathyroids or parathyroid hormone system, unspecified**

Disorders of the pituitary hormone system (5A60-5A6Z)

Clinical status with increased, decreased, or dysregulated secretion of pituitary hormones, which is caused by a variety of tumourous, non-tumourous, and genetic disorders.

- 5A60 Hyperfunction of pituitary gland**  
 A disease characterised by hypersecretion of adenohypophyseal hormones such as growth hormone, prolactin, thyrotropin, luteinising hormone, follicle stimulating hormone or adrenocorticotrophic hormone.
- Clinical status with excessive production of one or more pituitary hormones, which is mostly caused by hormone-producing pituitary adenomas.
- Exclusions:**
- Nelson syndrome (5A70.3)
  - overproduction of pituitary ACTH (5A70.0)
  - overproduction of thyroid-stimulating hormone (5A02)
  - Cushing syndrome (5A70)
  - Multiple endocrine neoplasia type 1 (2F7A.0)
  - Multiple endocrine neoplasia type 4 (2F7A.0)

| <b>5A60.0</b>  | <p><b>Acromegaly or pituitary gigantism</b></p> <p>Acromegaly is an acquired disorder related to excessive production of growth hormone (GH) and characterised by progressive somatic disfigurement (mainly involving the face and extremities) and systemic manifestations. The main clinical features are broadened extremities (hands and feet), widened thickened and stubby fingers, and thickened soft tissue. The disease also has rheumatologic, cardiovascular, respiratory and metabolic consequences which determine its prognosis. In the majority of cases, acromegaly is related to a pituitary adenoma, either purely GH-secreting (60%) or mixed. Transsphenoidal surgery is often the first-line treatment. When surgery fails to correct GH/IGF-I hypersecretion, medical treatment with somatostatin analogs and/or radiotherapy can be used.</p> <p><b>Inclusions:</b> Overproduction of growth hormone</p> <p><b>Exclusions:</b> constitutional gigantism (5B12)<br/>increased secretion from endocrine pancreas of growth hormone-releasing hormone (5A40-5A4Z)<br/>Constitutional tall stature (5B12)</p> |

| <b>5A60.2</b>  | <p><b>Syndrome of inappropriate secretion of antidiuretic hormone</b></p> <p>Syndrome of inappropriate antidiuretic hormone (ADH) secretion (SIADH) is characterised by continued ADH secretion, leading to hyponatremia, hypoosmolality and natriuresis. Exact prevalence is unknown. The disease has been described in all age groups. SIADH is often associated with tumours, pulmonary disease, central nervous system disorders or exposure to drugs. Occasionally, it is found in patients with adrenal, thyroid or pituitary insufficiency. The disorder is caused by gain-of-function mutations in the gene encoding the vasopressin V2 receptor. Fluid restriction is the most common treatment. The outcome is related to the underlying and associated disorders.</p>                                                                                                                                                                                                                                                                                                                                                 |

| <b>5A60.3</b>  | <p><b>Central precocious puberty</b></p> <p>Central precocious puberty is defined as the onset of pubertal changes before 8 years of age in girls and before 9.5 years of age in boys due to the overproduction of gonadotropin-releasing hormone (GnRH) by the hypothalamus. It may be idiopathic with no apparent cause (90% of cases in girls, 50% of cases in boys) or secondary to a lesion (tumour or malformation) in the hypothalamus. Other causes may include traumatic brain injury, or genetic disorders, affecting behavioural and psychological development, and final body height.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>5A70</b>   | <p><b>Cushing syndrome</b></p> <p>Cushing syndrome results from excess of corticosteroid hormones in the body due to overstimulation of the adrenal glands by excessive amounts of the hormone ACTH, secreted either by a tumour of the pituitary gland (Cushing's disease) or by a malignant tumour in the lung or elsewhere. Symptoms include weight gain, reddening of the face and neck, excess growth of body and facial hair, raised blood pressure, loss of mineral from the bones (osteoporosis), raised blood glucose levels, and sometimes mental disturbances.</p>                                                           |
| <b>5A70.0</b> | <p><b>Pituitary-dependent Cushing disease</b></p> <p>Pituitary-dependent Cushing disease is caused by a pituitary tumour, generally benign (adenoma) but rarely malignant (carcinoma), which secretes adrenocorticotropin (ACTH) autonomously, leading to hypercortisolism. The condition is associated with increased morbidity and mortality that can be mitigated by treatments that result in sustained endocrine remission. Transsphenoidal pituitary surgery (TSS) remains the mainstay of treatment for this disease but requires considerable neurosurgical expertise and experience in order to optimize patient outcomes.</p> |

| <b>5A70.2</b>  | <b>Pseudo-Cushing syndrome</b><br>This is a condition in which patients display the signs, symptoms, and abnormal hormone levels seen in Cushing's syndrome. However, pseudo-Cushing's syndrome is not caused by a problem with the hypothalamic-pituitary-adrenal axis as Cushing's is; it is an idiopathic condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>5A71.00</b> | Glucocorticoid resistance<br>Glucocorticoid resistance is a rare genetic endocrine condition characterised by generalised, partial, target tissue resistance to glucocorticoids. The clinical spectrum of the condition is broad, ranging from asymptomatic to severe cases of hyperandrogenism, fatigue and/or mineralocorticoid excess.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>5A71.01</b> | Congenital adrenal hyperplasia<br>Congenital adrenal hyperplasia (CAH) refers to a group of conditions associated with either complete (classical form) or partial (non-classical) anomalies in the biosynthesis of adrenal hormones. The condition is characterised by insufficient production of cortisol, or of aldosterone (classical form with salt wasting), associated with overproduction of adrenal androgens. In the classical form, metabolic decompensation (dehydration with hyponatraemia, hyperkalaemia and acidosis associated with mineralocorticoid deficiency, and hypoglycaemia associated with glucocorticoid deficiency) may be life-threatening from the neonatal period onwards. Genital variations may be noted at birth in affected females. Chronic hyperandrogenism may lead to accelerated growth during childhood, but advanced bone maturation may lead to a deficit in final height. Adults tend to be overweight and metabolic disturbances, bone anomalies and fertility problems may also be present. Non-classical forms are associated with later onset, during the peri- or postpubertal period, and manifest with signs of hyperandrogenism (acne, hirsutism, menstrual problems and infertility). |

**5A75****Adrenomedullary hyperfunction**

Idiopathic overstimulation of the adrenal medulla resulting in pathologic epinephrine/norepinephrine-mediated sympathetic output

**5A76****Certain specified disorders of adrenal gland****5A76.0****Premature adrenarche**

Premature development of pubic and/or axillary hair without central or peripheral precocious puberty. Children show premature clinical and/or laboratory signs of androgen action without estrogen action.

**Exclusions:** Central precocious puberty (5A60.3)  
 Congenital adrenal hyperplasia (5A71.01)  
 Peripheral precocious puberty (5A92)

**5A76.Y****Other specified disorders of adrenal gland****5A7Z****Disorders of the adrenal glands or adrenal hormone system, unspecified**

Disorders of the gonadal hormone system (5A80-5A8Z)

Gonad has a capability to produce androgen and estrogen under the control by hypothalamic–pituitary–gonadal axis. Gonadal dysfunction is caused by either insufficient actions of gonadotropin or resistance to gonadotropin.

**5A80****Ovarian dysfunction**

Pathological processes of the ovary.

**Exclusions:** isolated gonadotropin deficiency (5A61.0)  
 Postprocedural ovarian failure (5D44)

**Coded Elsewhere:** Premature ovarian failure (GA30.6)  
 Hirsutism associated with hyperandrogenaemia (ED72.1)  
 Ovarian hyperstimulation syndrome (GA32.0)  
 HAIR-AN syndrome (5A44)

**5A80.0****Clinical hyperandrogenism**

Presence of hirsutism, acne or androgenic alopecia (scalp hair loss in women)

**5A80.1****Polycystic ovary syndrome**

Condition defined by the presence of at least 2 of the following 3 criteria: oligo/anovulation; clinical or biochemical signs of hyperandrogenism; presence of polycystic ovaries as identified by ultrasound.

**Inclusions:** Sclerocystic ovary syndrome

**Exclusions:** Polycystic ovary NOS (5A80.2)

Certain disorders of puberty (5A90-5A9Z)

**Exclusions:** Central precocious puberty (5A60.3)

**5A90** **Disorder of puberty due to oestrogen resistance**

**5A91** **Delayed puberty**

This is when an organism has passed the usual age of onset of puberty with no physical or hormonal signs that it is beginning. Puberty may be delayed for several years and still occur normally, in which case it is considered constitutional delay, a variation of healthy physical development. Delay of puberty may also occur due to malnutrition, many forms of systemic disease, or to defects of the reproductive system (hypogonadism) or the body's responsiveness to sex hormones.

**Inclusions:** Delayed sexual development  
Constitutional delay of puberty

**5A92** **Peripheral precocious puberty**

Precocious puberty without activation of the GnRH-/gonadotropin axis. It includes gonadal tumours with sex hormone production and it may be part of McCune-Albright's syndrome.

**Inclusions:** Precocious menstruation

**Exclusions:** female heterosexual precocious pseudopuberty (5A71)

## Nutritional disorders (5B50-5C3Z)

Nutritional disorders in all their forms result from imbalances (excess or deficiency) in energy and/or specific macro and micronutrients. They occur when the intake of essential macronutrients and micronutrients does not meet or exceeds the metabolic demands for those nutrients. Metabolic demands vary with age and other physiological conditions, they are also affected by environmental circumstances, including poor hygiene and sanitation, which lead to diarrhea and other infections.

**Coded Elsewhere:** Nutritional or toxic disorders of the nervous system (8D40-8D4Z)

### Undernutrition (5B50-5B7Z)

Undernutrition is a condition in which the body's requirements are unmet due to underconsumption or to impaired absorption and use of nutrients. It can be produced by lack of access to food, or as a consequence of illness. Undernutrition commonly refers to a deficit in energy intake, but can also refer to deficiencies of specific nutrients, and can be either acute or chronic.

**Inclusions:**                Malnutrition NOS

**Exclusions:**                slim disease (1C62.3)  
starvation (NF07.0)  
Intestinal malabsorption (DA96.0)

Body mass index (BMI) <18.5 kg/m<sup>2</sup>

## Vitamin A deficiency

Vitamin A deficiency (VAD) is defined as a state in which tissue concentrations of vitamin A are low enough to have adverse health consequences even if there is no evidence of clinical xerophthalmia. The term xerophthalmia encompasses the clinical spectrum of ocular manifestations of vitamin A deficiency, from milder stages of night blindness and Bitot's spots, to potentially blinding stages of corneal xerosis, ulceration and necrosis (keratomalacia). In addition to the specific signs and symptoms of xerophthalmia and the risk of irreversible blindness, nonspecific symptoms include increased morbidity and mortality, poor reproductive health, increased risk of anaemia, and contributions to slowed growth and development.

**Inclusions:** Hypovitaminosis A

**Coded Elsewhere:** Acquired vitamin A deficiency anaemia (3A03.5)

### 5B55.0

#### Vitamin A deficiency with night blindness

Night blindness (poor adaptation to darkness) is generally the earliest manifestation of vitamin A deficiency. In mild cases, night blindness is apparent only after photic stress. Affected children no longer move around after dusk and prefer to sit in a secure corner, often unable to find their food or toys. Night blindness of recent onset in a preschool child is practically pathognomonic of vitamin A deficiency. All patients respond rapidly to therapy with vitamin A, usually within 48 hours.

### 5B55.1

#### Vitamin A deficiency with conjunctival xerosis

In conjunctival xerosis the epithelium of the conjunctiva is transformed from the normal columnar to the stratified squamous type, with a resultant loss of goblet cells, formation of a granular cell layer, and keratinization of the surface. Clinically, these changes are expressed as marked dryness or unwettability, the affected area appearing roughened, with fine droplets or bubbles on the surface, rather than smooth and glistening. Conjunctival xerosis first appears in the temporal quadrant, as an isolated oval or triangular patch adjacent to the limbus in the interpalpebral fissure. It is almost always present in both eyes.

### 5B55.2

#### Vitamin A deficiency with conjunctival xerosis and Bitot's spots

Generalised conjunctival xerosis suggests advanced vitamin A deficiency. The entire conjunctiva appears dry, roughened, and corrugated, sometimes skin-like. In some individuals keratin and saprophytic bacilli accumulate on the xerotic surface, giving it a foamy or cheesy appearance. Such lesions are known as Bitot's spot. With treatment active conjunctival xerosis and Bitot's spot begin to resolve within 2-5 days. Most will disappear within 2 weeks, though a significant proportion of temporal lesions may persist, in shrunken form, for months.

**5B55.3****Vitamin A deficiency with corneal xerosis**

Clinically, the cornea develops classical xerosis, a hazy, lustreless, dry appearance, first apparent near the inferior limbus. Many children have characteristic superficial punctate lesions of the inferior-nasal aspects of their cornea that stain brightly with fluorescein. Early in the disease they are visible only through a slit-lamp examination. With more severe disease the punctate lesions become more numerous and spread upwards over the central cornea, and the corneal stroma becomes oedematous. Thick, keratinized plaques resembling Bitot's spot may form on the corneal surface. These are often densest in the interpalpebral zone. With treatment, these corneal plaques peel off, sometimes leaving superficial erosion which quickly heals. Corneal xerosis responds within 2-5 days to vitamin A therapy, the cornea regaining its normal appearance in 1-2 weeks.

**5B55.4****Vitamin A deficiency with corneal ulceration or keratomalacia**

Ulceration/keratomalacia indicates permanent destruction of part or all of the corneal stroma, resulting in permanent structural alteration. Ulcers are classically round to oval "punched-out" defects, as if a trephine or cork-borer had been applied to the eye. The surrounding cornea is generally xerotic but otherwise clear, and typically lacks the grey, infiltrated appearance of ulcers of bacterial origin. There may be more than one ulcer. Small ulcers are almost invariably confined to the periphery of the cornea, especially its inferior and nasal aspects. The ulceration may be shallow, but is commonly deep. Perforations become plugged with iris, thereby preserving the anterior chamber. In more advanced disease the necrotic stroma sloughs, leaving a large ulcer or descemetocoele. As with smaller ulcers, this is usually peripheral and heals as a dense, white, adherent leukoma. With therapy, superficial ulcers often heal with surprisingly little scarring; deeper ulcers, especially perforations, form dense peripheral adherent leukomas.

**5B55.5****Vitamin A deficiency with xerophthalmic scars of cornea or blindness**

Xerophthalmia or "dry eye" remains the most important cause of childhood blindness in many developing countries. Healed sequelae of prior corneal disease related to vitamin A deficiency include opacities or scars of varying density (nebula, macula, leukoma), weakening and outpouching of the remaining corneal layers (staphyloma and descemetocoele) and, where loss of intraocular contents has occurred, phthisis bulbi, a scarred shrunken globe. Such end-stage lesions are not specific for xerophthalmia and may arise from numerous other conditions, notably trauma and infection.

**5B55.Y****Vitamin A deficiency with other specified manifestations****5B55.Z****Vitamin A deficiency, unspecified****5B56****Vitamin C deficiency**

This condition groups several clinical consequences secondary to vitamin C deficiency with scurvy being the most severe presentation. The populations at risk of vitamin C deficiency are those for whom the fruit and vegetable supply is minimal. Epidemics of scurvy are associated with famine and war, when food supply is small and irregular. Children fed predominantly heat-treated (ultra-high-temperature or pasteurized) milk or unfortified formulas and not receiving fruits and fruit juices are at significant risk for symptomatic disease.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>5B56.0</b> | <b>Scurvy</b><br><p>Scurvy is a disease caused by a lack of vitamin C (ascorbic acid) in the diet. Vitamin C plays a central role in collagen and ground-substance formation, metabolism of aromatic amino acids (phenylalanine, tyrosine), reduction of folic acid to folinic acid and a broad range of biochemical redox reactions. Clinical features include perifollicular haemorrhages, ecchymoses, swollen bleeding gums, stomatitis and epistaxis.</p> <p><b>Coded Elsewhere:</b> Scorbutic anaemia (3A03.2)</p>                                                                                                  |

| <b>5B57</b>   | <b>Vitamin D deficiency</b><br><p>Vitamin D is a fat-soluble vitamin contained naturally in very few foods, added to milk, available as a supplement, and produced endogenously with exposure to sunlight. Vitamin D deficiency can be caused by inadequate intake due to dietary factors (e.g., special diets (veganism), lactose intolerance or allergies) and/or limited exposure to sunlight due to geographic location, sun avoidance, or shiftwork. Severe deficiency results in disordered bone modelling called rickets in childhood (open growth plates), and osteomalacia in adults (fused growth plates).</p> |
| <b>5B57.0</b> | <b>Vitamin D deficiency rickets</b><br><p>Rickets is a disease of growing bone that is due to unmineralized matrix at the growth plates and occurs in children only before fusion of the epiphyses. There are many causes of rickets, including vitamin D disorders, calcium deficiency, phosphorous deficiency, and distal renal tubular acidosis. With the increased survival rate of very low birthweight infants, rickets in this age group has become a significant problem.</p>                                                                                                                                    |
| <b>5B57.1</b> | <b>Vitamin D deficiency osteomalacia</b><br><p>Osteomalacia is a disorder of defective mineralization of newly formed osteoid at sites of bone turnover. Several different disorders cause osteomalacia via mechanisms that result in hypocalcaemia, hypophosphatemia, or direct inhibition of the mineralization process. Severe vitamin D deficiency, secondary to inadequate dietary intake, lack of sun exposure, gastric bypass or malabsorption (celiac disease), is the most common cause of osteomalacia in adults.</p>                                                                                          |

| <b>5B57.Z</b> | <b>Vitamin D deficiency, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**5B58****Vitamin E deficiency**

Vitamin E deficiency is a condition that causes haemolysis and/or neurologic manifestations. Red blood cell fragility occurs and can produce a haemolytic anaemia. Neuronal degeneration produces peripheral neuropathies, ophthalmoplegia, and destruction of posterior columns of spinal cord. Neurologic disease is frequently irreversible if deficiency is not corrected early enough. Vitamin E deficiency may also contribute to the haemolytic anaemia and retrolental fibroplasia seen in premature infants.

**Coded Elsewhere:** Acquired vitamin E deficiency anaemia (3A03.6)

Dementia due to vitamin E deficiency (6D85.Y)

**5B59****Vitamin K deficiency**

Vitamin K is necessary for the synthesis of clotting factors II, VII, IX, and X, and deficiency of vitamin K can result in clinically significant bleeding. Vitamin K deficiency typically affects infants, who experience a transient deficiency related to inadequate intake, or patients of any age who have decreased vitamin K absorption. Mild vitamin K deficiency can affect long-term bone and vascular health.

**Coded Elsewhere:** Neonatal vitamin K deficiency (KA8F)

**5B5A****Vitamin B1 deficiency**

Vitamin B1 deficiency manifests itself principally with changes involving the nervous system (polyneuritis and paralysis of the peripheral nerves), the cardiovascular system (cardiac insufficiency and generalised oedema), and also the gastrointestinal tract (constipation, vomiting, and abdominal pain).

**5B5A.0****Beriberi**

The clinical picture of Beriberi is usually divided into a dry (neuritic) type and a wet (cardiac) type. The disease is wet or dry depending on the amount of fluid which accumulates in the body due to factors like cardiac function, kidney lesions and others; even though the exact cause for this oedema has never been successfully explained. Many cases of thiamine deficiency show a mixture of the two main features and are more properly termed thiamine deficiency with cardiopathy and peripheral neuropathy. The infant shows signs of cyanosis and an acute cardiac attack can follow with the infant usually dying within 2 to 4 hours. The common age for this form of the deficiency disease is one month up through the third month. This type of deficiency responds very dramatically to thiamine.

| <b>5B5A.Z</b>  | <b>Vitamin B1 deficiency, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**5B5B****Vitamin B2 deficiency**

The signs of riboflavin deficiency are sore throat, hyperaemia, oedema of the pharyngeal and oral mucous membranes, cheilosis, angular stomatitis, glossitis, seborrheic dermatitis, and normochromic normocytic anaemia associated with pure red cell cytoplasia of the bone marrow. The major cause of hyporiboflavinosis is inadequate dietary intake as a result of limited food supply, which is sometimes exacerbated by poor food storage or processing. Children in developing countries will commonly demonstrate clinical signs of riboflavin deficiency during periods of the year when gastrointestinal infections are prevalent. Decreased assimilation of riboflavin also results from abnormal digestion, such as that which occurs with lactose intolerance.

**Inclusions:** Riboflavin deficiency

**Coded Elsewhere:** Acquired riboflavin deficiency anaemia (3A03.41)

**5B5C****Vitamin B3 deficiency**

Niacin deficiency classically results in pellagra, which is a chronic wasting disease associated with a characteristic erythematous dermatitis that is bilateral and symmetrical, a dementia after mental changes including insomnia and apathy preceding an overt encephalopathy, and diarrhoea resulting from inflammation of the intestinal mucous surfaces. Pellagra occurs endemically in poorer areas of Africa, China and India.

**Inclusions:** niacin deficiency NOS

**5B5C.0****Pellagra**

Pellagra is a potentially life-threatening disorder due to niacin deficiency and is observed in malnourished individuals, especially alcoholics, and as a complication of isoniazid therapy. The diagnosis is often overlooked or delayed. Pellagra manifests as diarrhoea, dermatitis, dementia, which usually appear in this order. Gastrointestinal tract symptoms always precede skin involvement, which presents initially with a sunburn-like blistering erythema, typically affecting the dorsal surfaces of the hands, face, neck, arms, and feet. With time the skin becomes thickened, scaly and pigmented.

**5B5C.Y****Other specified vitamin B3 deficiency****5B5C.Z****Vitamin B3 deficiency, unspecified**

**5B5D****Vitamin B6 deficiency**

A deficiency of vitamin B6 alone is uncommon because it usually occurs in association with a deficit in other B-complex vitamins. Hypovitaminosis B6 may often occur with riboflavin (vitamin B2) deficiency. The classical clinical symptoms of vitamin B6 deficiency are a seborrheic dermatitis, microcytic anaemia, epileptiform convulsions, and depression and confusion. Infants are especially susceptible to insufficient intakes, which can lead to epileptiform convulsions. Moreover, there is usually a decrease in circulating lymphocytes and sometimes a normocytic, microcytic, or sideroblastic anaemia as well. As is the case with other micronutrient deficiencies, vitamin B6 deficiency results in an impairment of the immune system. Several medical conditions can also affect vitamin B6 metabolism and thus lead to deficiency symptoms.

**Exclusions:** Pyridoxine-responsive sideroblastic anaemia, not elsewhere classified (3A72.1)

**Coded Elsewhere:** Acquired pyridoxine deficiency anaemia (3A03.40)

Pyridoxine dependent epilepsy with antiquitin mutations (8A61.0Y)

**5B5E****Folate deficiency**

Nutritional deficiency of folate is common in people consuming a limited diet. This can be exacerbated by malabsorption conditions, including coeliac disease and tropical sprue. Pregnant women are at risk for folate deficiency because pregnancy significantly increases the folate requirement, especially during periods of rapid fetal growth (i.e. in the second and third trimester). During lactation, losses of folate in milk also increase the folate requirement. During pregnancy, there is an increased risk of fetal neural tube defects (NTDs), with risk increasing 10-fold as folate status goes from adequate to poor. Between days 21 and 27 post-conception, the neural plate closes to form what will eventually be the spinal cord and cranium. Spina bifida, anencephaly, and other similar conditions are collectively called NTDs. They result from improper closure of the spinal cord and cranium, respectively, and are the most common congenital abnormalities associated with folate deficiency.

**5B5F****Vitamin B12 deficiency**

Vegetarianism and poverty-imposed near-vegetarianism are the most common causes of nutritional cobalamin insufficiency worldwide in all age groups. In such populations, low maternal cobalamin status is associated with adverse pregnancy outcomes (preterm birth, intrauterine growth retardation, early recurrent miscarriage), neural tube defects, reduced neurocognitive performance in children, accelerated bone turnover, and low bone mineral density with fractures. Insufficient cobalamin intake is also seen in breast-fed infants of mothers with pernicious anaemia.

**Inclusions:** cobalamin deficiency  
cyanocobalamin deficiency

**Coded Elsewhere:** Vitamin B12 deficiency anaemia due to low intake (3A01.2)  
Vitamin B12 deficiency anaemia due to intrinsic factor deficiency (3A01.3)  
Vitamin B12 deficiency anaemia due to intestinal disease (3A01.4)  
Drug-induced vitamin B12 deficiency anaemia (3A01.5)  
Acquired vitamin B12 deficiency anaemia (3A01.Z)  
Dementia due to vitamin B12 deficiency (6D85.Y)

**5B5G****Biotin deficiency**

Isolated biotin deficiency is rare. Signs of biotin deficiency in humans have been demonstrated in individuals who consume raw egg white over long periods and in total parenteral nutrition (TPN) before biotin supplementation in patients with malabsorption. The clinical findings of biotin deficiency include dermatitis, conjunctivitis, alopecia, and central nervous system abnormalities. In adults fed raw egg white (which contains avidin, a protein that binds biotin with such high affinity that it renders it biounavailable) or receiving biotin-free TPN for months to years, thinning of hair, frequently with loss of hair colour, has been reported. Most adults with the deficiency demonstrate a red, scaly, skin rash, frequently around the eyes, nose, and mouth. Most of the adults have neurological symptoms, including depression, lethargy, hallucinations, and paraesthesia of the extremities.

**5B5H****Pantothenic acid deficiency**

Pantothenic deficiency is rare: only reported as a result of feeding semisynthetic diets or an antagonist to the vitamin. Experimental, isolated deficiency in humans produces fatigue, abdominal pain, vomiting, insomnia, and paraesthesias of the extremities.

**5B5J****Choline deficiency**

Choline deficiency is rare. Individuals fed with total parenteral nutrition (TPN) solutions lacking choline develop fatty liver and liver damage.

**5B5K****Mineral deficiencies**

**Exclusions:** Disorders of mineral absorption or transport (5C64)  
**Coded Elsewhere:** Hypokalaemia (5C77)  
Hypomagnesaemia (5C64.41)

**5B5K.0****Iron deficiency**

Iron deficiency is a state in which there is insufficient iron to maintain the normal physiological function of blood, brain and muscles. It can exist in the absence of anaemia if it has not lasted long enough or if it has not been severe enough to cause the haemoglobin concentration to fall below the threshold for the specific sex and age group. Iron deficiency is the most common nutritional deficiency.

**Exclusions:** Iron deficiency anaemia (3A00)

**Coded Elsewhere:** Acquired iron deficiency anaemia due to blood loss (3A00.0)  
 Acquired iron deficiency anaemia due to low intake (3A00.1)  
 Acquired iron deficiency anaemia due to decreased absorption (3A00.2)  
 Acquired iron deficiency anaemia due to increased requirement (3A00.3)  
 Acquired iron deficiency anaemia (3A00.Z)  
 Dementia due to iron deficiency (6D85.Y)

**5B5K.1****Calcium deficiency**

Hypocalcaemia is defined as a total serum calcium concentration of less than 8.4 mg/dl (2.1 mmol/litre) or an ionized calcium concentration of less than 4.48 mg/dl (1.12 mmol/litre). There are numerous causes of hypocalcaemia, chronic kidney disease being the most common cause. Other causes are: vitamin D deficiency, disorders associated with acquired or genetic hypoparathyroidism, including intravenous bisphosphonate therapy, post-thyroidectomy and post-parathyroidectomy, and acute pancreatitis. Hypocalcaemia may be associated with a spectrum of clinical manifestations, ranging from few symptoms if the hypocalcaemia is mild, to life-threatening seizures, refractory heart failure, or laryngospasm if it is severe. In addition to severity, the rate of development of hypocalcaemia and chronicity determine the clinical manifestations.

**Exclusions:** Disorders of calcium metabolism (5C64.5)

**Coded Elsewhere:** Neonatal hypocalcaemia (KB61.2)  
 Neonatal osteopenia (KB61.3)  
 Myopathy due to calcium deficiency (8D40.2)

**5B5K.10****Tetany due to acute calcium deficiency**

The hallmark of acute hypocalcaemia is tetany, which is characterised by neuromuscular irritability. The symptoms of tetany may be mild (peri-oral numbness, paresthesias of the hands and feet, muscle cramps) or severe (carpopedal spasm, laryngospasm, and focal or generalised seizures, which must be distinguished from the generalised tonic muscle contractions that occur in severe tetany). Other patients have less specific symptoms such as fatigue, hyperirritability, anxiety, and depression, and some patients, even with severe hypocalcaemia, have no neuromuscular symptoms. Factors that determine the variation in frequency and severity of symptoms include acid-base status (hypocalcaemia and alkalosis act synergistically to cause tetany), hypomagnesaemia, and potassium balance.

**5B5K.1Y**

Other specified calcium deficiency

**5B5K.1Z**

Calcium deficiency, unspecified

**5B5K.2****Zinc deficiency**

The clinical features of severe zinc deficiency in humans are growth retardation, delayed sexual and bone maturation, skin lesions, diarrhoea, alopecia, impaired appetite, increased susceptibility to infections mediated via defects in the immune system, and the appearance of behavioural changes. The effects of marginal or mild zinc deficiency are less clear. A reduced growth rate and impairments of immune defence are so far the only clearly demonstrated signs of mild zinc deficiency in humans. Other effects, such as impaired taste and wound healing, which have been claimed to result from a low zinc intake, are less consistently observed.

**Coded Elsewhere:** Neonatal nutritional zinc deficiency (5C64.21)

**5B5K.3****Iodine deficiency**

Iodine deficiency disorders (IDD), caused mainly by a low dietary supply of iodine, refer to all of the consequences of iodine deficiency in a population that can be prevented by ensuring that the population has an adequate intake of iodine. Iodine deficiency is the most frequent cause of preventable brain damage in childhood.

**Coded Elsewhere:** Iodine-deficiency-related thyroid disorders or allied conditions (5A00.1)

Acquired hypothyroidism (5A00.2)

Congenital hypothyroidism due to iodine deficiency (5A00.04)

**5B5K.4****Fluorine deficiency**

A condition caused by a deficiency of fluoride. Low fluorine concentrations in an individual's dental plaque and enamel may result in an increased risk for dental caries at any age. Fluorine deficiencies might also show negative effects on human's bone health.

**5B5K.5****Sodium chloride deficiency**

Sodium and chloride are usually found together in most foods as sodium chloride, also termed salt. For that reason, the effects of sodium and chloride deficiency are considered together. Deficiency can be caused by poor intake or increased losses (e.g., diuretics increase the urinary excretion of water, sodium, and chloride; in cystic fibrosis the sodium and chloride content of sweat is very high; gastrointestinal losses are associated with diarrhoeal diseases, emesis, ostomy output and other causes).

**5B5K.6****Copper deficiency**

Dietary deficiency is rare; it has been observed in premature and low birthweight infants fed exclusively a cow's milk diet and in individuals on long-term total parenteral nutrition without copper. Clinical manifestations include depigmentation of skin and hair, neurologic disturbances, leukopenia, hypochromic microcytic anaemia, and skeletal abnormalities.

**Coded Elsewhere:** Copper deficiency anaemia (3A03.3)

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>5B5K.7</b> | <b>Selenium deficiency</b><br>Selenium deficiency is rare but has been observed in individuals on long-term total parenteral nutrition lacking selenium. Clinical manifestations of deficiency arising from such situations are uncommon and poorly defined. They include muscular weakness and myalgia with, in several instances, the development of congestive heart failure. The importance of selenium for thyroid hormone metabolism is evident from changes in the T3–T4 ratio which develop after relatively mild selenium depletion in infants and elderly subjects.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>5B5K.8</b> | <b>Chromium deficiency</b><br>Deficiency in humans is only described in long-term total parenteral nutrition patients receiving insufficient chromium. Hyperglycaemia or impaired glucose tolerance occurs. Elevated plasma free fatty acid concentrations, neuropathy, encephalopathy, and abnormalities in nitrogen metabolism are also reported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>5B5K.9</b> | <b>Manganese deficiency</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>5B5K.A</b> | <b>Molybdenum deficiency</b><br>Molybdenum functions as a cofactor for a limited number of enzymes in humans: sulphite oxidase, xanthine oxidase and aldehyde oxidase. A rare severe metabolic defect causing molybdenum cofactor deficiency and preventing these enzymes from being synthesized has been described. Few infants with such defects survive the first days of life, and those who survive have severe neurological abnormalities. Although molybdenum deficiency related to a dietary deficiency is extremely rare in humans, it has been described in long-term total parenteral nutrition as being secondary to the administration of sulphite. Symptoms include: tachycardia, headache, night blindness, irritability and coma. Biochemical changes can consist of elevated plasma and methionine concentration, low serum uric acid concentration, high urinary thiosulfate and low urinary uric acid and sulphate levels. |
| <b>5B5K.B</b> | <b>Vanadium deficiency</b><br>A biological role of vanadium in humans has not yet been identified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**5B63****Sequelae of rickets**

Bowed legs and/or arms, knock-knees, deformities of the thoracic cage and/or spine and/or skeletal dysplasia secondary to chronic or advanced rickets

**5B6Y****Other specified sequelae of malnutrition or certain specified nutritional deficiencies****5B6Z****Sequelae of malnutrition or certain specified nutritional deficiencies, unspecified****5B70****Essential fatty acid deficiency**

Deficiency of EFA (linoleic acid, linolenic acid, arachidonic acid, docosapentaenoic acid, docosahexaenoic acid and eicosapentaenoic acid) can be caused by deficient intake, particularly, in rapidly growing infants (as preterm infants), in patients receiving parenteral nutrition without an adequate source of EFA, and in diseases with fat malabsorption. Clinical findings are: dermatitis, alopecia, and thrombocytopenia. The role of EFA during pregnancy and lactation has been highlighted, and the role of long-chain n-3 fatty acids as structural components for the development of the retinal function and central nervous system is now accepted. The prenatal period is a time of increased risk for omega-3 deficiency, as maternal tissue stores tend to decline as they are used for the developing fetus. Deficiency of n-3 EFA can affect growth, and cognitive and visual function in infants. The characteristic signs of deficiency attributed to the n-6 fatty acids are scaly skin rash, increased transepidermal water loss, reduced growth, and elevation of the plasma ratio of eicosatrienoic acid: arachidonic acid. EFA deficiency in special populations has been linked to hematologic disturbances and diminished immune response. Long-chain n-3 and n-6 fatty acids are essential nutrients and also, as part of the overall fat supply may affect the prevalence and severity of cardiovascular disease, diabetes, cancer and age-related functional decline.

**5B71****Protein deficiency****5B7Y****Other specified undernutrition****5B7Z****Unspecified undernutrition**

Overweight, obesity or specific nutrient excesses (5B80-5C1Z)

**Overweight or obesity (5B80-5B81.Z)****5B80****Overweight or localised adiposity**

Overweight is a condition characterized by excessive adiposity. Overweight is assessed by the body mass index (BMI), which is a surrogate marker of adiposity calculated as weight (kg)/height<sup>2</sup> (m<sup>2</sup>). The BMI categories for defining overweight vary by age and gender in infants, children and adolescents. For adults, overweight (or pre-obesity) is defined by a BMI ranging from 25.00 to 29.99 kg/m<sup>2</sup>. Localized adiposity is a condition characterized by accumulation of adipose tissue in specific regions of the body independently of BMI.

- 5B81.00**      Obesity in children or adolescents
- In infants, children and adolescents, BMI categories for defining obesity vary by age and gender based on WHO growth charts. Children 0 to 5 years have obesity if weight-for-length/height or BMI-for-age is above 3 standard deviations of the median of the WHO Child Growth Standards.
- Children aged 5 to 19 years have obesity if BMI-for-age is above 2 standard deviations of the median of WHO Growth Reference for School-aged Children and Adolescents.
- 5B81.01**      Obesity in adults
- Obesity is defined as a body mass index (BMI) greater than or equal to 30.00 kg/m<sup>2</sup>. There are three levels of severity in recognition of different management options.
- 5B81.1**      **Drug-induced obesity**
- 5B81.Y**      **Other specified obesity**
- 5B81.Z**      **Obesity, unspecified**

## Certain specified nutrient excesses (5B90-5B9Z)

Any disease caused by an excess of specific nutrients. Confirmation is by blood test.

### **5B90**      **Vitamin excesses**

#### **5B90.0**      **Hypervitaminosis A**

Because vitamin A is fat soluble and can be stored, primarily in the liver, routine consumption of large amounts of vitamin A over a period of time can result in toxic symptoms, including liver damage, bone abnormalities and joint pain, alopecia, headaches, vomiting, and skin desquamation. Hypervitaminosis A appears to be due to abnormal transport and distribution of vitamin A and retinoids caused by overloading of the plasma transport mechanisms. Very high single doses can cause transient acute toxic symptoms that may include bulging fontanelles in infants; headaches in older children and adults; and vomiting, diarrhoea, loss of appetite, and irritability in all age groups. Rarely does toxicity occur from ingestion of food sources of preformed vitamin A. When this occurs, it usually results from very frequent consumption of liver products.

**Coded Elsewhere:** Pseudotumour Cerebri related to Hypervitaminosis A (8D41.2)

#### **5B90.1**      **Hypercarotenaemia**

Excessive intake of carotenoids is not associated with toxicity but can cause yellow coloration of the skin that disappears when intake is reduced. This disorder is especially likely to occur in children with liver disease, diabetes mellitus or hypothyroidism, and in those who do not have enzymes that metabolize carotenoids.

| <b>5B90.2</b> | <b>Hypervitaminosis D</b><br>Hypervitaminosis D is secondary to excessive intake of vitamin D. It can occur with long-term high intake or with a substantial, acute ingestion. Excess amounts result in abnormally high concentrations of calcium and phosphate in the serum. The signs and symptoms of vitamin D intoxication are secondary to hypercalcaemia. Gastrointestinal manifestations include nausea, vomiting, constipation, abdominal pain and pancreatitis. Possible cardiac findings are hypertension, decreased Q-T interval and arrhythmias. The central nervous system effects of hypercalcaemia include lethargy, hypotonia, confusion, disorientation, depression, psychosis, hallucinations and coma. Hypercalcaemia impairs renal concentrating mechanisms, which can lead to polyuria, dehydration and hypernatremia. Hypercalcaemia can also lead to acute renal failure, nephrolithiasis and nephrocalcinosis, which can result in chronic renal insufficiency. Deaths are usually associated with arrhythmias or dehydration. |
| <b>5B90.3</b> | <b>Megavitamin-B6 syndrome</b><br>A disease caused by an excess of vitamin B6. This disease is characterised by progressive sensory ataxia, diminished or absent tendon reflexes, and impaired sense of touch, temperature and pain. | <b>5B91.0</b> | <b>Hypercalcaemia</b><br>Hypercalcaemia is a condition caused by increased calcium levels. The higher the calcium levels and the faster its level rises, the more severe will be the symptoms. When present, symptoms are caused by dehydration secondary to urinary losses of calcium, water and other electrolytes, and to an increase in membrane potential caused by the elevation in extracellular fluid ionized calcium concentration. Patients with moderate to severe hypercalcaemia often complain of nausea and vomiting, symptoms likely related to dehydration as well as to the effects of the hypercalcaemia on central nervous system function. Because hypercalcaemia tends to hyperpolarize membranes, a range of neurologic and neuromuscular signs and symptoms can occur. Patients with mild hypercalcaemia often complain of fatigue, depressed mood and asthenia. Gastrointestinal motility is impaired; this commonly results in constipation.<br><br><b>Coded Elsewhere:</b> Myopathy due to hypercalcaemia (8D41.1)           |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>5B91.1</b> | <p><b>Zinc excess</b></p> <p>Adverse effects associated with chronic intake of supplemental zinc include suppression of immune response, decrease in high-density lipoprotein (HDL) cholesterol and reduced copper status. Acute adverse effects of excess zinc include epigastric pain, nausea, vomiting, loss of appetite, abdominal cramps, diarrhoea, headaches and gastrointestinal distress.</p> <p><b>Coded Elsewhere:</b> Myelopathy due to excess of zinc (8D41.Y)</p>                                                                                                                                                                                                                                                                            |
| <b>5B91.2</b> | <p><b>Sodium chloride excess</b></p> <p>The main adverse effect of increased sodium chloride in the diet is increased blood pressure, which is a major risk factor for cardiovascular-renal diseases. However, evidence from a variety of studies, including observational studies and clinical trials, has demonstrated heterogeneity in the blood pressure responses to sodium intake. Those individuals with the greatest reductions in blood pressure in response to decreased sodium intake are termed "salt sensitive".</p>                                                                                                                                                                                                                          |
| <b>5B91.3</b> | <p><b>Fluorine excess</b></p> <p>The primary adverse effects associated with chronic, excess fluoride intake are enamel and skeletal fluorosis. Enamel fluorosis is a dose-response effect caused by fluoride intake during the pre-eruptive development of teeth. The development of skeletal fluorosis and its severity is directly related to the level and duration of exposure. The clinical signs in advanced stages may include dose-related calcification of ligaments, osteosclerosis, exostoses, possibly osteoporosis of long bones, muscle wasting and neurological defects due to hypercalcification of vertebrae.</p> <p><b>Coded Elsewhere:</b> Dental enamel fluorosis (DA07.0)</p>                                                        |
| <b>5B91.4</b> | <p><b>Aluminium excess</b></p> <p>Patients receiving long-term parenteral nutrition are at increased risk of aluminium toxicity because of bypass of the gastrointestinal tract during parenteral nutrition infusion. Complications of aluminium toxicity include metabolic bone disease, aluminium-associated encephalopathy in adults and impaired neurological development in preterm infants.</p>                                                                                                                                                                                                                                                                                                                                                      |
| <b>5B91.5</b> | <p><b>Manganese excess</b></p> <p>Manganese toxicity in humans is a well-recognised occupational hazard for people who inhale manganese dust. High concentrations of circulating manganese as a result of total parenteral nutrition have also been associated with manganese toxicity. People with chronic liver disease have neurological pathology and behavioural signs of manganese neurotoxicity, probably because elimination of manganese in bile is impaired. The most prominent effect is central nervous system pathology, especially in the extra-pyramidal motor system. The lesions and symptoms are similar to those of Parkinson's disease.</p> <p><b>Coded Elsewhere:</b> Dementia or parkinsonism due to manganese toxicity (6D84.Y)</p> |

Metabolic disorders (5C50-5D2Z)

- androgen resistance syndrome (LD2A.4)
- Congenital adrenal hyperplasia (5A71.01)
- Ehlers-Danlos syndrome (LD28.1)
- Hereditary haemolytic anaemia due to enzyme deficiency (3A10)
- Marfan syndrome (LD28.01)
- 5-alpha-reductase deficiency (5A81.1)
- Cystic fibrosis (CA25)
- Metabolic disorders following abortion, ectopic or molar pregnancy (JA05.5)

Inborn errors of metabolism comprise a large class of genetic diseases involving disorders of metabolism. The majority are due to defects of single genes that code for enzymes that facilitate conversion of various substances (substrates) into others (products).

**5C50** Inborn errors of amino acid or other organic acid metabolism

**5C50.0      Phenylketonuria**

Phenylketonuria is a hereditary metabolic disease, characterised by deficiency of phenylalanine hydroxylase, an enzyme necessary for the transformation of phenylalanine into tyrosine. Untreated, phenylketonuria leads to mental retardation, sometimes profound, as well as hypopigmentation. Dietary phenylalanine restriction allows patients to lead almost normal lives.

**5C50.00** Classical phenylketonuria

Classical phenylketonuria is a severe form of phenylketonuria (PKU) an inborn error of amino acid metabolism characterised in untreated patients by severe intellectual deficit and neuropsychiatric complications.

| <b>5C50.70</b> | Glycine encephalopathy<br>Isolated nonketotic hyperglycinemia is an inborn disorder of glycine metabolism whose onset is generally neonatal with coma, severe hypotonia, myoclonic seizures, and microcephaly, usually progressing to severe intellectual deficit and tetrapyramidal syndrome.                                                                                                                                                                                                                                              |
| <b>5C50.71</b> | Sarcosinaemia<br>Sarcosinaemia is a metabolic disorder characterised by an increased concentration of sarcosine in plasma and urine due to sarcosine dehydrogenase deficiency. Prevalence has been estimated at 1:28,000 to 1:350,000 in newborn screening programs. Sarcosinaemia is most probably a benign condition without significant clinical problems. It is transmitted in an autosomal recessive manner. Mutations in the gene for sarcosine dehydrogenase, located on chromosome 9q34, have been associated with this deficiency. |

| <b>5C50.D0</b> | <b>Maple-syrup-urine disease</b><br>Maple syrup urine disease (MSUD) is a disorder of branched-chain amino acids metabolism. Four forms are described. The early onset classic form manifests after birth by lethargy, poor feeding and neurological signs of intoxication. Clinical course without treatment is characterised by deepening coma with maple syrup odour of urine. Subacute MSUD manifests later with encephalopathy, mental disability, major hypotonia, opisthotonus and cerebral atrophy with severe outcome. The intermittent form of MSUD may manifest at any age and presents with repeated ketoacidotic coma. Thiamine-responsive MSUD is a very rare form characterised by improvement of the biochemical profile with thiamine therapy. |

| <b>5C50.F0</b> | <p>Prolidase deficiency</p> <p>Prolidase deficiency is a very rare inborn error of metabolism characterised by mild to severe skin lesions particularly on the face, palms, lower legs and soles, together with other variable features.</p>                                                                                                                                                                                                                                                                                 |
| <b>5C50.F1</b> | <p>Carnosinaemia</p> <p>Carnosinaemia is a very rare inherited disorder of the metabolism of peptides that presents with serum carnosinase deficiency, variable degrees of intellectual deficit, sometimes with seizures, while a few patients are asymptomatic.</p>                                                                                                                                                                                                                                                         |
| <b>5C50.F2</b> | <p>Homocarnosinosis</p> <p>Homocarnosinosis is a metabolic defect characterised by progressive spastic diplegia, intellectual deficit and retinitis pigmentosa. This extremely rare disorder has been reported in only one family, namely a woman and three of her children. The latter showed but their mother was symptom free. It is therefore uncertain whether there is a relationship between the biochemical defect and the clinical symptoms. Inheritance in the reported family seems to be autosomal dominant.</p> |

| <b>5C51.2</b>  | <b>Disorders of glyoxylate metabolism</b><br>Primary hyperoxaluria, or oxalosis, is a rare metabolic disorder transmitted as an autosomal recessive disease, including both type 1, the most frequent, and type 2, extremely rare. Hyperoxaluria type 1 is due to a defect of the peroxysomal hepatic enzyme L-alanine: glyoxylate aminotransferase (AGT). Hyperoxaluria type 2 is extremely rare and is due to glycerate dehydrogenase deficiency.                                                                                                                                                                                                                                                  |
| <b>5C51.20</b> | Primary hyperoxaluria type 1<br>Primary hyperoxaluria type 1 is a rare metabolic disorder due to a defect of the peroxysomal hepatic enzyme L-alanine: glyoxylate aminotransferase (AGT). The infantile form is characterised by chronic renal failure due to massive oxalate deposition. In other patients, urolithiasis develops with infections, haematuria, renal colic or acute renal failure due to complete obstruction. End-stage renal failure occurs before 15 years of age in half the cases and the resulting increase of circulating oxalate leads to its deposition in tissues causing cardiac conduction defects, hypertension, distal gangrene, and reduced joint mobility and pain. |

| <b>5C52.11</b> | <p>Bile acid synthesis defect with cholestasis</p> <p>Anomalies of bile acid synthesis are a group of sterol metabolism disorders due to enzyme deficiencies of bile acid synthesis in infants, children and adults, with variable manifestations that include cholestasis, neurological disease, and fat malabsorption. Eight inborn errors have been clearly identified, 7 of which lead to liver cholestasis and include: 3<math>\beta</math>-hydroxy-C27-steroid oxidoreductase deficiency (type 1), <math>\Delta</math>4-3-oxosteroid 5<math>\beta</math>-reductase deficiency (type 2), oxysterol 7<math>\alpha</math>-hydroxylase deficiency (type 3), 2-methylacyl-CoA racemase deficiency (type 4), bile acid CoA ligase deficiency, and cerebrotendinous xanthomatosis. Cholesterol 7<math>\alpha</math>-hydroxylase deficiency leads to hypercholesterolaemia without liver cholestasis.</p> |

| <b>5C53.00</b> | <p>Pyruvate kinase deficiency</p> <p>This refers to an enzyme involved in glycolysis. It catalyzes the transfer of a phosphate group from phosphoenolpyruvate (PEP) to ADP, yielding one molecule of pyruvate and one molecule of ATP.</p> <p><b>Coded Elsewhere:</b> Glycogen storage disease due to muscle pyruvate kinase deficiency (5C51.3)</p> <p style="padding-left: 40px;">Haemolytic anaemia due to red cell pyruvate kinase deficiency (3A10.Y)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>5C53.01</b> | <p>Lactate dehydrogenase deficiency</p> <p>This refers to a deficiency in the enzyme present in a wide variety of organisms, including plants and animals. This exists in four distinct enzyme classes. Two of them are cytochrome c-dependent enzymes, each acting on either D-lactate (EC 1.1.2.4) or L-lactate (EC 1.1.2.3). The other two are NAD(P)-dependent enzymes, each acting on either D-lactate (EC 1.1.1.28) or L-lactate (EC 1.1.1.27). This article is about the NAD(P)-dependent L-lactate dehydrogenase.</p>                                                                                                                                                                                                                                                                                                                                                                           |

| <b>5C53.24</b> | <p>Leigh syndrome</p> <p>Leigh syndrome or subacute necrotizing encephalomyelopathy is a progressive neurological disease defined by specific neuropathological features associating brainstem and basal ganglia lesions. Loss of motor milestones, hypotonia with poor head control, recurrent vomiting, and a movement disorder are common initial symptoms. Pyramidal and extrapyramidal signs, nystagmus, breathing disorders, ophthalmoplegia and peripheral neuropathy are often noted later. Epilepsy is relatively uncommon. Leigh syndrome has multiple causes, all of which imply a defect in aerobic energy production, ranging from the pyruvate dehydrogenase complex to the oxidative phosphorylation pathway.</p> <p><b>Coded Elsewhere:</b> Maternally inherited Leigh syndrome (8C73.Y)</p> |

| <b>5C55.01</b> | <p>Lesch-Nyhan syndrome</p> <p>Lesch-Nyhan syndrome (LNS) is the most severe form of hypoxanthine-guanine phosphoribosyltransferase (HPRT) deficiency, a hereditary disorder of purine metabolism, and is associated with uric acid overproduction (UAO), neurological troubles, and behavioural problems. Patients are normal at birth. Psychomotor delay becomes evident within 3 to 6 months with a delay in head support and sitting, hypotonia and athetoid movements. Sandy urine in diapers or crystalluria with urinary tract obstruction are common forms of presentation. Patients usually show mild to moderate intellectual deficit. Diagnosis is suspected when psychomotor delay occurs in a patient with elevated UA in blood and urine. Undetectable HPRT enzyme activity in peripheral blood or in intact cells (erythrocyte, fibroblast) and molecular genetic testing confirm the diagnosis. Inheritance is X-linked recessive.</p> |

**5C58****Inborn errors of porphyrin or heme metabolism**

**Inclusions:** defects of catalase and peroxidase

**Coded Elsewhere:** X-linked sideroblastic anaemia, pyridoxine-responsive (3A72.00)

**5C58.0****Disorders of bilirubin metabolism or excretion**

**Coded Elsewhere:** Neonatal hyperbilirubinaemia (KA87)

**5C58.00****Crigler-Najjar syndrome**

Crigler-Najjar syndrome is an autosomal recessive disorder of bilirubin metabolism characterised by unconjugated hyperbilirubinemia due to a hepatic deficit of bilirubin glucuronosyltransferase activity. Two types have been described, CNS types 1 and 2, depending on whether the enzymatic deficit is complete or partial: clinical manifestations vary accordingly. Patients present with isolated jaundice that appears early in life. Biological analyses detect severe unconjugated hyperbilirubinemia with normal liver function tests. Abdominal imaging studies (plain X-rays, CT scans or ultrasonograms) and liver histology findings are normal. Diagnosis is generally confirmed by genomic DNA analysis.

**5C58.01****Gilbert syndrome**

Gilbert's syndrome is an inherited liver disorder characterised by jaundice due to unconjugated hyperbilirubinemia, resulting from a partial deficiency in hepatic bilirubin glucuronosyltransferase activity.

**5C58.02****Dubin-Johnson syndrome**

Dubin-Johnson syndrome (DJS) is a benign, inherited liver disorder characterised clinically by chronic, predominantly conjugated, hyperbilirubinemia and histopathologically by black-brown pigment deposition in parenchymal liver cells.

**5C58.03****Progressive familial intrahepatic cholestasis**

Progressive familial intrahepatic cholestasis (PFIC) refers to a heterogeneous group of autosomal recessive disorders of childhood that disrupt bile formation and present with cholestasis of hepatocellular origin. Three types of PFIC have been identified and are related to mutations in hepatocellular transport system genes involved in bile formation. PFIC1 and PFIC2 usually appear in the first months of life, whereas onset of PFIC3 may also occur later in infancy, in childhood or even during young adulthood.

**5C58.04****Benign recurrent intrahepatic cholestasis****5C58.0Y****Other specified disorders of bilirubin metabolism or excretion****5C58.0Z****Disorders of bilirubin metabolism or excretion, unspecified**

| <b>5C58.1</b>  | <b>Porphyrias</b><br><p>Porphyrias constitute a group of diseases characterised by intermittent neuro-visceral manifestations, cutaneous lesions or by the combination of both. All porphyrias are caused by a deficiency in one of the enzymes of the heme biosynthesis pathway resulting in an accumulation of porphyrins and/or their precursors in the liver or bone marrow. Clinical signs of the disease usually appear in adulthood, but some porphyrias affect children. Porphyrias can be classified according to the main location of the metabolic anomaly. Direct or indirect neurotoxicity may cause neurological manifestations. Transmission of hereditary porphyrias is autosomal and either dominant with weak penetrance or recessive with complete penetrance. Diagnosis is mainly based on the measurement of porphyrins and their precursors in biological samples.</p> <p><b>Coded Elsewhere:</b> Liver diseases due to porphyria (5C90.1)</p> |
| <b>5C58.10</b> | <b>Porphyria cutanea tarda</b><br><p>Porphyria cutanea tarda (PCT) is due to an accumulation of uroporphyrins in plasma from blockage of the normal haem synthetic pathway in the liver at the level of uroporphyrinogen decarboxylase (URO-D). The majority of cases are sporadic and frequently associated with iron overload. PCT manifests as skin fragility and blistering in light-exposed skin, particularly on the dorsa of the hands, together with hypertrichosis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>5C58.12</b> | <b>Erythropoietic porphyrias</b><br><p>Erythropoietic porphyrias are associated clinically with photosensitivity and biochemically with abnormal accumulation of porphyrins in erythrocytes. They include erythropoietic protoporphyria and the very rare congenital erythropoietic porphyria.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>5C58.13</b> | <b>Variegate porphyria</b><br><p>Variegate porphyria is a form of acute hepatic porphyria characterised by the occurrence of neuro-visceral attacks with or without the presence of cutaneous lesions (bullous photodermatitis).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>5C60.1</b> | <b>Cystinosis</b><br>Cystinosis is a metabolic disease characterised by an accumulation of cystine inside the lysosomes of different tissues due to a defect in cystine transport out of lysosomes. There are three clinical forms : infantile, juvenile and ocular. The infantile form is severe, multisystem disease, with impaired proximal tubular reabsorptive capacity, with severe fluid-electrolyte balance alterations, cystine deposits in various organs and progression towards renal failure after 6 years of age. Juvenile cystinosis appear around 8 years of age and has an intermediate clinical picture with end-stage renal disease occurring after the age of 15. The ocular, adult form presents with photophobia. |

| <b>5C61.0</b>  | <b>Glucose-galactose malabsorption</b><br>Glucose-galactose malabsorption is characterised by diarrhoea and severe neonatal dehydration. Around 300 cases have been described to date. Moderate glucosuria has also been reported, but fructose absorption is normal. Glucose-galactose malabsorption is caused by a mutation in the SLC5A1 gene, encoding the glucose-sodium cotransporter, SGLT1. The mode of transmission is autosomal recessive. The fatal consequences of this syndrome can be avoided by following a glucose and galactose restricted diet.<br><b>Exclusions:</b> Glucose or galactose intolerance of newborn (5C51.42)                                                                           |
| <b>5C61.1</b>  | <b>Maltase-glucoamylase deficiency</b><br>Chronic diarrhea due to glucoamylase deficiency is characterised by chronic diarrhoea in infancy or childhood in association with intestinal glucoamylase deficiency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>5C61.2</b>  | <b>Congenital sucrase-isomaltase deficiency</b><br>Congenital sucrase-isomaltase deficiency (CSID) is a carbohydrate intolerance disorder characterised by malabsorption of oligosaccharides and disaccharides. CSID is transmitted as an autosomal recessive trait and is caused by mutations in the brush-border membrane complex sucrase-isomaltase (SI), which is required for the breakdown of sucrose and starch into monosaccharides. The SI deficiency results in an accumulation of disaccharides in the lumen, causing osmotic diarrhoea. The prognosis for patients is good as the starch intolerance usually resolves during the first few years of life and sucrose intolerance usually improves with age. |
| <b>5C61.3</b>  | <b>Alpha, alpha trehalase deficiency</b><br>Alpha, alpha trehalase deficiency is characterised by diarrhoea and vomiting after ingestion of trehalose, a disaccharide found mainly in mushrooms. The disease is very rare in most populations but the incidence has been estimated at least 1 in 13 in Greenland. Isolated trehalose intolerance is due to a deficiency of trehalase (TREH; 11q23.3), a brush-border membrane glycoprotein.                                                                                                                                                                                                                                                                             |
| <b>5C61.4</b>  | <b>Acquired monosaccharide malabsorption</b><br>This is an acquired condition in which the cells lining the intestine cannot take in one or all of the sugars glucose, galactose or fructose, which prevents proper digestion of these molecules and larger molecules made from them.<br>It may cause osmotic diarrhoea.                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>5C64.10</b> | <p>Iron overload diseases</p> <p>Iron overload is the accumulation of excess iron in body tissues. Iron overload usually occurs as a result of a genetic predisposition to absorb and store iron in excess amounts, the most common form of which is hereditary hemochromatosis. Iron overload can also occur as a complication of other hematologic disorders that require chronic transfusion therapy, repeated injections of parenteral iron, or excessive iron ingestion. Excessive iron stores usually accumulate in the reticuloendothelial tissues and cause little damage ("hemosiderosis"). If overload continues, iron eventually begins to accumulate in tissues such as hepatic parenchyma, pancreas, heart and synovium, causing hemochromatosis.</p> <p><b>Coded Elsewhere:</b> Friedreich ataxia (8A03.10)<br/> Atransferrinaemia (3A00.Y)<br/> Microcytic anaemia with liver iron overload (3A00.Y)</p> |

| <b>5C64.20</b> | <p>Acrodermatitis enteropathica</p> <p>Acrodermatitis enteropathica is an uncommon autosomal recessive disorder of intestinal zinc absorption. Signs usually appear within the first months of life with an exudative and crusted erythema located predominantly around body orifices (mouth, anogenital) and on the scalp and distal extremities. The signs are often misdiagnosed as being due to infection. The condition responds rapidly to zinc supplementation which must be continued throughout life.</p>                                                                                                                                                                                                                                                                                                                                                                                                      |

**5C78****Fluid overload**

This is the condition where there is too much fluid in the blood. The opposite condition is hypovolemia, which is too little fluid volume in the blood. Fluid volume excess in the intravascular compartment occurs due to an increase in total body sodium content and a consequent increase in extracellular body water. The mechanism usually stems from compromised regulatory mechanisms for sodium handling as seen in congestive heart failure (CHF), kidney failure, and liver failure. It may also be caused by excessive intake of sodium from foods, intravenous (IV) solutions and blood transfusions, medications, or diagnostic contrast dyes.

**5C7Y****Other specified disorders of fluid, electrolyte or acid-base balance****5C7Z****Disorders of fluid, electrolyte or acid-base balance, unspecified**

Disorders of lipoprotein metabolism or certain specified lipidaemias (5C80-5C8Z)

Elevated levels of lipoprotein(a), or Lp(a), in the blood. It is associated with an elevated risk of cardiovascular diseases.

**Exclusions:** Sphingolipidosis (5C56.0)

**Coded Elsewhere:** Lipoid dermatoarthritis (FA38.Y)

Multicentric reticulohistiocytosis (EE8Y)

Lipoid proteinosis (LD27.Y)

**5C80****Hyperlipoproteinaemia**

Disorders of lipoprotein metabolism that result in high levels of lipoproteins in the circulating blood

**5C80.0****Hypercholesterolaemia****5C80.00****Primary hypercholesterolaemia**

This is a genetic disorder characterised by high cholesterol levels, specifically very high levels of low-density lipoprotein (LDL, "bad cholesterol"), in the blood and early cardiovascular disease.

**Coded Elsewhere:** Sitosterolaemia (5C52.1Y)

**5C80.01****Secondary hypercholesterolaemia**

**Coding Note:** Code also the causing condition

**5C80.0Z****Hypercholesterolaemia, unspecified****5C80.1****Hypertriglyceridaemia**

A form of hyperlipidaemia characterised by abnormally elevated levels of triglyceride-rich lipoproteins in the blood. It is associated with an elevated risk of cardiovascular morbidity.

**Inclusions:** Hyperlipidaemia, group B  
Endogenous hyperglyceridaemia

| <b>5C81.1</b> | <b>Hypobetalipoproteinaemia</b><br>Hypobetalipoproteinemia (HBL) constitutes a group of lipoprotein metabolism disorders that are characterised by permanently low levels (below the 5th percentile) of apolipoprotein B and LDL cholesterol. There are two types of HBL: familial hypobetalipoproteinemia and chylomicron retention disease (CMRD; see these terms). The familial form can be severe with early onset (abetalipoproteinemia/homozygous familial hypobetalipoproteinemia; see this term) or benign (benign familial hypobetalipoproteinemia; see this term). (Please add the sentence). Severe familial HBL and CMRD appear in infancy or childhood. As a result they are often associated with growth delay, diarrhoea with steatorrhoea, and fat malabsorption. Benign familial hypobetalipoproteinemia is generally asymptomatic, but in adults is occasionally associated with dietary intolerance to fat. HBL disorders are caused by mutations in proteins involved in the synthesis, secretion and catabolism of lipoproteins containing apolipoprotein B (LDL, VLDL and chylomicrons). |
| <b>5C81.Y</b> | <b>Other specified hypolipoproteinaemia</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**5C90****Metabolic or transporter liver disease**

**Exclusions:** Alcoholic liver disease (DB94)  
Non-alcoholic fatty liver disease (DB92)  
Drug-induced or toxic liver disease (DB95)  
Acute fatty liver of pregnancy (JA65.0)

**Coded Elsewhere:** Bile acid synthesis defect with cholestasis (5C52.11)  
Progressive familial intrahepatic cholestasis (5C58.03)  
Benign recurrent intrahepatic cholestasis (5C58.04)  
Glycogen storage disease (5C51.3)  
Disorders of galactose metabolism (5C51.4)  
Disorders of fructose metabolism (5C51.5)  
Alpha-1-antitrypsin deficiency (5C5A)  
Reye syndrome (8E46)

**5C90.0****Liver diseases due to urea cycle defects**

This is a group of liver diseases due to defects in the urea cycle, which is a metabolic cycle of nitrogen-containing compounds that produces the waste product urea.

**Coded Elsewhere:** Argininosuccinic aciduria (5C50.A0)  
Carbamoylphosphate synthetase deficiency (5C50.A1)  
Argininaemia (5C50.A2)  
Ornithine carbamoyltransferase deficiency (5C50.AY)

**5C90.1****Liver diseases due to disorders of porphyrin or bilirubin metabolism or transport**

These are liver diseases due to disorders of porphyrin and bilirubin metabolism and transport

**Exclusions:** Defects of catalase and peroxidase (5C58)

**Coded Elsewhere:** Porphyrria cutanea tarda (5C58.10)  
Variegate porphyria (5C58.13)  
Crigler-Najjar syndrome (5C58.00)  
Gilbert syndrome (5C58.01)  
Dubin-Johnson syndrome (5C58.02)  
Rotor syndrome (5C58.0Y)

**5C90.2****Liver diseases due to disorders of amino acid metabolism**

This is liver disease due to the disorder of the various biochemical processes responsible for the synthesis of proteins and amino acids, and the breakdown of proteins (and other large molecules, too) by catabolism.

**Coded Elsewhere:** Disorders of tyrosine metabolism (5C50.1)  
Citrullinaemia (5C50.A3)

- 5C90.3 Liver disease due to disorders of lysosomal storage**  
 This is liver disease due to a group of approximately 50 rare inherited metabolic disorders that result from defects in lysosomal function.  
**Coded Elsewhere:** Gaucher disease (5C56.0Y)  
 Niemann-Pick disease (5C56.0Y)  
 Wolman disease (5C56.0Y)  
 Cholesteryl ester storage disease (5C56.0Y)
- 5C90.4 Liver diseases due to mitochondrial disorders**  
 This is liver disease due to a group of disorders caused by dysfunctional mitochondria, the organelles that generate energy for the cell.
- 5C90.5 Liver diseases due to disorders of mineral metabolism**  
 This is a liver disease due to a disorder of the organic compound required by an organism as a vital nutrient in limited amounts.
- Coding Note:** Code also the causing condition
- 5C90.Y Other specified metabolic or transporter liver disease**
- 5C90.Z Metabolic or transporter liver disease, unspecified**

Other metabolic disorders (5D00-5D0Y)

**Exclusions:** histiocytosis X (chronic) (2B31.2)

**Coded Elsewhere:** Tophaceous gout (FA25.20)

### **Amyloidosis**

Amyloidosis is a vast group of diseases defined by the presence of insoluble protein deposits in tissues. Its diagnosis is based on histological findings. Amyloidoses are classified according to clinical signs and biochemical type of amyloid protein involved. Most amyloidoses are multisystemic, 'generalised' or 'diffuse'. There are a few forms of localised amylosis. The most frequent forms are AL amyloidosis (immunoglobulins), AA (inflammatory), and ATTR (transthyretin accumulation).

**Exclusions:** Dementia due to Alzheimer disease (6D80)

## **5D00.0**

### **AL amyloidosis**

AL amyloid is due to the deposition of immunoglobulin light chains in glomeruli where they are seen as Congo red binding fibrils and immuno-stain specifically for kappa or lambda light chains. By light microscopy there is amorphous hyaline material in the mesangium and capillary walls. A light chain producing plasma cell or B-cell dysplasia is responsible. Other organs are also involved in this systemic disease.

**Coded Elsewhere:** Isolated cerebral amyloid angiopathy (8B22.3)

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>5D00.1</b>       | <b>AA amyloidosis</b><br>AA amyloid is due to the deposition of the acute phase reactant serum amyloid A protein (SAA) in glomeruli where they are seen as Congo red binding fibrils which immunostain specifically for SAA. Chronic inflammation is responsible. Other organs are also involved in this systemic disease.                                                                                                                                                      |
| <b>5D00.2</b>       | <b>Hereditary amyloidosis</b><br>Hereditary amyloidosis (familial amyloidosis) is an inherited disorder that often affects the liver, nerves, heart and kidneys. Many different types of gene abnormalities present at birth are associated with an increased risk of amyloid disease. The type and location of an amyloid gene abnormality can affect the risk of certain complications, the age at which symptoms first appear, and the way the disease progresses over time. |
| <b>5D00.20</b>      | Hereditary ATTR amyloidosis                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>5D00.21</b>      | Non-neuropathic heredofamilial amyloidosis<br>This is an amyloidosis (the formation of insoluble proteins, or amyloids) of inherited origin that does not affect the peripheral nerves. The most common sites of deposits are associated with the kidney and heart.<br><b>Coded Elsewhere:</b> Familial Mediterranean fever with amyloidosis (4A60.0)                                                                                                                           |

| <b>5D0Y</b>         | <b>Other specified metabolic disorders</b>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>5D2Z</b>         | <b>Metabolic disorders, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Postprocedural endocrine or metabolic disorders (5D40-5D46)

Any endocrine or metabolic disorder caused by or subsequent to any medical procedure.

**Coded Elsewhere:** Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

### **5D40**      **Postprocedural hypothyroidism**

#### **5D40.0**      **Postirradiation hypothyroidism**

**5D40.00**      Hypothyroidism postradioactive iodine ablation

**5D40.0Y**      Other specified postirradiation hypothyroidism

**5D40.0Z**      Postirradiation hypothyroidism, unspecified

#### **5D40.Y**      **Other specified postprocedural hypothyroidism**

#### **5D40.Z**      **Postprocedural hypothyroidism, unspecified**

### **5D41**      **Postprocedural hypoinsulinaemia**

This is a low level of insulin that can result after medical procedures, including radiation, and it carries a risk of developing diabetes mellitus.

**Inclusions:**      Postpancreatectomy hyperglycaemia  
                         Postsurgical hypoinsulinaemia

### **5D42**      **Postprocedural hypoparathyroidism**

This refers to a postprocedural decreased function of the parathyroid glands with underproduction of parathyroid hormone. This can lead to low levels of calcium in the blood, often causing cramping and twitching of muscles or tetany (involuntary muscle contraction), and several other symptoms.

**Inclusions:**      Parathyroprival tetany

### **5D43**      **Postprocedural hypopituitarism**

This is the postprocedural decreased (hypo) secretion of one or more of the eight hormones normally produced by the pituitary gland at the base of the brain. If there is decreased secretion of most pituitary hormones, the term panhypopituitarism (pan meaning "all") is used.

### **5D44**      **Postprocedural ovarian failure**

A condition in women characterised by amenorrhea, caused by or subsequent to any intervention. This condition may also present with hot flashes, night sweats, irritability, poor concentration, decreased sex drive, pain during sex, vaginal dryness.

### **5D45**      **Postprocedural testicular hypofunction**

A condition in men characterised by testosterone deficiency, caused by or subsequent to any intervention. This condition may present with fatigue, decreased libido, erectile dysfunction, negative mood states, decreased lean body mass, increased fat mass, or decreased bone mineral density.

**5D46**

**Postprocedural adrenocortical hypofunction**

A condition caused by or subsequent to any medical procedure. This condition is characterised by adrenocortical hormone deficiency. This condition may present with chronic fatigue, muscle weakness, loss of appetite, weight loss or abdominal pain.

## CHAPTER 06

---

# Mental, behavioural or neurodevelopmental disorders

This chapter has 162 four-character categories.

Code range starts with 6A00

Mental, behavioural and neurodevelopmental disorders are syndromes characterised by clinically significant disturbance in an individual's cognition, emotional regulation, or behaviour that reflects a dysfunction in the psychological, biological, or developmental processes that underlie mental and behavioural functioning. These disturbances are usually associated with distress or impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**Exclusions:** Acute stress reaction (QE84)  
Uncomplicated bereavement (QE62)

**Coded Elsewhere:** Sleep-wake disorders (7A00-7B2Z)  
Sexual dysfunctions (HA00-HA0Z)  
Gender incongruence (HA60-HA6Z)

This chapter contains the following top level blocks:

- Neurodevelopmental disorders
- Schizophrenia or other primary psychotic disorders
- Catatonia
- Mood disorders
- Anxiety or fear-related disorders
- Obsessive-compulsive or related disorders
- Disorders specifically associated with stress
- Dissociative disorders
- Feeding or eating disorders
- Elimination disorders
- Disorders of bodily distress or bodily experience
- Disorders due to substance use or addictive behaviours
- Impulse control disorders
- Disruptive behaviour or dissocial disorders
- Personality disorders and related traits
- Paraphilic disorders
- Factitious disorders
- Neurocognitive disorders

- Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium
- Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere

## Neurodevelopmental disorders (6A00-6A0Z)

Neurodevelopmental disorders are behavioural and cognitive disorders that arise during the developmental period that involve significant difficulties in the acquisition and execution of specific intellectual, motor, language, or social functions. Although behavioural and cognitive deficits are present in many mental and behavioural disorders that can arise during the developmental period (e.g., Schizophrenia, Bipolar disorder), only disorders whose core features are neurodevelopmental are included in this grouping. The presumptive etiology for neurodevelopmental disorders is complex, and in many individual cases is unknown.

**Coded Elsewhere:** Primary tics or tic disorders (8A05.0)

Secondary neurodevelopmental syndrome (6E60)

### 6A00

#### Disorders of intellectual development

Disorders of intellectual development are a group of etiologically diverse conditions originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately two or more standard deviations below the mean (approximately less than the 2.3rd percentile), based on appropriately normed, individually administered standardized tests. Where appropriately normed and standardized tests are not available, diagnosis of disorders of intellectual development requires greater reliance on clinical judgment based on appropriate assessment of comparable behavioural indicators.

**Coding Note:** Use additional code, if desired, to identify any known aetiology.

**Exclusions:** Dementia (6D80-6D8Z)

### 6A00.0

#### Disorder of intellectual development, mild

A mild disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately two to three standard deviations below the mean (approximately 0.1 – 2.3 percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons often exhibit difficulties in the acquisition and comprehension of complex language concepts and academic skills. Most master basic self-care, domestic, and practical activities. Persons affected by a mild disorder of intellectual development can generally achieve relatively independent living and employment as adults but may require appropriate support.

**6A00.1                      Disorder of intellectual development, moderate**

A moderate disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately three to four standard deviations below the mean (approximately 0.003 – 0.1 percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Language and capacity for acquisition of academic skills of persons affected by a moderate disorder of intellectual development vary but are generally limited to basic skills. Some may master basic self-care, domestic, and practical activities. Most affected persons require considerable and consistent support in order to achieve independent living and employment as adults.

**6A00.2                      Disorder of intellectual development, severe**

A severe disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately four or more standard deviations below the mean (less than approximately the 0.003rd percentile), based on appropriately normed, individually administered standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons exhibit very limited language and capacity for acquisition of academic skills. They may also have motor impairments and typically require daily support in a supervised environment for adequate care, but may acquire basic self-care skills with intensive training. Severe and profound disorders of intellectual development are differentiated exclusively on the basis of adaptive behaviour differences because existing standardized tests of intelligence cannot reliably or validly distinguish among individuals with intellectual functioning below the 0.003rd percentile.

**6A00.3                      Disorder of intellectual development, profound**

A profound disorder of intellectual development is a condition originating during the developmental period characterised by significantly below average intellectual functioning and adaptive behaviour that are approximately four or more standard deviations below the mean (approximately less than the 0.003rd percentile), based on individually administered appropriately normed, standardized tests or by comparable behavioural indicators when standardized testing is unavailable. Affected persons possess very limited communication abilities and capacity for acquisition of academic skills is restricted to basic concrete skills. They may also have co-occurring motor and sensory impairments and typically require daily support in a supervised environment for adequate care. Severe and profound disorders of intellectual development are differentiated exclusively on the basis of adaptive behaviour differences because existing standardized tests of intelligence cannot reliably or validly distinguish among individuals with intellectual functioning below the 0.003rd percentile.

**6A00.4**                    **Disorder of intellectual development, provisional**

Disorder of intellectual development, provisional is assigned when there is evidence of a disorder of intellectual development but the individual is an infant or child under the age of four or it is not possible to conduct a valid assessment of intellectual functioning and adaptive behaviour because of sensory or physical impairments (e.g., blindness, pre-lingual deafness), motor or communication impairments, severe problem behaviours or co-occurring mental and behavioural disorders.

**6A00.Z**                    **Disorders of intellectual development, unspecified**

**Coding Note:**        Use additional code, if desired, to identify any known aetiology.

**6A01**

**Developmental speech or language disorders**

Developmental speech or language disorders arise during the developmental period and are characterised by difficulties in understanding or producing speech and language or in using language in context for the purposes of communication that are outside the limits of normal variation expected for age and level of intellectual functioning. The observed speech and language problems are not attributable to regional, social, or cultural/ethnic language variations and are not fully explained by anatomical or neurological abnormalities. The presumptive aetiology for Developmental speech or language disorders is complex, and in many individual cases, is unknown.

**6A01.0**                    **Developmental speech sound disorder**

Developmental speech sound disorder is characterised by difficulties in the acquisition, production and perception of speech that result in errors of pronunciation, either in number or types of speech errors made or the overall quality of speech production, that are outside the limits of normal variation expected for age and level of intellectual functioning and result in reduced intelligibility and significantly affect communication. The errors in pronunciation arise during the early developmental period and cannot be explained by social, cultural, and other environmental variations (e.g., regional dialects). The speech errors are not fully explained by a hearing impairment or a structural or neurological abnormality.

**Inclusions:**            Functional speech articulation disorder

**Exclusions:**            Deafness not otherwise specified (AB52)

                              Diseases of the nervous system (Chapter 08)

                              Dysarthria (MA80.2)

                              Verbal apraxia (MB4A)

**6A01.1      Developmental speech fluency disorder**

Developmental speech fluency disorder is characterised by frequent or pervasive disruption of the normal rhythmic flow and rate of speech characterised by repetitions and prolongations in sounds, syllables, words, and phrases, as well as blocking and word avoidance or substitutions. The speech dysfluency is persistent over time. The onset of speech dysfluency occurs during the developmental period and speech fluency is markedly below what would be expected for age. Speech dysfluency results in significant impairment in social communication, personal, family, social, educational, occupational or other important areas of functioning. The speech dysfluency is not better accounted for by a Disorder of Intellectual Development, a Disease of the Nervous System, a sensory impairment, or a structural abnormality, or other speech or voice disorder.

**Exclusions:**            Tic disorders (8A05)

**6A01.2      Developmental language disorder**

Developmental language disorder is characterised by persistent deficits in the acquisition, understanding, production or use of language (spoken or signed), that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The individual's ability to understand, produce or use language is markedly below what would be expected given the individual's age. The language deficits are not explained by another neurodevelopmental disorder or a sensory impairment or neurological condition, including the effects of brain injury or infection.

**Exclusions:**            Autism spectrum disorder (6A02)  
                              Diseases of the nervous system (Chapter 08)  
                              Deafness not otherwise specified (AB52)  
                              Selective mutism (6B06)

**6A01.20      Developmental language disorder with impairment of receptive and expressive language**

Developmental language disorder with impairment of receptive and expressive language is characterised by persistent difficulties in the acquisition, understanding, production, and use of language that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The ability to understand spoken or signed language (i.e., receptive language) is markedly below the expected level given the individual's age and level of intellectual functioning, and is accompanied by persistent impairment in the ability to produce and use spoken or signed language (i.e., expressive language).

**Inclusions:**            developmental dysphasia or aphasia, receptive type  
**Exclusions:**            acquired aphasia with epilepsy [Landau-Kleffner] (8A62.2)  
                              Autism spectrum disorder (6A02)  
                              Selective mutism (6B06)  
                              dysphasia NOS (MA80.1)  
                              Diseases of the nervous system (Chapter 08)  
                              Deafness not otherwise specified (AB52)

**6A01.21****Developmental language disorder with impairment of mainly expressive language**

Developmental language disorder with impairment of mainly expressive language is characterised by persistent difficulties in the acquisition, production, and use of language that arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. The ability to produce and use spoken or signed language (i.e., expressive language) is markedly below the expected level given the individual's age and level of intellectual functioning, but the ability to understand spoken or signed language (i.e., receptive language) is relatively intact.

**Inclusions:** Developmental dysphasia or aphasia, expressive type

**Exclusions:** acquired aphasia with epilepsy [Landau-Kleffner] (8A62.2)

Selective mutism (6B06)

dysphasia and aphasia: developmental, receptive type (6A01.20)

dysphasia NOS (MA80.1)

aphasia NOS (MA80.0)

Diseases of the nervous system (Chapter 08)

Deafness not otherwise specified (AB52)

**6A01.22****Developmental language disorder with impairment of mainly pragmatic language**

Developmental language disorder with impairment of mainly pragmatic language is characterised by persistent and marked difficulties with the understanding and use of language in social contexts, for example making inferences, understanding verbal humour, and resolving ambiguous meaning. These difficulties arise during the developmental period, typically during early childhood, and cause significant limitations in the individual's ability to communicate. Pragmatic language abilities are markedly below the expected level given the individual's age and level of intellectual functioning, but the other components of receptive and expressive language are relatively intact. This qualifier should not be used if the pragmatic language impairment is better explained by Autism Spectrum Disorder or by impairments in other components of receptive or expressive language.

**Exclusions:** Diseases of the nervous system (Chapter 08)

Selective mutism (6B06)

**6A01.23****Developmental language disorder, with other specified language impairment**

Developmental language disorder with other specified language impairment is characterised by persistent difficulties in the acquisition, understanding, production or use of language (spoken or signed), that arise during the developmental period and cause significant limitations in the individual's ability to communicate. The pattern of specific deficits in language abilities is not adequately captured by any of the other developmental language disorder categories.

**Exclusions:** Autism spectrum disorder (6A02)

Diseases of the nervous system (Chapter 08)

Disorders of intellectual development (6A00)

Selective mutism (6B06)

**6A01.Y**                    **Other specified developmental speech or language disorders**

**6A01.Z**                    **Developmental speech or language disorders, unspecified**

**6A02**                    **Autism spectrum disorder**

Autism spectrum disorder is characterised by persistent deficits in the ability to initiate and to sustain reciprocal social interaction and social communication, and by a range of restricted, repetitive, and inflexible patterns of behaviour, interests or activities that are clearly atypical or excessive for the individual's age and sociocultural context. The onset of the disorder occurs during the developmental period, typically in early childhood, but symptoms may not become fully manifest until later, when social demands exceed limited capacities. Deficits are sufficiently severe to cause impairment in personal, family, social, educational, occupational or other important areas of functioning and are usually a pervasive feature of the individual's functioning observable in all settings, although they may vary according to social, educational, or other context. Individuals along the spectrum exhibit a full range of intellectual functioning and language abilities.

**Inclusions:**                    Autistic disorder

**Exclusions:**                    Rett syndrome (LD90.4)

**6A02.0**                    **Autism spectrum disorder without disorder of intellectual development and with mild or no impairment of functional language**

All definitional requirements for autism spectrum disorder are met, intellectual functioning and adaptive behaviour are found to be at least within the average range (approximately greater than the 2.3rd percentile), and there is only mild or no impairment in the individual's capacity to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires.

**6A02.1**                    **Autism spectrum disorder with disorder of intellectual development and with mild or no impairment of functional language**

All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is only mild or no impairment in the individual's capacity to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires.

**6A02.2**                    **Autism spectrum disorder without disorder of intellectual development and with impaired functional language**

All definitional requirements for autism spectrum disorder are met, intellectual functioning and adaptive behaviour are found to be at least within the average range (approximately greater than the 2.3rd percentile), and there is marked impairment in functional language (spoken or signed) relative to the individual's age, with the individual not able to use more than single words or simple phrases for instrumental purposes, such as to express personal needs and desires.

**6A02.3**                    **Autism spectrum disorder with disorder of intellectual development and with impaired functional language**

All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is marked impairment in functional language (spoken or signed) relative to the individual's age, with the individual not able to use more than single words or simple phrases for instrumental purposes, such as to express personal needs and desires.

- 6A02.5 Autism spectrum disorder with disorder of intellectual development and with absence of functional language**  
All definitional requirements for both autism spectrum disorder and disorder of intellectual development are met and there is complete, or almost complete, absence of ability relative to the individual's age to use functional language (spoken or signed) for instrumental purposes, such as to express personal needs and desires
- 6A02.Y Other specified autism spectrum disorder**
- 6A02.Z Autism spectrum disorder, unspecified**
- 6A03 Developmental learning disorder**  
Developmental learning disorder is characterised by significant and persistent difficulties in learning academic skills, which may include reading, writing, or arithmetic. The individual's performance in the affected academic skill(s) is markedly below what would be expected for chronological age and general level of intellectual functioning, and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder first manifests when academic skills are taught during the early school years. Developmental learning disorder is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological or motor disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:** Symbolic dysfunctions (MB4B)
- 6A03.0 Developmental learning disorder with impairment in reading**  
Developmental learning disorder with impairment in reading is characterised by significant and persistent difficulties in learning academic skills related to reading, such as word reading accuracy, reading fluency, and reading comprehension. The individual's performance in reading is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in reading is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:** Disorders of intellectual development (6A00)

- 6A03.1 Developmental learning disorder with impairment in written expression**
- Developmental learning disorder with impairment in written expression is characterised by significant and persistent difficulties in learning academic skills related to writing, such as spelling accuracy, grammar and punctuation accuracy, and organisation and coherence of ideas in writing. The individual's performance in written expression is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in written expression is not due to a disorder of intellectual development, sensory impairment (vision or hearing), a neurological or motor disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:** Disorders of intellectual development (6A00)
- 6A03.2 Developmental learning disorder with impairment in mathematics**
- Developmental learning disorder with impairment in mathematics is characterised by significant and persistent difficulties in learning academic skills related to mathematics or arithmetic, such as number sense, memorization of number facts, accurate calculation, fluent calculation, and accurate mathematic reasoning. The individual's performance in mathematics or arithmetic is markedly below what would be expected for chronological or developmental age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with impairment in mathematics is not due to a disorder of intellectual development, sensory impairment (vision or hearing), a neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:** Disorders of intellectual development (6A00)
- 6A03.3 Developmental learning disorder with other specified impairment of learning**
- Developmental learning disorder with other specified impairment of learning is characterised by significant and persistent difficulties in learning academic skills other than reading, mathematics, and written expression. The individual's performance in the relevant academic skill is markedly below what would be expected for chronological age and level of intellectual functioning and results in significant impairment in the individual's academic or occupational functioning. Developmental learning disorder with other specified impairment of learning is not due to a disorder of intellectual development, sensory impairment (vision or hearing), neurological disorder, lack of availability of education, lack of proficiency in the language of academic instruction, or psychosocial adversity.
- Exclusions:** Disorders of intellectual development (6A00)
- 6A03.Z Developmental learning disorder, unspecified**

**6A04****Developmental motor coordination disorder**

Developmental motor coordination disorder is characterised by a significant delay in the acquisition of gross and fine motor skills and impairment in the execution of coordinated motor skills that manifest in clumsiness, slowness, or inaccuracy of motor performance. Coordinated motor skills are markedly below that expected given the individual's chronological age and level of intellectual functioning. Onset of coordinated motor skills difficulties occurs during the developmental period and is typically apparent from early childhood. Coordinated motor skills difficulties cause significant and persistent limitations in functioning (e.g. in activities of daily living, school work, and vocational and leisure activities). Difficulties with coordinated motor skills are not solely attributable to a Disease of the Nervous System, Disease of the Musculoskeletal System or Connective Tissue, sensory impairment, and not better explained by a Disorder of Intellectual Development.

**Exclusions:**

- Abnormalities of gait and mobility (MB44)
- Diseases of the musculoskeletal system or connective tissue (Chapter 15)
- Diseases of the nervous system (Chapter 08)

**6A05****Attention deficit hyperactivity disorder**

Attention deficit hyperactivity disorder is characterised by a persistent pattern (at least 6 months) of inattention and/or hyperactivity-impulsivity that has a direct negative impact on academic, occupational, or social functioning. There is evidence of significant inattention and/or hyperactivity-impulsivity symptoms prior to age 12, typically by early to mid-childhood, though some individuals may first come to clinical attention later. The degree of inattention and hyperactivity-impulsivity is outside the limits of normal variation expected for age and level of intellectual functioning. Inattention refers to significant difficulty in sustaining attention to tasks that do not provide a high level of stimulation or frequent rewards, distractibility and problems with organisation. Hyperactivity refers to excessive motor activity and difficulties with remaining still, most evident in structured situations that require behavioural self-control. Impulsivity is a tendency to act in response to immediate stimuli, without deliberation or consideration of the risks and consequences. The relative balance and the specific manifestations of inattentive and hyperactive-impulsive characteristics varies across individuals and may change over the course of development. In order for a diagnosis to be made, manifestations of inattention and/or hyperactivity-impulsivity must be evident across multiple situations or settings (e.g., home, school, work, with friends or relatives), but are likely to vary according to the structure and demands of the setting. Symptoms are not better accounted for by another mental, behavioural, or neurodevelopmental disorder and are not due to the effect of a substance or medication.

**Inclusions:**

- attention deficit disorder with hyperactivity
- attention deficit syndrome with hyperactivity

|               |                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|               | This category should be applied to forms of Stereotyped movement disorder in which stereotyped behaviours result in self-inflicted bodily injury that is significant enough to require medical treatment, or would result in such injury if protective measures (e.g., helmet to prevent head injury) were not employed. Stereotyped movement disorder with self-injury is characterised by voluntary, repetitive, stereotyped, apparently purposeless (and often rhythmic) movements that arise during the early developmental period, are not caused by the direct physiological effects of a substance or medication (including withdrawal). Stereotyped movements that are self-injurious can include head banging, face slapping, eye poking, and biting of the hands, lips, or other body parts. |

## Schizophrenia or other primary psychotic disorders (6A20-6A2Z)

Schizophrenia and other primary psychotic disorders are characterised by significant impairments in reality testing and alterations in behaviour manifest in positive symptoms such as persistent delusions, persistent hallucinations, disorganised thinking (typically manifest as disorganised speech), grossly disorganised behaviour, and experiences of passivity and control, negative symptoms such as blunted or flat affect and avolition, and psychomotor disturbances. The symptoms occur with sufficient frequency and intensity to deviate from expected cultural or subcultural norms. These symptoms do not arise as a feature of another mental and behavioural disorder (e.g., a mood disorder, delirium, or a disorder due to substance use). The categories in this grouping should not be used to classify the expression of ideas, beliefs, or behaviours that are culturally sanctioned.

**Coded Elsewhere:** Substance-induced psychotic disorders

Secondary psychotic syndrome (6E61)

### 6A20

#### Schizophrenia

Schizophrenia is characterised by disturbances in multiple mental modalities, including thinking (e.g., delusions, disorganisation in the form of thought), perception (e.g., hallucinations), self-experience (e.g., the experience that one's feelings, impulses, thoughts, or behaviour are under the control of an external force), cognition (e.g., impaired attention, verbal memory, and social cognition), volition (e.g., loss of motivation), affect (e.g., blunted emotional expression), and behaviour (e.g., behaviour that appears bizarre or purposeless, unpredictable or inappropriate emotional responses that interfere with the organisation of behaviour). Psychomotor disturbances, including catatonia, may be present. Persistent delusions, persistent hallucinations, thought disorder, and experiences of influence, passivity, or control are considered core symptoms. Symptoms must have persisted for at least one month in order for a diagnosis of schizophrenia to be assigned. The symptoms are not a manifestation of another health condition (e.g., a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g., corticosteroids), including withdrawal (e.g., alcohol withdrawal).

**Exclusions:** Schizotypal disorder (6A22)  
schizophrenic reaction (6A22)  
Acute and transient psychotic disorder (6A23)

#### 6A20.0

##### Schizophrenia, first episode

Schizophrenia, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizophrenia (including duration) but who have never before experienced an episode during which diagnostic requirements for Schizophrenia were met.

#### 6A20.00

Schizophrenia, first episode, currently symptomatic

All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.

- 6A20.01** Schizophrenia, first episode, in partial remission  
All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A20.02** Schizophrenia, first episode, in full remission  
All definitional requirements for Schizophrenia, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A20.0Z** Schizophrenia, first episode, unspecified
- 6A20.1** **Schizophrenia, multiple episodes**  
Schizophrenia, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizophrenia and who have also previously experienced episodes during which diagnostic requirements were met, with substantial remission of symptoms between episodes. Some attenuated symptoms may remain during periods of remission, and remissions may have occurred in response to medication or other treatment.
- 6A20.10** Schizophrenia, multiple episodes, currently symptomatic  
All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A20.11** Schizophrenia, multiple episodes, in partial remission  
All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A20.12** Schizophrenia, multiple episodes, in full remission  
All definitional requirements for Schizophrenia, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A20.1Z** Schizophrenia, multiple episodes, unspecified
- 6A20.2** **Schizophrenia, continuous**  
Symptoms fulfilling all definitional requirements of Schizophrenia have been present for almost all of the illness course over a period of at least one year, with periods of subthreshold symptoms being very brief relative to the overall course.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>6A21</b>    | <b>Schizoaffective disorder</b><br>Schizoaffective disorder is an episodic disorder in which the diagnostic requirements of schizophrenia and a manic, mixed, or moderate or severe depressive episode are met within the same episode of illness, either simultaneously or within a few days of each other. Prominent symptoms of schizophrenia (e.g. delusions, hallucinations, disorganisation in the form of thought, experiences of influence, passivity and control) are accompanied by typical symptoms of a moderate or severe depressive episode (e.g. depressed mood, loss of interest, reduced energy), a manic episode (e.g. an extreme mood state characterised by euphoria, irritability, or expansiveness; increased activity or a subjective experience of increased energy) or a mixed episode. Psychomotor disturbances, including catatonia, may be present. Symptoms must have persisted for at least one month. The symptoms are not a manifestation of another medical condition (e.g. a brain tumor) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal (e.g. alcohol withdrawal). |
| <b>6A21.0</b>  | <b>Schizoaffective disorder, first episode</b><br>Schizoaffective disorder, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizoaffective disorder (including duration) but who have never before experienced an episode during which diagnostic requirements for Schizoaffective disorder or Schizophrenia were met.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

- 6A21.00** Schizoaffective disorder, first episode, currently symptomatic  
All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A21.01** Schizoaffective disorder, first episode, in partial remission  
All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A21.02** Schizoaffective disorder, first episode, in full remission  
All definitional requirements for Schizoaffective disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A21.0Z** Schizoaffective disorder, first episode, unspecified
