- 6A21.1** **Schizoaffective disorder, multiple episodes**  
Schizoaffective disorder, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for Schizoaffective disorder and who have also previously experienced episodes during which diagnostic requirements for Schizoaffective disorder or Schizophrenia were met, with substantial remission of symptoms between episodes. Some attenuated symptoms may remain during period of remission, and remissions may have occurred in response to medication or other treatment.
- 6A21.10** Schizoaffective disorder, multiple episodes, currently symptomatic  
All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.
- 6A21.11** Schizoaffective disorder, multiple episodes, in partial remission  
All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.
- 6A21.12** Schizoaffective disorder, multiple episodes, in full remission  
All definitional requirements for Schizoaffective disorder, multiple episodes in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.
- 6A21.1Z** Schizoaffective disorder, multiple episodes, unspecified

| <b>6A22</b>    | <b>Schizotypal disorder</b><br>Schizotypal disorder is characterised by an enduring pattern (i.e. characteristic of the person's functioning over a period of at least several years) of eccentricities in behaviour, appearance and speech, accompanied by cognitive and perceptual distortions, unusual beliefs, and discomfort with— and often reduced capacity for— interpersonal relationships. Symptoms may include constricted or inappropriate affect and anhedonia. Paranoid ideas, ideas of reference, or other psychotic symptoms, including hallucinations in any modality, may occur, but are not of sufficient intensity or duration to meet the diagnostic requirements of schizophrenia, schizoaffective disorder, or delusional disorder. The symptoms cause distress or impairment in personal, family, social, educational, occupational or other important areas of functioning.<br><br><b>Inclusions:</b> Schizotypal personality disorder<br><b>Exclusions:</b> Autism spectrum disorder (6A02)<br>Personality disorder (6D10) |

**6A23****Acute and transient psychotic disorder**

Acute and transient psychotic disorder is characterised by acute onset of psychotic symptoms that emerge without a prodrome and reach their maximal severity within two weeks. Symptoms may include delusions, hallucinations, disorganisation of thought processes, perplexity or confusion, and disturbances of affect and mood. Catatonia-like psychomotor disturbances may be present. Symptoms typically change rapidly, both in nature and intensity, from day to day, or even within a single day. The duration of the episode does not exceed 3 months, and most commonly lasts from a few days to 1 month. The symptoms are not a manifestation of another medical condition (e.g. a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal (e.g. alcohol withdrawal).

**6A23.0****Acute and transient psychotic disorder, first episode**

Acute and transient psychotic disorder, first episode should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for acute and transient psychotic disorder but who have never before experienced a similar episode.

**6A23.00**

Acute and transient psychotic disorder, first episode, currently symptomatic

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration are currently met, or have been met within the past one month.

**6A23.01**

Acute and transient psychotic disorder, first episode, in partial remission

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.

**6A23.02**

Acute and transient psychotic disorder, first episode, in full remission

All definitional requirements for Acute and transient psychotic disorder, first episode in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

**6A23.0Z**

Acute and transient psychotic disorder, first episode, unspecified

**6A23.1****Acute and transient psychotic disorder, multiple episodes**

Acute and transient psychotic disorder, multiple episodes should be used to identify individuals experiencing symptoms that meet the diagnostic requirements for acute and transient psychotic disorder and who have experienced similar episodes in the past.

**6A23.10**

Acute and transient psychotic disorder, multiple episodes, currently symptomatic

All definitional requirements for Acute and transient psychotic disorder, multiple episodes in terms of symptoms and duration are currently met, or have been met within the past one month.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>6A24</b>    | <p><b>Delusional disorder</b></p> <p>Delusional disorder is characterised by the development of a delusion or set of related delusions, typically persisting for at least 3 months and often much longer, in the absence of a Depressive, Manic, or Mixed mood episode. The delusions are variable in content across individuals, but typically stable within individuals, although they may evolve over time. Other characteristic symptoms of Schizophrenia (i.e. clear and persistent hallucinations, negative symptoms, disorganised thinking, or experiences of influence, passivity, or control) are not present, although various forms of perceptual disturbances (e.g. hallucinations, illusions, misidentifications of persons) thematically related to the delusion are still consistent with the diagnosis. Apart from actions and attitudes directly related to the delusion or delusional system, affect, speech, and behavior are typically unaffected. The symptoms are not a manifestation of another medical condition (e.g., a brain tumour) and are not due to the effect of a substance or medication on the central nervous system (e.g. corticosteroids), including withdrawal effects (e.g. alcohol withdrawal).</p> |
| <b>6A24.0</b>  | <p><b>Delusional disorder, currently symptomatic</b></p> <p>All definitional requirements for Delusional disorder in terms of symptoms and duration are currently met, or have been met within the past one month.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>6A24.1</b>  | <p><b>Delusional disorder, in partial remission</b></p> <p>All definitional requirements for Delusional disorder in terms of symptoms and duration were previously met. Symptoms have ameliorated such that the diagnostic requirements for the disorder have not been met for at least one month, but some clinically significant symptoms remain, which may or may not be associated with functional impairment. The partial remission may have occurred in response to medication or other treatment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**6A24.2 Delusional disorder, in full remission**

All definitional requirements for Delusional disorder in terms of symptoms and duration were previously met. Symptoms have ameliorated such that no significant symptoms remain. The remission may have occurred in response to medication or other treatment.

**6A24.Z Delusional disorder, unspecified**

**6A25**

**Symptomatic manifestations of primary psychotic disorders**

These categories may be used to characterize the current clinical presentation in individuals diagnosed with Schizophrenia or another primary psychotic disorder, and should not be used in individuals without such a diagnosis. Multiple categories may be applied. Symptoms attributable to the direct pathophysiological consequences of a health condition or injury not classified under Mental, behavioural or neurodevelopmental disorders (e.g., a brain tumour or traumatic brain injury), or to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, should not be considered as examples of the respective types of symptoms.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**6A25.0 Positive symptoms in primary psychotic disorders**

Positive symptoms in primary psychotic disorders include persistent delusions, persistent hallucinations (most commonly verbal auditory hallucinations), disorganised thinking (formal thought disorder such as loose associations, thought derailment, or incoherence), grossly disorganised behaviour (behaviour that appears bizarre, purposeless and not goal-directed) and experiences of passivity and control (the experience that one's feelings, impulses, or thoughts are under the control of an external force). The rating should be made based on the severity of positive symptoms during the past week.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**6A25.1 Negative symptoms in primary psychotic disorders**

Negative symptoms in primary psychotic disorders include constricted, blunted, or flat affect, alogia or paucity of speech, avolition (general lack of drive, or lack of motivation to pursue meaningful goals), asociality (reduced or absent engagement with others and interest in social interaction) and anhedonia (inability to experience pleasure from normally pleasurable activities). To be considered negative psychotic symptoms, relevant symptoms should not be entirely attributable to antipsychotic drug treatment, a depressive disorder, or an under-stimulating environment, and should not be a direct consequence of a positive symptom (e.g., persecutory delusions causing a person to become socially isolated due to fear of harm). The rating should be made based on the severity of negative symptoms during the past week.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**6A25.2 Depressive mood symptoms in primary psychotic disorders**

Depressive mood symptoms in primary psychotic disorders refer to depressed mood as reported by the individual (feeling down, sad) or manifested as a sign (e.g. tearful, defeated appearance). If only non-mood symptoms of a depressive episode are present (e.g., anhedonia, psychomotor slowing), this descriptor should not be used. This descriptor may be used whether or not depressive symptoms meet the diagnostic requirements of a separately diagnosed Depressive disorder. The rating should be made based on the severity of depressive mood symptoms during the past week.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**6A25.3 Manic mood symptoms in primary psychotic disorders**

Manic mood symptoms in primary psychotic disorders refer to elevated, euphoric, irritable, or expansive mood states, including rapid changes among different mood states (i.e., mood lability). It also includes increased subjective experience of energy, which may be accompanied by increased goal-directed activity. The severity of associated non-mood symptoms of a Manic or Hypomanic Episode (e.g., decreased need for sleep, distractibility) should not be considered in making a rating. Increased non-goal-directed psychomotor activity should be considered as part of the rating of the 'psychomotor symptoms in primary psychotic disorders' rather than here. This descriptor may be used whether or not the manic symptoms meet the diagnostic requirements of a separately diagnosed bipolar disorder. The rating should be made based on the severity of manic mood symptoms during the past week.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**6A25.4 Psychomotor symptoms in primary psychotic disorders**

Psychomotor symptoms in primary psychotic disorders include psychomotor agitation or excessive motor activity, usually manifested by purposeless behaviours such as fidgeting, shifting, fiddling, inability to sit or stand still, wringing of the hands, psychomotor retardation, or a visible generalised slowing of movements and speech, and catatonic symptoms such as excitement, posturing, waxy flexibility, negativism, mutism, or stupor. The rating should be made based on the severity of psychomotor symptoms during the past week.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**6A25.5 Cognitive symptoms in primary psychotic disorders**

Cognitive symptoms in primary psychotic disorders refer to cognitive impairment in any of the following domains: speed of processing, attention/concentration, orientation, judgment, abstraction, verbal or visual learning, and working memory. The cognitive impairment is not attributable to a neurodevelopmental disorder, a delirium or other neurocognitive disorder, or the direct effects of a substance or medication on the central nervous system, including withdrawal effects. Ideally, use of this category should be based on the results of locally validated, standardized neuropsychological assessments, although such measures may not be available in all settings. The rating should be made based on the severity of cognitive symptoms during the past week.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of these symptoms in primary psychotic disorders.

**Exclusions:** Neurocognitive disorders (6D70-6E0Z)

Neurodevelopmental disorders (6A00-6A0Z)

**6A2Y Other specified primary psychotic disorder****6A2Z Schizophrenia or other primary psychotic disorders, unspecified****Catatonia (6A40-6A4Z)**

Catatonia is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity. The assessment of catatonia is complex and requires observation, interview and physical exam. Catatonia can occur in the context of another mental disorder, such as Schizophrenia or Other Primary Psychotic Disorders, Mood Disorders, and Neurodevelopmental Disorders, especially Autism Spectrum Disorder. Catatonia can also develop during or soon after intoxication or withdrawal from certain psychoactive substances, including phencyclidine (PCP), cannabis, hallucinogens such as mescaline or LSD, cocaine and MDMA or related drugs, or during the use of certain psychoactive and non-psychoactive medications (e.g. antipsychotic medications, benzodiazepines, steroids, disulfiram, ciprofloxacin). Finally, Catatonia can occur as a direct pathophysiological consequence of a medical condition not classified under Mental, Behavioural or Neurodevelopmental Disorders. Examples of medical conditions that may be associated with Catatonia include diabetic ketoacidosis, hypercalcemia, hepatic encephalopathy, homocystinuria, neoplasms head trauma, cerebrovascular disease, and encephalitis.

**Exclusions:** Harmful effects of drugs, medicaments or biological substances, not elsewhere classified (NE60)

**Coded Elsewhere:** Secondary catatonia syndrome (6E69)

**6A40 Catatonia associated with another mental disorder**

Catatonia associated with another mental disorder is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity, which occurs in the context of another mental disorder, such as Schizophrenia or Other Primary Psychotic Disorders, Mood Disorders, and Neurodevelopmental Disorders, especially Autism Spectrum Disorder.

**6A41****Catatonia induced by substances or medications**

Catatonia induced by substances or medications is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity, which develops during or soon after intoxication or withdrawal from certain psychoactive substances, including phencyclidine (PCP), cannabis, hallucinogens such as mescaline or LSD, cocaine and MDMA or related drugs, or during the use of certain psychoactive and non-psychoactive medications (e.g. antipsychotic medications, benzodiazepines, steroids, disulfiram, ciprofloxacin).

**Exclusions:**           Neuroleptic malignant syndrome (8A00-8A0Z)  
                              Serotonin syndrome (8D85)

**6A4Z****Catatonia, unspecified**

**Coding Note:**   Code also the causing condition

## Mood disorders (6A60-6A8Z)

Mood Disorders refers to a superordinate grouping of Bipolar and Depressive Disorders. Mood disorders are defined according to particular types of mood episodes and their pattern over time. The primary types of mood episodes are Depressive episode, Manic episode, Mixed episode, and Hypomanic episode. Mood episodes are not independently diagnosable entities, and therefore do not have their own diagnostic codes. Rather, mood episodes make up the primary components of most of the Depressive and Bipolar Disorders.

**Coded Elsewhere:** Substance-induced mood disorders  
Secondary mood syndrome (6E62)

### Bipolar or related disorders (6A60-6A6Z)

Bipolar and related disorders are episodic mood disorders defined by the occurrence of Manic, Mixed or Hypomanic episodes or symptoms. These episodes typically alternate over the course of these disorders with Depressive episodes or periods of depressive symptoms.

#### 6A60

#### **Bipolar type I disorder**

Bipolar type I disorder is an episodic mood disorder defined by the occurrence of one or more manic or mixed episodes. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. Although the diagnosis can be made based on evidence of a single manic or mixed episode, typically manic or mixed episodes alternate with depressive episodes over the course of the disorder.

**Exclusions:** Cyclothymia (6A62)  
Bipolar type II disorder (6A61)

**6A60.0****Bipolar type I disorder, current episode manic, without psychotic symptoms**

Bipolar type I disorder, current episode manic, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met, the current episode is manic, and there are no delusions or hallucinations present during the episode. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). If the individual has experienced Manic or Mixed Episodes in the past, a duration of one week is not required in order to diagnose a current episode if all other diagnostic requirements are met.

**6A60.1****Bipolar type I disorder, current episode manic, with psychotic symptoms**

Bipolar type I disorder, current episode manic with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I Disorder have been met, the current episode is Manic and there are delusions or hallucinations present during the episode. A manic episode is an extreme mood state lasting at least one week unless shortened by a treatment intervention characterised by euphoria, irritability, or expansiveness, and by increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid or pressured speech, flight of ideas, increased self-esteem or grandiosity, decreased need for sleep, distractibility, impulsive or reckless behaviour, and rapid changes among different mood states (i.e., mood lability). If the individual has experienced Manic or Mixed Episodes in the past, a duration of one week is not required in order to diagnose a current episode if all other diagnostic requirements are met.

**6A60.2****Bipolar type I disorder, current episode hypomanic**

Bipolar type I disorder, current episode hypomanic is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is hypomanic. A hypomanic episode is a persistent mood state lasting at least several days characterised by mild elevation of mood or increased irritability and increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid speech, rapid or racing thoughts, increased self-esteem, an increase in sexual drive or sociability, decreased need for sleep, distractibility, or impulsive or reckless behaviour. The symptoms are not severe enough to cause marked impairment in occupational functioning or in usual social activities or relationships with others, does not necessitate hospitalization, and there are no accompanying delusions or hallucinations.

**6A60.3****Bipolar type I disorder, current episode depressive, mild**

Bipolar type I disorder, current episode depressive, mild is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a mild level of severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

**6A60.4****Bipolar type I disorder, current episode depressive, moderate without psychotic symptoms**

Bipolar type I disorder, current episode depressive, moderate, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a moderate level of severity and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A60.5****Bipolar type I disorder, current episode depressive, moderate with psychotic symptoms**

Bipolar type I disorder, current episode depressive, moderate, with psychotic symptoms diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive at a moderate level of severity and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

- 6A60.6 Bipolar type I disorder, current episode depressive, severe without psychotic symptoms**
- Bipolar type I disorder, current episode depressive, severe, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).
- 6A60.7 Bipolar type I disorder, current episode depressive, severe with psychotic symptoms**
- Bipolar type I disorder, current episode depressive, severe, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).
- 6A60.8 Bipolar type I disorder, current episode depressive, unspecified severity**
- Bipolar type I disorder, current episode depressive, unspecified severity is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the current episode is depressive, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

- 6A60.9 Bipolar type I disorder, current episode mixed, without psychotic symptoms**  
 Bipolar type I disorder, current episode mixed, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is mixed and there are no delusions or hallucinations present during the episode. A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. If the individual has experienced Manic or Mixed Episodes in the past, a duration of 2 weeks is not required in order to diagnose a current episode if all other diagnostic requirements are met.
- 6A60.A Bipolar type I disorder, current episode mixed, with psychotic symptoms**  
 Bipolar type I disorder, current episode mixed, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type I disorder are met and the current episode is mixed and there are delusions or hallucinations present during the episode. A mixed episode is characterised by the presence of several prominent manic and several prominent depressive symptoms consistent with those observed in manic episodes and depressive episodes, which either occur simultaneously or alternate very rapidly (from day to day or within the same day). Symptoms must include an altered mood state consistent with a manic and/or depressive episode (i.e., depressed, dysphoric, euphoric or expansive mood), and be present most of the day, nearly every day, during a period of at least 2 weeks, unless shortened by a treatment intervention. If the individual has experienced Manic or Mixed Episodes in the past, a duration of 2 weeks is not required in order to diagnose a current episode if all other diagnostic requirements are met.
- 6A60.B Bipolar type I disorder, currently in partial remission, most recent episode manic or hypomanic**  
 Bipolar type I disorder, currently in partial remission, most recent episode manic or hypomanic is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a manic or hypomanic episode. The full definitional requirements for a manic or hypomanic episode are no longer met but some significant mood symptoms remain. In some cases, residual mood symptoms may be depressive rather than manic or hypomanic, but do not satisfy the definitional requirements for a depressive episode.
- 6A60.C Bipolar type I disorder, currently in partial remission, most recent episode depressive**  
 Bipolar type I disorder, currently in partial remission, most recent episode depressive is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a depressive episode. The full definitional requirements for the episode are no longer met but some significant depressive symptoms remain.

- 6A60.D Bipolar type I disorder, currently in partial remission, most recent episode mixed**
- Bipolar type I disorder, currently in partial remission, most recent episode mixed is diagnosed when the definitional requirements for Bipolar type I disorder have been met and the most recent episode was a mixed episode. The full definitional requirements for the episode are no longer met but some significant mood symptoms remain.
- 6A60.E Bipolar type I disorder, currently in partial remission, most recent episode unspecified**
- Bipolar type I disorder, currently in partial remission, most recent episode unspecified is diagnosed when the definitional requirements for Bipolar type I disorder have been met but there is insufficient information to determine the nature of the most recent mood episode. The full definitional requirements for a mood episode are no longer met but some significant mood symptoms remain.
- 6A60.F Bipolar type I disorder, currently in full remission**
- Bipolar type I disorder, currently in full remission is diagnosed when the full definitional requirements for Bipolar I disorder have been met in the past but there are no longer any significant mood symptoms.
- 6A60.Y Other specified bipolar type I disorder**
- 6A60.Z Bipolar type I disorder, unspecified**
- 6A61 Bipolar type II disorder**
- Bipolar type II disorder is an episodic mood disorder defined by the occurrence of one or more hypomanic episodes and at least one depressive episode. A hypomanic episode is a persistent mood state lasting for at least several days characterised by persistent elevation of mood or increased irritability as well as increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as increased talkativeness, rapid or racing thoughts, increased self-esteem, decreased need for sleep, distractability, and impulsive or reckless behavior. The symptoms represent a change from the individual's typical mood, energy level, and behavior but are not severe enough to cause marked impairment in functioning. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as changes in appetite or sleep, psychomotor agitation or retardation, fatigue, feelings of worthless or excessive or inappropriate guilt, feelings or hopelessness, difficulty concentrating, and suicidality. There is no history of manic or mixed episodes.

**6A61.0****Bipolar type II disorder, current episode hypomanic**

Bipolar type II disorder, current episode hypomanic is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is hypomanic. A hypomanic episode is a persistent mood state lasting at least several days characterised by mild elevation of mood or increased irritability and increased activity or a subjective experience of increased energy, accompanied by other characteristic symptoms such as rapid speech, rapid or racing thoughts, increased self-esteem, an increase in sexual drive or sociability, decreased need for sleep, distractibility, or impulsive or reckless behaviour. The symptoms are not severe enough to cause marked impairment in occupational functioning or in usual social activities or relationships with others, does not necessitate hospitalization, and there are no accompanying delusions or hallucinations.

**6A61.1****Bipolar type II disorder, current episode depressive, mild**

Bipolar type II disorder, current episode depressive, mild is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a mild level of severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

**6A61.2****Bipolar type II disorder, current episode depressive, moderate without psychotic symptoms**

Bipolar type II disorder, current episode depressive, moderate, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a moderate level of severity and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

- 6A61.3 Bipolar type II disorder, current episode depressive, moderate with psychotic symptoms**
- Bipolar type II disorder, current episode depressive, moderate, with psychotic symptoms diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive at a moderate level of severity and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).
- 6A61.4 Bipolar type II disorder, current episode depressive, severe without psychotic symptoms**
- Bipolar type II disorder, current episode depressive, severe, without psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).
- 6A61.5 Bipolar type II disorder, current episode depressive, severe with psychotic symptoms**
- Bipolar type II disorder, current episode depressive, severe, with psychotic symptoms is diagnosed when the definitional requirements for Bipolar type II disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>6A61.6</b> | <p><b>Bipolar type II disorder, current episode depressive, unspecified severity</b></p> <p>Bipolar type II disorder, current episode depressive, unspecified severity is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the current episode is depressive, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.</p> |
| <b>6A61.7</b> | <p><b>Bipolar type II disorder, currently in partial remission, most recent episode hypomanic</b></p> <p>Bipolar type II disorder, currently in partial remission, most recent episode hypomanic is diagnosed when the definitional requirements for Bipolar type II disorder have been met and the most recent episode was a hypomanic episode. The full definitional requirements for a hypomanic episode are no longer met but some significant mood symptoms remain. In some cases, residual mood symptoms may be depressive rather than hypomanic, but do not satisfy the definitional requirements for a depressive episode.</p>                                                                                                                                                                                                                                                                                                                                                                                              |

**6A62****Cyclothymic disorder**

Cyclothymic disorder is characterised by a persistent instability of mood over a period of at least 2 years, involving numerous periods of hypomanic (e.g., euphoria, irritability, or expansiveness, psychomotor activation) and depressive (e.g., feeling down, diminished interest in activities, fatigue) symptoms that are present during more of the time than not. The hypomanic symptomatology may or may not be sufficiently severe or prolonged to meet the full definitional requirements of a hypomanic episode (see Bipolar type II disorder), but there is no history of manic or mixed episodes (see Bipolar type I disorder). The depressive symptomatology has never been sufficiently severe or prolonged to meet the diagnostic requirements for a depressive episode (see Bipolar type II disorder). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:** Cycloid personality  
Cyclothymic personality

**6A6Y****Other specified bipolar or related disorders****6A6Z****Bipolar or related disorders, unspecified**

## Depressive disorders (6A70-6A7Z)

Depressive disorders are characterised by depressive mood (e.g., sad, irritable, empty) or loss of pleasure accompanied by other cognitive, behavioural, or neurovegetative symptoms that significantly affect the individual's ability to function. A depressive disorder should not be diagnosed in individuals who have ever experienced a manic, mixed or hypomanic episode, which would indicate the presence of a bipolar disorder.

**Coded Elsewhere:** Premenstrual dysphoric disorder (GA34.41)

**6A70****Single episode depressive disorder**

Single episode depressive disorder is characterised by the presence or history of one depressive episode when there is no history of prior depressive episodes. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. There have never been any prior manic, hypomanic, or mixed episodes, which would indicate the presence of a bipolar disorder.

**Exclusions:** recurrent depressive disorder (6A71)  
Adjustment disorder (6B43)  
Bipolar or related disorders (6A60-6A6Z)

**6A70.0      Single episode depressive disorder, mild**

Single episode depressive disorder, mild, is diagnosed when the definitional requirements of a Depressive episode are met and the episode is of mild severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.

**6A70.1      Single episode depressive disorder, moderate, without psychotic symptoms**

Single episode depressive disorder, moderate, without psychotic symptoms is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, the episode is of moderate severity, and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A70.2      Single episode depressive disorder, moderate, with psychotic symptoms**

Single episode depressive disorder, moderate, with psychotic symptoms is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, the episode is of moderate severity, and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A70.3****Single episode depressive disorder, severe, without psychotic symptoms**

Single episode depressive disorder, severe, without psychotic symptoms is diagnosed when the definitional requirements for Single episode depressive disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**Inclusions:**

Major depression single episode without psychotic symptoms

Vital depression single episode without psychotic symptoms

**6A70.4****Single episode depressive disorder, severe, with psychotic symptoms**

Single episode depressive disorder, severe, with psychotic symptoms is diagnosed when the definitional requirements for Single episode depressive disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains). In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**6A70.5****Single episode depressive disorder, unspecified severity**

Single episode depressive disorder, unspecified severity is diagnosed when the definitional requirements of a depressive episode have been met, there is no history of prior depressive episodes, and there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.

| <b>6A71</b>   | <p><b>Recurrent depressive disorder</b></p> <p>Recurrent depressive disorder is characterised by a history of at least two depressive episodes separated by at least several months without significant mood disturbance. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. There have never been any prior manic, hypomanic, or mixed episodes, which would indicate the presence of a Bipolar disorder.</p> <p><b>Inclusions:</b> seasonal depressive disorder</p> <p><b>Exclusions:</b> Adjustment disorder (6B43)</p> <p>Bipolar or related disorders (6A60-6A6Z)</p> <p>Single episode depressive disorder (6A70)</p>                               |
| <b>6A71.0</b> | <p><b>Recurrent depressive disorder, current episode mild</b></p> <p>Recurrent depressive disorder, current episode mild is diagnosed when the definitional requirements for Recurrent depressive disorder have been met and there is currently a depressive episode of mild severity. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a mild depressive episode, the individual is usually distressed by the symptoms and has some difficulty in continuing to function in one or more domains (personal, family, social, educational, occupational, or other important domains). There are no delusions or hallucinations during the episode.</p> |

**6A71.1      Recurrent depressive disorder, current episode moderate, without psychotic symptoms**

Recurrent depressive disorder, current episode moderate, without psychotic symptoms is diagnosed when the definitional requirements for recurrent depressive disorder have been met and there is currently a depressive episode of moderate severity, and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A71.2      Recurrent depressive disorder, current episode moderate, with psychotic symptoms**

Recurrent depressive disorder, current episode moderate, with psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder have been met and there is currently a depressive episode of moderate severity, and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a moderate depressive episode, several symptoms of a depressive episode are present to a marked degree, or a large number of depressive symptoms of lesser severity are present overall. The individual typically has considerable difficulty functioning in multiple domains (personal, family, social, educational, occupational, or other important domains).

**6A71.3****Recurrent depressive disorder, current episode severe, without psychotic symptoms**

Recurrent depressive disorder, current episode severe, without psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder are met and the current episode is severe and there are no delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**Inclusions:**

Endogenous depression without psychotic symptoms

Major depression, recurrent without psychotic symptoms

Manic-depressive psychosis, depressed type without psychotic symptoms

Vital depression, recurrent without psychotic symptoms

**6A71.4****Recurrent depressive disorder, current episode severe, with psychotic symptoms**

Recurrent depressive disorder, current episode severe, with psychotic symptoms is diagnosed when the definitional requirements for Recurrent depressive disorder are met and the current episode is severe and there are delusions or hallucinations during the episode. A depressive episode is characterised by a period of depressed mood or diminished interest in activities occurring most of the day, nearly every day during a period lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains). In a severe depressive episode, many or most symptoms of a Depressive Episode are present to a marked degree, or a smaller number of symptoms are present and manifest to an intense degree. The individual has serious difficulty continuing to function in most domains (personal, family, social, educational, occupational, or other important domains).

**Inclusions:**

Endogenous depression with psychotic symptoms

Manic-depressive psychosis, depressed type with psychotic symptoms

| <b>6A71.5</b> | <p><b>Recurrent depressive disorder, current episode, unspecified severity</b></p> <p>Recurrent depressive disorder current episode, unspecified severity is diagnosed when the definitional requirements of a depressive episode have been met and there is a history of prior depressive episodes, but there is insufficient information to determine the severity of the current depressive episode. A depressive episode is characterised by a period of almost daily depressed mood or diminished interest in activities lasting at least two weeks accompanied by other symptoms such as difficulty concentrating, feelings of worthlessness or excessive or inappropriate guilt, hopelessness, recurrent thoughts of death or suicide, changes in appetite or sleep, psychomotor agitation or retardation, and reduced energy or fatigue. The symptoms are associated with at least some difficulty in continuing with ordinary work, social, or domestic activities.</p>                                                           |
| <b>6A71.6</b> | <p><b>Recurrent depressive disorder, currently in partial remission</b></p> <p>Recurrent depressive disorder, currently in partial remission, is diagnosed when the definitional requirements for Recurrent depressive disorder have been met; the full definitional requirements for a depressive episode are no longer met but some significant mood symptoms remain.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>6A71.Z</b> | <b>Recurrent depressive disorder, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>6A72</b>   | <p><b>Dysthymic disorder</b></p> <p>Dysthymic disorder is characterised by a persistent depressive mood (i.e., lasting 2 years or more), for most of the day, for more days than not. In children and adolescents depressed mood can manifest as pervasive irritability. The depressed mood is accompanied by additional symptoms such as markedly diminished interest or pleasure in activities, reduced concentration and attention or indecisiveness, low self-worth or excessive or inappropriate guilt, hopelessness about the future, disturbed sleep or increased sleep, diminished or increased appetite, or low energy or fatigue. During the first 2 years of the disorder, there has never been a 2-week period during which the number and duration of symptoms were sufficient to meet the diagnostic requirements for a Depressive Episode. There is no history of Manic, Mixed, or Hypomanic Episodes.</p> <p><b>Inclusions:</b> Dysthymia</p> <p><b>Exclusions:</b> anxiety depression (mild or not persistent) (6A73)</p> |

**6A73****Mixed depressive and anxiety disorder**

Mixed depressive and anxiety disorder is characterised by symptoms of both anxiety and depression more days than not for a period of two weeks or more. Depressive symptoms include depressed mood or markedly diminished interest or pleasure in activities. There are multiple anxiety symptoms, which may include feeling nervous, anxious, or on edge, not being able to control worrying thoughts, fear that something awful will happen, having trouble relaxing, muscle tension, or sympathetic autonomic symptoms. Neither set of symptoms, considered separately, is sufficiently severe, numerous, or persistent to justify a diagnosis of another depressive disorder or an anxiety or fear-related disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning. There is no history of manic or mixed episodes, which would indicate the presence of a bipolar disorder.

**6A7Y****Other specified depressive disorders****6A7Z****Depressive disorders, unspecified****6A80****Symptomatic and course presentations for mood episodes in mood disorders**

These categories may be applied to describe the presentation and characteristics of mood episodes in the context of single episode depressive disorder, recurrent depressive disorder, bipolar type I disorder, or bipolar type II disorder. These categories indicate the presence of specific, important features of the clinical presentation or of the course, onset, and pattern of mood episodes. These categories are not mutually exclusive, and as many may be added as apply.

**Coding Note:**

These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

**Coded Elsewhere:** Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, without psychotic symptoms (6E20)

Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, with psychotic symptoms (6E21)

**6A80.0****Prominent anxiety symptoms in mood episodes**

In the context of a current depressive, manic, mixed, or hypomanic episode, prominent and clinically significant anxiety symptoms (e.g., feeling nervous, anxious or on edge, not being able to control worrying thoughts, fear that something awful will happen, having trouble relaxing, motor tension, autonomic symptoms) have been present for most of the time during the episode. If there have been panic attacks during a current depressive or mixed episode, these should be recorded separately.

When the diagnostic requirements for both a mood disorder and an anxiety or fear-related disorder are met, the anxiety or fear-related disorder should also be diagnosed.

**Coding Note:**

These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

- 6A80.1      Panic attacks in mood episodes**
- In the context of a current mood episode (manic, depressive, mixed, or hypomanic), there have been recurrent panic attacks (i.e., at least two) during the past month that occur specifically in response to anxiety-provoking cognitions that are features of the mood episode. If panic attacks occur exclusively in response to such thoughts, panic attacks should be recorded using this qualifier rather than assigning an additional co-occurring diagnosis of panic disorder.
- If some panic attacks over the course of the depressive or mixed episode have been unexpected and not exclusively in response to depressive or anxiety-provoking thoughts, a separate diagnosis of panic disorder should be assigned.
- Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.
- Exclusions:**            Panic disorder (6B01)
- 6A80.2      Current depressive episode persistent**
- The diagnostic requirements for a depressive episode are currently met and have been met continuously for at least the past 2 years.
- Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.
- 6A80.3      Current depressive episode with melancholia**
- In the context of a current Depressive Episode, several of the following symptoms have been present during the worst period of the current episode: loss of interest or pleasure in most activities that are normally enjoyable to the individual (i.e., pervasive anhedonia); lack of emotional reactivity to normally pleasurable stimuli or circumstances (i.e., mood does not lift even transiently with exposure); terminal insomnia (i.e., waking in the morning two hours or more before the usual time); depressive symptoms are worse in the morning; marked psychomotor retardation or agitation; marked loss of appetite or loss of weight.
- Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.
- 6A80.4      Seasonal pattern of mood episode onset**
- In the context of recurrent depressive disorder, bipolar type I or bipolar type II disorder, there has been a regular seasonal pattern of onset and remission of at least one type of episode (i.e., depressive, manic, mixed, or hypomanic episodes), with a substantial majority of the relevant mood episodes corresponding to the seasonal pattern. (In bipolar type I and bipolar type II disorder, all types of mood episodes may not follow this pattern.) A seasonal pattern should be differentiated from an episode that is coincidental with a particular season but predominantly related to a psychological stressor that regularly occurs at that time of the year (e.g., seasonal unemployment).
- Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

**6A80.5****Rapid cycling**

In the context of bipolar type I or bipolar type II disorder, there has been a high frequency of mood episodes (at least four) over the past 12 months. There may be a switch from one polarity of mood to the other, or the mood episodes may be demarcated by a period of remission. In individuals with a high frequency of mood episodes, some may have a shorter duration than those usually observed in bipolar type I or bipolar type II disorder. In particular, depressive periods may only last several days. If depressive and manic symptoms alternate very rapidly (i.e., from day to day or within the same day), a mixed episode should be diagnosed rather than rapid cycling.

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify specific clinically important features of mood episodes in mood disorders.

**6A8Y****Other specified mood disorders****6A8Z****Mood disorders, unspecified****Anxiety or fear-related disorders (6B00-6B0Z)**

Anxiety and fear-related disorders are characterised by excessive fear and anxiety and related behavioural disturbances, with symptoms that are severe enough to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Fear and anxiety are closely related phenomena; fear represents a reaction to perceived imminent threat in the present, whereas anxiety is more future-oriented, referring to perceived anticipated threat. A key differentiating feature among the Anxiety and fear-related disorders are disorder-specific foci of apprehension, that is, the stimulus or situation that triggers the fear or anxiety. The clinical presentation of Anxiety and fear-related disorders typically includes specific associated cognitions that can assist in differentiating among the disorders by clarifying the focus of apprehension.

**Coded Elsewhere:** Substance-induced anxiety disorders

Hypochondriasis (6B23)

Secondary anxiety syndrome (6E63)

**6B00****Generalised anxiety disorder**

Generalised anxiety disorder is characterised by marked symptoms of anxiety that persist for at least several months, for more days than not, manifested by either general apprehension (i.e. 'free-floating anxiety') or excessive worry focused on multiple everyday events, most often concerning family, health, finances, and school or work, together with additional symptoms such as muscular tension or motor restlessness, sympathetic autonomic over-activity, subjective experience of nervousness, difficulty maintaining concentration, irritability, or sleep disturbance. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The symptoms are not a manifestation of another health condition and are not due to the effects of a substance or medication on the central nervous system.

**6B01****Panic disorder**

Panic disorder is characterised by recurrent unexpected panic attacks that are not restricted to particular stimuli or situations. Panic attacks are discrete episodes of intense fear or apprehension accompanied by the rapid and concurrent onset of several characteristic symptoms (e.g. palpitations or increased heart rate, sweating, trembling, shortness of breath, chest pain, dizziness or lightheadedness, chills, hot flushes, fear of imminent death). In addition, panic disorder is characterised by persistent concern about the recurrence or significance of panic attacks, or behaviours intended to avoid their recurrence, that results in significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The symptoms are not a manifestation of another medical condition and are not due to the effects of a substance or medication on the central nervous system.

**Exclusions:** Panic attack (MB23.H)

**6B02****Agoraphobia**

Agoraphobia is characterised by marked and excessive fear or anxiety that occurs in response to multiple situations where escape might be difficult or help might not be available, such as using public transportation, being in crowds, being outside the home alone (e.g., in shops, theatres, standing in line). The individual is consistently anxious about these situations due to a fear of specific negative outcomes (e.g., panic attacks, other incapacitating or embarrassing physical symptoms). The situations are actively avoided, entered only under specific circumstances such as in the presence of a trusted companion, or endured with intense fear or anxiety. The symptoms persist for at least several months, and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**6B03****Specific phobia**

Specific phobia is characterised by a marked and excessive fear or anxiety that consistently occurs upon exposure or anticipation of exposure to one or more specific objects or situations (e.g., proximity to certain animals, flying, heights, closed spaces, sight of blood or injury) that is out of proportion to actual danger. The phobic objects or situations are avoided or else endured with intense fear or anxiety. Symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**Inclusions:** Simple phobia

**Exclusions:** Body dysmorphic disorder (6B21)  
Hypochondriasis (6B23)

**6B04****Social anxiety disorder**

Social anxiety disorder is characterised by marked and excessive fear or anxiety that consistently occurs in one or more social situations such as social interactions (e.g. having a conversation), doing something while feeling observed (e.g. eating or drinking in the presence of others), or performing in front of others (e.g. giving a speech). The individual is concerned that he or she will act in a way, or show anxiety symptoms, that will be negatively evaluated by others. Relevant social situations are consistently avoided or else endured with intense fear or anxiety. The symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**6B05****Separation anxiety disorder**

Separation anxiety disorder is characterised by marked and excessive fear or anxiety about separation from specific attachment figures. In children and adolescents, separation anxiety typically focuses on caregivers, parents or other family members and the fear or anxiety is beyond what would be considered developmentally normative. In adults, the focus is typically a romantic partner or children. Manifestations of separation anxiety may include thoughts of harm or untoward events befalling the attachment figure, reluctance to go to school or work, recurrent excessive distress upon separation, reluctance or refusal to sleep away from the attachment figure, and recurrent nightmares about separation. The symptoms persist for at least several months and are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**Exclusions:** mood [affective] disorders (6A60-6A8Z)  
 Selective mutism (6B06)  
 Social anxiety disorder (6B04)

**6B06****Selective mutism**

Selective mutism is characterised by consistent selectivity in speaking, such that a child demonstrates adequate language competence in specific social situations, typically at home, but consistently fails to speak in others, typically at school. The disturbance lasts for at least one month, is not limited to the first month of school, and is of sufficient severity to interfere with educational achievement or with social communication. Failure to speak is not due to a lack of knowledge of, or comfort with, the spoken language required in the social situation (e.g. a different language spoken at school than at home).

**Exclusions:** Schizophrenia (6A20)  
 transient mutism as part of separation anxiety in young children (6B05)  
 Autism spectrum disorder (6A02)

**6B0Y****Other specified anxiety or fear-related disorders****6B0Z****Anxiety or fear-related disorders, unspecified**

## Obsessive-compulsive or related disorders (6B20-6B2Z)

Obsessive-compulsive and related disorders is a group of disorders characterised by repetitive thoughts and behaviours that are believed to share similarities in aetiology and key diagnostic validators. Cognitive phenomena such as obsessions, intrusive thoughts and preoccupations are central to a subset of these conditions (i.e., obsessive-compulsive disorder, body dysmorphic disorder, hypochondriasis, and olfactory reference disorder) and are accompanied by related repetitive behaviours. Hoarding Disorder is not associated with intrusive unwanted thoughts but rather is characterised by a compulsive need to accumulate possessions and distress related to discarding them. Also included in the grouping are body-focused repetitive behaviour disorders, which are primarily characterised by recurrent and habitual actions directed at the integument (e.g., hair-pulling, skin-picking) and lack a prominent cognitive aspect. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning.

**Coded Elsewhere:** Substance-induced obsessive-compulsive or related disorders

Secondary obsessive-compulsive or related syndrome (6E64)

Tourette syndrome (8A05.00)

### 6B20

#### Obsessive-compulsive disorder

Obsessive-Compulsive Disorder is characterised by the presence of persistent obsessions or compulsions, or most commonly both. Obsessions are repetitive and persistent thoughts, images, or impulses/urges that are intrusive, unwanted, and are commonly associated with anxiety. The individual attempts to ignore or suppress obsessions or to neutralize them by performing compulsions. Compulsions are repetitive behaviours including repetitive mental acts that the individual feels driven to perform in response to an obsession, according to rigid rules, or to achieve a sense of 'completeness'. In order for obsessive-compulsive disorder to be diagnosed, obsessions and compulsions must be time consuming (e.g. taking more than an hour per day) or result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:** anankastic neurosis  
obsessive-compulsive neurosis

**Exclusions:** obsessive compulsive behaviour (MB23.4)

### 6B20.0

#### Obsessive-compulsive disorder with fair to good insight

All definitional requirements of obsessive-compulsive disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

### 6B20.1

#### Obsessive-compulsive disorder with poor to absent insight

All definitional requirements of obsessive-compulsive disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

### 6B20.Z

#### Obsessive-compulsive disorder, unspecified

**6B21****Body dysmorphic disorder**

Body Dysmorphic Disorder is characterised by persistent preoccupation with one or more perceived defects or flaws in appearance that are either unnoticeable or only slightly noticeable to others. Individuals experience excessive self-consciousness, often with ideas of reference (i.e., the conviction that people are taking notice, judging, or talking about the perceived defect or flaw). In response to their preoccupation, individuals engage in repetitive and excessive behaviours that include repeated examination of the appearance or severity of the perceived defect or flaw, excessive attempts to camouflage or alter the perceived defect, or marked avoidance of social situations or triggers that increase distress about the perceived defect or flaw. The symptoms are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:**

Anorexia Nervosa (6B80)

Bodily distress disorder (6C20)

Concern about body appearance (QD30-QD3Z)

**6B21.0****Body dysmorphic disorder with fair to good insight**

All definitional requirements of body dysmorphic disorder are met. Much of the time, the individual is able to entertain the possibility that his or her disorder-specific beliefs may not be true and is willing to accept an alternative explanation for his or her experience. At circumscribed times (e.g., when highly anxious), the individual may demonstrate no insight.

**6B21.1****Body dysmorphic disorder with poor to absent insight**

All definitional requirements of body dysmorphic disorder are met. Most or all of the time, the individual is convinced that the disorder-specific beliefs are true and cannot accept an alternative explanation for their experience. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

**6B21.Z****Body dysmorphic disorder, unspecified****6B22****Olfactory reference disorder**

Olfactory Reference Disorder is characterised by persistent preoccupation with the belief that one is emitting a perceived foul or offensive body odour or breath that is either unnoticeable or only slightly noticeable to others. Individuals experience excessive self-consciousness about the perceived odour, often with ideas of reference (i.e., the conviction that people are taking notice, judging, or talking about the odour). In response to their preoccupation, individuals engage in repetitive and excessive behaviours such as repeatedly checking for body odour or checking the perceived source of the smell, or repeatedly seeking reassurance, excessive attempts to camouflage, alter, or prevent the perceived odour, or marked avoidance of social situations or triggers that increase distress about the perceived foul or offensive odour. The symptoms are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**6B24****Hoarding disorder**

Hoarding disorder is characterised by accumulation of possessions that results in living spaces becoming cluttered to the point that their use or safety is compromised. Accumulation occurs due to both repetitive urges or behaviours related to amassing items and difficulty discarding possessions due to a perceived need to save items and distress associated with discarding them. If living areas are uncluttered this is only due to the intervention of third parties (e.g., family members, cleaners, authorities). Amassment may be passive (e.g. accumulation of incoming flyers or mail) or active (e.g. excessive acquisition of free, purchased, or stolen items). The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B24.0****Hoarding disorder with fair to good insight**

All definitional requirements of hoarding disorder are met. The individual recognizes that hoarding-related beliefs and behaviours (pertaining to excessive acquisition, difficulty discarding, or clutter) are problematic. This qualifier level may still be applied if, at circumscribed times (e.g., when being forced to discard items), the individual demonstrates no insight.

**6B24.1****Hoarding disorder with poor to absent insight**

All definitional requirements of hoarding disorder are met. Most or all of the time, the individual is convinced that that hoarding-related beliefs and behaviours (pertaining to excessive acquisition, difficulty discarding, or clutter) are not problematic, despite evidence to the contrary. The lack of insight exhibited by the individual does not vary markedly as a function of anxiety level.

**6B24.Z****Hoarding disorder, unspecified****6B25****Body-focused repetitive behaviour disorders**

Body focused repetitive behaviour disorders are characterised by recurrent and habitual actions directed at the integument (e.g. hair-pulling, skin-picking, lip-biting), typically accompanied by unsuccessful attempts to decrease or stop the behaviour involved, and which lead to dermatological sequelae (e.g., hair loss, skin lesions, lip abrasions). The behaviour may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B25.0****Trichotillomania**

Trichotillomania is characterised by recurrent pulling of one's own hair leading to significant hair loss, accompanied by unsuccessful attempts to decrease or stop the behaviour. Hair pulling may occur from any region of the body in which hair grows but the most common sites are the scalp, eyebrows, and eyelids. Hair pulling may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:** Compulsive hair plucking

**Exclusions:** stereotyped movement disorder with hair-plucking (6A06)

**6B25.1****Excoriation disorder**

Excoriation disorder is characterised by recurrent picking of one's own skin leading to skin lesions, accompanied by unsuccessful attempts to decrease or stop the behaviour. The most commonly picked sites are the face, arms and hands, but many individuals pick from multiple body sites. Skin picking may occur in brief episodes scattered throughout the day or in less frequent but more sustained periods. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:** skin picking disorder

**Exclusions:** Stereotyped movement disorder (6A06)

Acute excoriation of skin (ME62.9)

Chronic excoriation of skin (ME63.7)

## Disorders specifically associated with stress (6B40-6B4Z)

Disorders specifically associated with stress are directly related to exposure to a stressful or traumatic event, or a series of such events or adverse experiences. For each of the disorders in this grouping, an identifiable stressor is a necessary, though not sufficient, causal factor. Although not all individuals exposed to an identified stressor will develop a disorder, the disorders in this grouping would not have occurred without experiencing the stressor. Stressful events for some disorders in this grouping are within the normal range of life experiences (e.g., divorce, socio-economic problems, bereavement). Other disorders require the experience of a stressor of an extremely threatening or horrific nature (i.e., potentially traumatic events). With all disorders in this grouping, it is the nature, pattern, and duration of the symptoms that arise in response to the stressful events—together with associated functional impairment—that distinguishes the disorders.

**Exclusions:** Burnout (QD85)  
Acute stress reaction (QE84)

### 6B40

#### Post traumatic stress disorder

Post traumatic stress disorder (PTSD) may develop following exposure to an extremely threatening or horrific event or series of events. It is characterised by all of the following: 1) re-experiencing the traumatic event or events in the present in the form of vivid intrusive memories, flashbacks, or nightmares. Re-experiencing may occur via one or multiple sensory modalities and is typically accompanied by strong or overwhelming emotions, particularly fear or horror, and strong physical sensations; 2) avoidance of thoughts and memories of the event or events, or avoidance of activities, situations, or people reminiscent of the event(s); and 3) persistent perceptions of heightened current threat, for example as indicated by hypervigilance or an enhanced startle reaction to stimuli such as unexpected noises. The symptoms persist for at least several weeks and cause significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Inclusions:** Traumatic neurosis

**Exclusions:** Acute stress reaction (QE84)  
Complex post traumatic stress disorder (6B41)

### 6B41

#### Complex post traumatic stress disorder

Complex post traumatic stress disorder (Complex PTSD) is a disorder that may develop following exposure to an event or series of events of an extremely threatening or horrific nature, most commonly prolonged or repetitive events from which escape is difficult or impossible (e.g. torture, slavery, genocide campaigns, prolonged domestic violence, repeated childhood sexual or physical abuse). All diagnostic requirements for PTSD are met. In addition, Complex PTSD is characterised by severe and persistent 1) problems in affect regulation; 2) beliefs about oneself as diminished, defeated or worthless, accompanied by feelings of shame, guilt or failure related to the traumatic event; and 3) difficulties in sustaining relationships and in feeling close to others. These symptoms cause significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:** Post traumatic stress disorder (6B40)  
Personality disorder (6D10)

**6B42****Prolonged grief disorder**

Prolonged grief disorder is a disturbance in which, following the death of a partner, parent, child, or other person close to the bereaved, there is persistent and pervasive grief response characterised by longing for the deceased or persistent preoccupation with the deceased accompanied by intense emotional pain (e.g. sadness, guilt, anger, denial, blame, difficulty accepting the death, feeling one has lost a part of one's self, an inability to experience positive mood, emotional numbness, difficulty in engaging with social or other activities). The grief response has persisted for an atypically long period of time following the loss (more than 6 months at a minimum) and clearly exceeds expected social, cultural or religious norms for the individual's culture and context. Grief reactions that have persisted for longer periods that are within a normative period of grieving given the person's cultural and religious context are viewed as normal bereavement responses and are not assigned a diagnosis. The disturbance causes significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B43****Adjustment disorder**

Adjustment disorder is a maladaptive reaction to an identifiable psychosocial stressor or multiple stressors (e.g. divorce, illness or disability, socio-economic problems, conflicts at home or work) that usually emerges within a month of the stressor. The disorder is characterised by preoccupation with the stressor or its consequences, including excessive worry, recurrent and distressing thoughts about the stressor, or constant rumination about its implications, as well as by failure to adapt to the stressor that causes significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The symptoms are not better explained by another mental disorder (e.g., Mood Disorder, another Disorder Specifically Associated with Stress) and typically resolve within 6 months, unless the stressor persists for a longer duration.

**Exclusions:**

- separation anxiety disorder of childhood (6B05)
- Recurrent depressive disorder (6A71)
- Single episode depressive disorder (6A70)
- Prolonged grief disorder (6B42)
- Uncomplicated bereavement (QE62)
- Burnout (QD85)
- Acute stress reaction (QE84)

**6B44**

### **Reactive attachment disorder**

Reactive attachment disorder is characterised by grossly abnormal attachment behaviours in early childhood, occurring in the context of a history of grossly inadequate child care (e.g., severe neglect, maltreatment, institutional deprivation). Even when an adequate primary caregiver is newly available, the child does not turn to the primary caregiver for comfort, support and nurture, rarely displays security-seeking behaviours towards any adult, and does not respond when comfort is offered. Reactive attachment disorder can only be diagnosed in children, and features of the disorder develop within the first 5 years of life. However, the disorder cannot be diagnosed before the age of 1 year (or a developmental age of less than 9 months), when the capacity for selective attachments may not be fully developed, or in the context of Autism spectrum disorder.

**Exclusions:**

Asperger syndrome (6A02)

disinhibited attachment disorder of childhood (6B45)

**6B45**

### **Disinhibited social engagement disorder**

Disinhibited social engagement disorder is characterised by grossly abnormal social behaviour, occurring in the context of a history of grossly inadequate child care (e.g., severe neglect, institutional deprivation). The child approaches adults indiscriminately, lacks reticence to approach, will go away with unfamiliar adults, and exhibits overly familiar behaviour towards strangers. Disinhibited social engagement disorder can only be diagnosed in children, and features of the disorder develop within the first 5 years of life. However, the disorder cannot be diagnosed before the age of 1 year (or a developmental age of less than 9 months), when the capacity for selective attachments may not be fully developed, or in the context of Autism spectrum disorder.

**Exclusions:**

Asperger syndrome (6A02)

Adjustment disorder (6B43)

Attention deficit hyperactivity disorder (6A05)

reactive attachment disorder of childhood (6B44)

**6B4Y**

### **Other specified disorders specifically associated with stress**

**6B4Z**

### **Disorders specifically associated with stress, unspecified**

## Dissociative disorders (6B60-6B6Z)

Dissociative disorders are characterised by involuntary disruption or discontinuity in the normal integration of one or more of the following: identity, sensations, perceptions, affects, thoughts, memories, control over bodily movements, or behaviour. Disruption or discontinuity may be complete, but is more commonly partial, and can vary from day to day or even from hour to hour. The symptoms of dissociative disorders are not due to the direct effects of a medication or substance, including withdrawal effects, are not better explained by another Mental, behavioural, or neurodevelopmental disorder, a Sleep-wake disorder, a Disease of the nervous system or other health condition, and are not part of an accepted cultural, religious, or spiritual practice. Dissociative symptoms in dissociative disorders are sufficiently severe to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Coded Elsewhere:** Secondary dissociative syndrome (6E65)

### 6B60

#### **Dissociative neurological symptom disorder**

Dissociative neurological symptom disorder is characterised by the presentation of motor, sensory, or cognitive symptoms that imply an involuntary discontinuity in the normal integration of motor, sensory, or cognitive functions and are not consistent with a recognised disease of the nervous system, other mental or behavioural disorder, or other medical condition. The symptoms do not occur exclusively during another dissociative disorder and are not due to the effects of a substance or medication on the central nervous system, including withdrawal effects, or a Sleep-Wake disorder.

**Exclusions:** Factitious disorders (6D50-6D5Z)

#### **6B60.0**

##### **Dissociative neurological symptom disorder, with visual disturbance**

Dissociative neurological symptom disorder, with visual disturbance is characterised by visual symptoms such as blindness, tunnel vision, diplopia, visual distortions or hallucinations that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

#### **6B60.1**

##### **Dissociative neurological symptom disorder, with auditory disturbance**

Dissociative neurological symptom disorder, with auditory disturbance is characterised by auditory symptoms such as loss of hearing or auditory hallucinations that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

#### **6B60.2**

##### **Dissociative neurological symptom disorder, with vertigo or dizziness**

Dissociative neurological symptom disorder, with vertigo or dizziness is characterised by a sensation of spinning while stationary (vertigo) or dizziness that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.

- 6B60.3 Dissociative neurological symptom disorder, with other sensory disturbance**  
Dissociative neurological symptom disorder, with other sensory disturbance is characterised by sensory symptoms not identified in other specific categories in this grouping such as numbness, tightness, tingling, burning, pain, or other symptoms related to touch, smell, taste, balance, proprioception, kinesthesia, or thermoception. The symptoms are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.4 Dissociative neurological symptom disorder, with non-epileptic seizures**  
Dissociative neurological symptom disorder, with non-epileptic seizures is characterised by a symptomatic presentation of seizures or convulsions that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.5 Dissociative neurological symptom disorder, with speech disturbance**  
Dissociative neurological symptom disorder, with speech disturbance is characterised by symptoms such as difficulty with speaking (dysphonia), loss of the ability to speak (aphonia) or difficult or unclear articulation of speech (dysarthria) that are not consistent with a recognised disease of the nervous system, a neurodevelopmental or neurocognitive disorder, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.6 Dissociative neurological symptom disorder, with paresis or weakness**  
Dissociative neurological symptom disorder, with paresis or weakness is characterised by a difficulty or inability to intentionally move parts of the body or to coordinate movements that is not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and does not occur exclusively during another dissociative disorder.
- 6B60.7 Dissociative neurological symptom disorder, with gait disturbance**  
Dissociative neurological symptom disorder, with gait disturbance is characterised by symptoms involving the individual's ability or manner of walking, including ataxia and the inability to stand unaided, that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.
- 6B60.8 Dissociative neurological symptom disorder, with movement disturbance**  
Dissociative neurological symptom disorder, with movement disturbance is characterised by symptoms such as chorea, myoclonus, tremor, dystonia, facial spasm, parkinsonism, or dyskinesia that are not consistent with a recognised disease of the nervous system, other mental, behavioural or neurodevelopmental disorder, or other medical condition and do not occur exclusively during another dissociative disorder.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>6B61</b>    | <p><b>Dissociative amnesia</b></p> <p>Dissociative amnesia is characterised by an inability to recall important autobiographical memories, typically of recent traumatic or stressful events, that is inconsistent with ordinary forgetting. The amnesia does not occur exclusively during another dissociative disorder and is not better explained by another mental, behavioural or neurodevelopmental disorder. The amnesia is not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and is not due to a disease of the nervous system or to head trauma. The amnesia results in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.</p> <p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>amnesia NOS (MB21.1)</li> <li>Amnestic disorder due to use of alcohol (6D72.10)</li> <li>Anterograde amnesia (MB21.10)</li> <li>Retrograde amnesia (MB21.11)</li> <li>nonalcoholic organic amnesic syndrome (6D72.0)</li> <li>postictal amnesia in epilepsy (8A60-8A6Z)</li> </ul> |

**6B62****Trance disorder**

Trance disorder is characterised by trance states in which there is a marked alteration in the individual's state of consciousness or a loss of the individual's customary sense of personal identity in which the individual experiences a narrowing of awareness of immediate surroundings or unusually narrow and selective focusing on environmental stimuli and restriction of movements, postures, and speech to repetition of a small repertoire that is experienced as being outside of one's control. The trance state is not characterised by the experience of being replaced by an alternate identity. Trance episodes are recurrent or, if the diagnosis is based on a single episode, the episode has lasted for at least several days. The trance state is involuntary and unwanted and is not accepted as a part of a collective cultural or religious practice. The symptoms do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The symptoms are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, exhaustion, or to hypnagogic or hypnopompic states, and are not due to a disease of the nervous system, head trauma, or a sleep-wake disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B63****Possession trance disorder**

Possession trance disorder is characterised by trance states in which there is a marked alteration in the individual's state of consciousness and the individual's customary sense of personal identity is replaced by an external 'possessing' identity and in which the individual's behaviours or movements are experienced as being controlled by the possessing agent. Possession trance episodes are recurrent or, if the diagnosis is based on a single episode, the episode has lasted for at least several days. The possession trance state is involuntary and unwanted and is not accepted as a part of a collective cultural or religious practice. The symptoms do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The symptoms are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, exhaustion, or to hypnagogic or hypnopompic states, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:**

Schizophrenia (6A20)

Disorders due to use of other specified psychoactive substances, including medications (6C4E)

Acute and transient psychotic disorder (6A23)

Secondary personality change (6E68)

6B64

### **Dissociative identity disorder**

Dissociative identity disorder is characterised by disruption of identity in which there are two or more distinct personality states (dissociative identities) associated with marked discontinuities in the sense of self and agency. Each personality state includes its own pattern of experiencing, perceiving, conceiving, and relating to self, the body, and the environment. At least two distinct personality states recurrently take executive control of the individual's consciousness and functioning in interacting with others or with the environment, such as in the performance of specific aspects of daily life such as parenting, or work, or in response to specific situations (e.g., those that are perceived as threatening). Changes in personality state are accompanied by related alterations in sensation, perception, affect, cognition, memory, motor control, and behaviour. There are typically episodes of amnesia, which may be severe. The symptoms are not better explained by another mental, behavioural or neurodevelopmental disorder and are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

6B65

### **Partial dissociative identity disorder**

Partial dissociative identity disorder is characterised by disruption of identity in which there are two or more distinct personality states (dissociative identities) associated with marked discontinuities in the sense of self and agency. Each personality state includes its own pattern of experiencing, perceiving, conceiving, and relating to self, the body, and the environment. One personality state is dominant and normally functions in daily life, but is intruded upon by one or more non-dominant personality states (dissociative intrusions). These intrusions may be cognitive, affective, perceptual, motor, or behavioural. They are experienced as interfering with the functioning of the dominant personality state and are typically aversive. The non-dominant personality states do not recurrently take executive control of the individual's consciousness and functioning, but there may be occasional, limited and transient episodes in which a distinct personality state assumes executive control to engage in circumscribed behaviours, such as in response to extreme emotional states or during episodes of self-harm or the reenactment of traumatic memories. The symptoms are not better explained by another mental, behavioural or neurodevelopmental disorder and are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or a sleep-wake disorder. The symptoms result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B66****Depersonalization-derealization disorder**

Depersonalization-derealization disorder is characterised by persistent or recurrent experiences of depersonalization, derealization, or both. Depersonalization is characterised by experiencing the self as strange or unreal, or feeling detached from, or as though one were an outside observer of, one's thoughts, feelings, sensations, body, or actions. Derealization is characterised by experiencing other persons, objects, or the world as strange or unreal (e.g., dreamlike, distant, foggy, lifeless, colourless, or visually distorted) or feeling detached from one's surroundings. During experiences of depersonalization or derealization, reality testing remains intact. The experiences of depersonalization or derealization do not occur exclusively during another dissociative disorder and are not better explained by another mental, behavioural or neurodevelopmental disorder. The experiences of depersonalization or derealization are not due to the direct effects of a substance or medication on the central nervous system, including withdrawal effects, and are not due to a disease of the nervous system or to head trauma. The symptoms result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning.

**6B6Y****Other specified dissociative disorders****6B6Z****Dissociative disorders, unspecified****Feeding or eating disorders (6B80-6B8Z)**

Feeding and Eating Disorders involve abnormal eating or feeding behaviours that are not explained by another health condition and are not developmentally appropriate or culturally sanctioned. Feeding disorders involve behavioural disturbances that are not related to body weight and shape concerns, such as eating of non-edible substances or voluntary regurgitation of foods. Eating disorders involve abnormal eating behaviour and preoccupation with food as well as prominent body weight and shape concerns.

**6B80****Anorexia Nervosa**

Anorexia Nervosa is characterised by significantly low body weight for the individual's height, age and developmental stage that is not due to another health condition or to the unavailability of food. A commonly used threshold is body mass index (BMI) less than 18.5 kg/m<sup>2</sup> in adults and BMI-for-age under 5th percentile in children and adolescents. Rapid weight loss (e.g. more than 20% of total body weight within 6 months) may replace the low body weight guideline as long as other diagnostic requirements are met. Children and adolescents may exhibit failure to gain weight as expected based on the individual developmental trajectory rather than weight loss. Low body weight is accompanied by a persistent pattern of behaviours to prevent restoration of normal weight, which may include behaviours aimed at reducing energy intake (restricted eating), purging behaviours (e.g. self-induced vomiting, misuse of laxatives), and behaviours aimed at increasing energy expenditure (e.g. excessive exercise), typically associated with a fear of weight gain. Low body weight or shape is central to the person's self-evaluation or is inaccurately perceived to be normal or even excessive.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**6B80.1Z** Anorexia Nervosa with dangerously low body weight, unspecified

**6B80.2 Anorexia Nervosa in recovery with normal body weight**

Among individuals who are recovering from Anorexia Nervosa and whose body weight is more than 18.5 kg/m<sup>2</sup> for adults or over the fifth percentile for BMI-for-age for children and adolescents, the diagnosis should be retained until a full and lasting recovery is achieved, as indicated by the maintenance of a healthy weight and the cessation of behaviours aimed at reducing body weight independent of the provision of treatment (e.g., for at least 1 year after intensive treatment is withdrawn).

**6B80.Y Other specified anorexia Nervosa**

**6B80.Z Anorexia Nervosa, unspecified**

**6B81 Bulimia Nervosa**

Bulimia Nervosa is characterised by frequent, recurrent episodes of binge eating (e.g. once a week or more over a period of at least one month). A binge eating episode is a distinct period of time during which the individual experiences a subjective loss of control over eating, eating notably more or differently than usual, and feels unable to stop eating or limit the type or amount of food eaten. Binge eating is accompanied by repeated inappropriate compensatory behaviours aimed at preventing weight gain (e.g. self-induced vomiting, misuse of laxatives or enemas, strenuous exercise). The individual is preoccupied with body shape or weight, which strongly influences self-evaluation. There is marked distress about the pattern of binge eating and inappropriate compensatory behaviour or significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The individual does not meet the diagnostic requirements of Anorexia Nervosa.

**Exclusions:** Binge eating disorder (6B82)

**6B82 Binge eating disorder**

Binge eating disorder is characterised by frequent, recurrent episodes of binge eating (e.g. once a week or more over a period of several months). A binge eating episode is a distinct period of time during which the individual experiences a subjective loss of control over eating, eating notably more or differently than usual, and feels unable to stop eating or limit the type or amount of food eaten. Binge eating is experienced as very distressing, and is often accompanied by negative emotions such as guilt or disgust. However, unlike in Bulimia Nervosa, binge eating episodes are not regularly followed by inappropriate compensatory behaviours aimed at preventing weight gain (e.g. self-induced vomiting, misuse of laxatives or enemas, strenuous exercise). There is marked distress about the pattern of binge eating or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:** Bulimia Nervosa (6B81)

**6B83****Avoidant-restrictive food intake disorder**

Avoidant-restrictive food intake disorder (ARFID) is characterised by avoidance or restriction of food intake that results in: 1) the intake of an insufficient quantity or variety of food to meet adequate energy or nutritional requirements that has resulted in significant weight loss, clinically significant nutritional deficiencies, dependence on oral nutritional supplements or tube feeding, or has otherwise negatively affected the physical health of the individual; or 2) significant impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to avoidance or distress related to participating in social experiences involving eating). The pattern of eating behaviour is not motivated by preoccupation with body weight or shape. Restricted food intake and its effects on weight, other aspects of health, or functioning are not due to unavailability of food, not a manifestation of another medical condition (e.g. food allergies, hyperthyroidism) or mental disorder, and are not due to the effect of a substance or medication on the central nervous system including withdrawal effects.

**Exclusions:**

Anorexia Nervosa (6B80)

Feeding problem of infant (MG43.30)

Feeding problems of newborn (KD32)

**6B84****Pica**

Pica is characterised by the regular consumption of non-nutritive substances, such as non-food objects and materials (e.g., clay, soil, chalk, plaster, plastic, metal and paper) or raw food ingredients (e.g., large quantities of salt or corn flour) that is persistent or severe enough to require clinical attention in an individual who has reached a developmental age at which they would be expected to distinguish between edible and non-edible substances (approximately 2 years). That is, the behaviour causes damage to health, impairment in functioning, or significant risk due to the frequency, amount or nature of the substances or objects ingested.

**6B85****Rumination-regurgitation disorder**

Rumination-regurgitation disorder is characterised by the intentional and repeated bringing up of previously swallowed food back to the mouth (i.e., regurgitation), which may be re-chewed and re-swallowed (i.e. rumination), or may be deliberately spat out (but not as in vomiting). The regurgitation behaviour is frequent (at least several times per week) and sustained over a period of at least several weeks. The regurgitation behaviour is not fully accounted for by another medical condition that directly causes regurgitation (e.g., oesophageal strictures or neuromuscular disorders affecting oesophageal functioning) or causes nausea or vomiting (e.g. pyloric stenosis). Rumination-regurgitation disorder should only be diagnosed in individuals who have reached a developmental age of at least 2 years.

**Exclusions:**

Adult rumination syndrome (DD90.6)

Nausea or vomiting (MD90)

**6B8Y****Other specified feeding or eating disorders****6B8Z****Feeding or eating disorders, unspecified**

## Elimination disorders (6C00-6C0Z)

Elimination disorders include the repeated voiding of urine into clothes or bed (enuresis) and the repeated passage of faeces in inappropriate places (encopresis). Elimination disorders should only be diagnosed after the individual has reached a developmental age when continence is ordinarily expected (5 years for enuresis and 4 years for encopresis). The urinary or faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder or bowel control. An Elimination disorder should not be diagnosed if the behaviour is fully attributable to another health condition that causes incontinence, congenital or acquired abnormalities of the urinary tract or bowel, or excessive use of laxatives or diuretics.

### 6C00

#### Enuresis

Enuresis is the repeated voiding of urine into clothes or bed, which may occur during the day or at night, in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional. Enuresis should not be diagnosed if unintentional voiding of urine is due to a health condition that interferes with continence (e.g., diseases of the nervous system or musculoskeletal disorders) or by congenital or acquired abnormalities of the urinary tract.

- Inclusions:**
- Functional enuresis
  - Psychogenic enuresis
  - Urinary incontinence of nonorganic origin
- Exclusions:**
- Stress incontinence (MF50.20)
  - Urge Incontinence (MF50.21)
  - Functional urinary incontinence (MF50.23)
  - Overflow Incontinence (MF50.2)
  - Reflex incontinence (MF50.24)
  - Extraurethral urinary incontinence (MF50.2)

### 6C00.0

#### Nocturnal enuresis

Nocturnal enuresis refers to repeated voiding of urine into clothes or bed that occurs only during sleep (i.e., during the night) in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.

### 6C00.1

#### Diurnal enuresis

Diurnal enuresis refers to repeated voiding of urine into clothes that occurs only during waking hours in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|               | Nocturnal and diurnal enuresis refers to repeated voiding of urine into clothes or bed that occurs both during sleep (i.e., during the night) and during waking hours in an individual who has reached a developmental age when urinary continence is ordinarily expected (5 years). The urinary incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bladder control. In most cases, the behaviour is involuntary but in some cases it appears intentional.                                                                                                                                                                                                                                                                                              |
| <b>6C00.Z</b> | <b>Enuresis, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>6C01</b>   | <b>Encopresis</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|               | Encopresis is the repeated passage of faeces in inappropriate places. Encopresis should be diagnosed if inappropriate passage of faeces occurs repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis should not be diagnosed if faecal soiling is fully attributable to another health condition (e.g., aganglionic megacolon, spina bifida, dementia), congenital or acquired abnormalities of the bowel, gastrointestinal infection, or excessive use of laxatives.                                                      |
| <b>6C01.0</b> | <b>Encopresis with constipation or overflow incontinence</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|               | Encopresis is the repeated passage of faeces in inappropriate places occurring repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis with constipation and overflow incontinence is the most common form of faecal soiling, and involves retention and impaction of faeces. Stools are typically — but not always — poorly formed (loose or liquid) and leakage may range from occasional to continuous. There is often a history of toilet avoidance leading to constipation.                                             |

|               | Encopresis is the repeated passage of faeces in inappropriate places occurring repeatedly (e.g., at least once per month over a period of several months) in an individual who has reached the developmental age when faecal continence is ordinarily expected (4 years). The faecal incontinence may have been present from birth (i.e., an atypical extension of normal infantile incontinence), or may have arisen following a period of acquired bowel control. Encopresis without constipation and overflow is not associated with retention and impaction of faeces, but rather reflects reluctance, resistance or failure to conform to social norms in defecating in acceptable places in the context of normal physiological control over defecation. Stools are typically of normal consistency and inappropriate defecation is likely to be intermittent. |

## Disorders of bodily distress or bodily experience (6C20-6C2Z)

Disorders of bodily distress and bodily experience are characterised by disturbances in the person's experience of his or her body. Bodily distress disorder involves bodily symptoms that the individual finds distressing and to which excessive attention is directed. Body integrity dysphoria involves a disturbance in the person's experience of the body manifested by the persistent desire to have a specific physical disability accompanied by persistent discomfort, or intense feelings of inappropriateness concerning current non-disabled body configuration.

**Exclusions:** Dissociative neurological symptom disorder (6B60)  
Concern about body appearance (QD30-QD3Z)

### 6C20

#### **Bodily distress disorder**

Bodily distress disorder is characterised by the presence of bodily symptoms that are distressing to the individual and excessive attention directed toward the symptoms, which may be manifest by repeated contact with health care providers. If another health condition is causing or contributing to the symptoms, the degree of attention is clearly excessive in relation to its nature and progression. Excessive attention is not alleviated by appropriate clinical examination and investigations and appropriate reassurance. Bodily symptoms are persistent, being present on most days for at least several months. Typically, bodily distress disorder involves multiple bodily symptoms that may vary over time. Occasionally there is a single symptom—usually pain or fatigue—that is associated with the other features of the disorder. The symptoms and associated distress and preoccupation have at least some impact on the individual's functioning (e.g. strain in relationships, less effective academic or occupational functioning, abandonment of specific leisure activities).

**6C20.0****Mild bodily distress disorder**

All definitional requirements of bodily distress disorder are present. There is excessive attention to distressing symptoms and their consequences, which may result in frequent medical visits, but the person is not preoccupied with the symptoms (e.g., the individual spends less than an hour per day focusing on them). Although the individual expresses distress about the symptoms and they may have some impact on his or her life (e.g., strain in relationships, less effective academic or occupational functioning, abandonment of specific leisure activities), there is no substantial impairment in the person's personal, family, social, educational, occupational, or other important areas of functioning.

**6C20.1****Moderate bodily distress disorder**

All definitional requirements of bodily distress disorder are present. There is persistent preoccupation with the distressing symptoms and their consequences (e.g., the individual spends more than an hour a day thinking about them), typically associated with frequent medical visits. The person devotes much of his or her energy to focusing on the symptoms and their consequences. The symptoms and associated distress and preoccupation cause moderate impairment in personal, family, social, educational, occupational, or other important areas of functioning (e.g., relationship conflict, performance problems at work, abandonment of a range of social and leisure activities).

**6C20.2****Severe bodily distress disorder**

All definitional requirements of Bodily distress disorder are present. There is pervasive and persistent preoccupation with the symptoms and their consequences to the extent that these may become the focal point of the person's life, typically resulting in extensive interactions with the health care system. The symptoms and associated distress and preoccupation cause serious impairment in personal, family, social, educational, occupational, or other important areas of functioning (e.g., unable to work, alienation of friends and family, abandonment of nearly all social and leisure activities). The person's interests may become so narrow as to focus almost exclusively on his or her bodily symptoms and their negative consequences.

**6C20.Z****Bodily distress disorder, unspecified****6C21****Body integrity dysphoria**

Body integrity dysphoria is characterised by an intense and persistent desire to become physically disabled in a significant way (e.g. major limb amputee, paraplegic, blind), with onset by early adolescence accompanied by persistent discomfort, or intense feelings of inappropriateness concerning current non-disabled body configuration. The desire to become physically disabled results in harmful consequences, as manifested by either the preoccupation with the desire (including time spent pretending to be disabled) significantly interfering with productivity, with leisure activities, or with social functioning (e.g. person is unwilling to have a close relationship because it would make it difficult to pretend) or by attempts to actually become disabled having resulted in the person putting his or her health or life in significant jeopardy. The disturbance is not better accounted for by another mental, behavioural or neurodevelopmental disorder, by a Disease of the Nervous System or by another medical condition, or by Malingering.

**Exclusions:**

Gender incongruence of adolescence or adulthood (HA60)

**6C2Y****Other specified disorders of bodily distress or bodily experience****6C2Z****Disorders of bodily distress or bodily experience, unspecified****Disorders due to substance use or addictive behaviours (6C40-6C5Z)**

Disorders due to substance use and addictive behaviours are mental and behavioural disorders that develop as a result of the use of predominantly psychoactive substances, including medications, or specific repetitive rewarding and reinforcing behaviours.

**Disorders due to substance use (6C40-6C4Z)**

Disorders due to substance use include disorders that result from a single occasion or repeated use of substances that have psychoactive properties, including certain medications. Disorders related to fourteen classes or groups of psychoactive substances are included. Typically, initial use of these substances produces pleasant or appealing psychoactive effects that are rewarding and reinforcing with repeated use. With continued use, many of the included substances have the capacity to produce dependence. They also have the potential to cause numerous forms of harm, both to mental and physical health. Disorders due to harmful non-medical use of non-psychoactive substances are also included in this grouping.

**Coded Elsewhere:** Catatonia induced by substances or medications (6A41)

**6C40****Disorders due to use of alcohol**

Disorders due to use of alcohol are characterised by the pattern and consequences of alcohol use. Alcohol—more specifically termed ethyl alcohol or ethanol—is an intoxicating compound produced by fermentation of sugars usually in agricultural products such as fruits, cereals, and vegetables with or without subsequent distillation. There are a wide variety of alcoholic drinks, with alcohol concentrations typically ranging from 1.5% to 60%. Alcohol is predominantly a central nervous system depressant. In addition to ability to produce Alcohol Intoxication, alcohol has dependence-producing properties, resulting in Alcohol Dependence in some people and Alcohol Withdrawal when alcohol use is reduced or discontinued. Unlike most other substances, elimination of alcohol from the body occurs at a constant rate, such that its clearance follows a linear rather than a logarithmic course. Alcohol is implicated in a wide range of harms affecting most organs and systems of the body (e.g., cirrhosis of the liver, gastrointestinal cancers, pancreatitis). Harm to others resulting from behaviour during Alcohol Intoxication is well recognized and is included in the definitions of harmful use of alcohol (i.e., Episode of Harmful Use of Alcohol and Harmful Pattern of Use of Alcohol). Several alcohol-induced mental disorders (e.g., Alcohol-Induced Psychotic Disorder) and alcohol-related forms of neurocognitive impairment (e.g., Dementia Due to Use of Alcohol) are recognized.

**Exclusions:** Hazardous alcohol use (QE10)

**6C40.0 Episode of harmful use of alcohol**

An episode of use of alcohol that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to alcohol intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of alcohol use.

**Exclusions:** Harmful pattern of use of alcohol (6C40.1)  
Alcohol dependence (6C40.2)

**6C40.1 Harmful pattern of use of alcohol**

A pattern of alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of alcohol use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.

**Exclusions:** Alcohol dependence (6C40.2)  
Episode of harmful use of alcohol (6C40.0)

**6C40.10 Harmful pattern of use of alcohol, episodic**

A pattern of episodic or intermittent alcohol use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic alcohol use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to alcohol intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of alcohol applies.

**Exclusions:** Episode of harmful use of alcohol (6C40.0)  
Alcohol dependence (6C40.2)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                | <p>Alcohol dependence is a disorder of regulation of alcohol use arising from repeated or continuous use of alcohol. The characteristic feature is a strong internal drive to use alcohol, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use alcohol. Physiological features of dependence may also be present, including tolerance to the effects of alcohol, withdrawal symptoms following cessation or reduction in use of alcohol, or repeated use of alcohol or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if alcohol use is continuous (daily or almost daily) for at least 3 months.</p> |

| <b>6C40.3</b>       | <p><b>Alcohol intoxication</b></p> <p>Alcohol intoxication is a clinically significant transient condition that develops during or shortly after the consumption of alcohol that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of alcohol and their intensity is closely related to the amount of alcohol consumed. They are time-limited and abate as alcohol is cleared from the body. Presenting features may include impaired attention, inappropriate or aggressive behaviour, lability of mood and emotions, impaired judgment, poor coordination, unsteady gait, fine nystagmus and slurred speech. At more severe levels of intoxication, stupor or coma may occur. Alcohol intoxication may facilitate suicidal ideation or behaviour.</p> |

**6C40.4 Alcohol withdrawal**

Alcohol withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of alcohol in individuals who have developed Alcohol dependence or have used alcohol for a prolonged period or in large amounts. Presenting features of Alcohol withdrawal may include autonomic hyperactivity (e.g. tachycardia, hypertension, perspiration), increased hand tremor, nausea, retching or vomiting, insomnia, anxiety, psychomotor agitation, depressed or dysphoric mood, transient visual, tactile or auditory illusions or hallucinations, and distractability. Less commonly, the withdrawal state is complicated by generalised tonic-clonic seizures. The withdrawal state may progress to a very severe form of delirium characterised by confusion and disorientation, delusions, and prolonged visual, tactile or auditory hallucinations. In such cases, a separate diagnosis of Alcohol-induced delirium should also be assigned.

**Coding Note:** Code also the causing condition

**6C40.40 Alcohol withdrawal, uncomplicated**

All diagnostic requirements for Alcohol Withdrawal are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.

**Coding Note:** Code also the causing condition

**6C40.41 Alcohol withdrawal with perceptual disturbances**

All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.

**Coding Note:** Code also the causing condition

**6C40.42 Alcohol withdrawal with seizures**

All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.

**Coding Note:** Code also the causing condition

**6C40.43 Alcohol withdrawal with perceptual disturbances and seizures**

All diagnostic requirements for Alcohol withdrawal are met and the withdrawal state is accompanied by both seizures (i.e., generalised tonic-clonic seizures) and perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. Diagnostic requirements for Delirium are not met.

**Coding Note:** Code also the causing condition

**6C40.4Z Alcohol withdrawal, unspecified**

**Coding Note:** Code also the causing condition

**6C40.5 Alcohol-induced delirium**

Alcohol-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of alcohol. The amount and duration of alcohol use must be capable of producing delirium. Specific features of alcohol-induced delirium may include impaired consciousness with disorientation, vivid hallucinations and illusions, insomnia, delusions, agitation, disturbances of attention, and accompanying tremor and physiological symptoms of alcohol withdrawal. In some cases of alcohol withdrawal, the withdrawal state may progress to a very severe form of Alcohol-induced delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**Inclusions:** Delirium tremens (alcohol-induced)  
Delirium induced by alcohol withdrawal

**6C40.6 Alcohol-induced psychotic disorder**

Alcohol-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from alcohol. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Alcohol intoxication or Alcohol withdrawal. The amount and duration of alcohol use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the alcohol use, if the symptoms persist for a substantial period of time after cessation of the alcohol use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with alcohol use).

**Coding Note:** Code also the causing condition

**6C40.60 Alcohol-induced psychotic disorder with hallucinations**

Alcohol-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of alcohol use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

**Coding Note:** Code also the causing condition

- 6C40.61** Alcohol-induced psychotic disorder with delusions  
Alcohol-induced psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of alcohol use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
- Coding Note:** Code also the causing condition
- 6C40.62** Alcohol-induced psychotic disorder with mixed psychotic symptoms  
Alcohol-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of alcohol use. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
- Coding Note:** Code also the causing condition
- 6C40.6Z** Alcohol-induced psychotic disorder, unspecified  
**Coding Note:** Code also the causing condition
- 6C40.7** **Certain specified alcohol-induced mental or behavioural disorders**  
**Coding Note:** Code also the causing condition  
**Coded Elsewhere:** Amnestic disorder due to use of alcohol (6D72.10)  
Dementia due to use of alcohol (6D84.0)
- 6C40.70** Alcohol-induced mood disorder  
Alcohol-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from alcohol. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Alcohol intoxication or Alcohol withdrawal. The amount and duration of alcohol use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the alcohol use, if the symptoms persist for a substantial period of time after cessation of the alcohol use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with alcohol use).
- Coding Note:** Code also the causing condition

**6C40.71****Alcohol-induced anxiety disorder**

Alcohol-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from alcohol. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Alcohol intoxication or Alcohol withdrawal. The amount and duration of alcohol use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the alcohol use, if the symptoms persist for a substantial period of time after cessation of the alcohol use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with alcohol use).

**Coding Note:** Code also the causing condition

**6C40.Y****Other specified disorders due to use of alcohol****6C40.Z****Disorders due to use of alcohol, unspecified****6C41****Disorders due to use of cannabis**

Disorders due to use of cannabis are characterised by the pattern and consequences of cannabis use. Cannabis is the collective term for a range of psychoactive preparations of the cannabis plant, *Cannabis sativa*, and related species and hybrids. Cannabis contains cannabinoids, a class of diverse chemical compounds that act on endogenous cannabinoid receptors that modulate neurotransmitter release in the brain. The principal psychoactive cannabinoid is  $\delta$ -9-tetrahydrocannabinol (THC). Cannabis is typically smoked in the form of the flowering heads or leaves of the marijuana plant; tobacco is often mixed with cannabis when smoked. There are also cannabis oils that are prepared from these same sources. These preparations vary considerably in their THC potency. Cannabis has predominantly central nervous system depressant effects and produces a characteristic euphoria that may be part of the presenting features of Cannabis Intoxication, which may also include impairment in cognitive and psychomotor functioning. Cannabis has dependence-producing properties resulting in Cannabis Dependence in some people and Cannabis Withdrawal when use is reduced or discontinued. Cannabis is associated with a range of Cannabis-Induced Mental Disorders.

**Exclusions:** Disorders due to use of synthetic cannabinoids (6C42)  
Hazardous use of cannabis (QE11.1)

**6C41.0 Episode of harmful use of cannabis**

An episode of use of cannabis that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to cannabis intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of cannabis use.

**Exclusions:** Cannabis dependence (6C41.2)  
Harmful pattern of use of cannabis (6C41.1)

**6C41.1 Harmful pattern of use of cannabis**

A pattern of cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of cannabis use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.

**Exclusions:** Cannabis dependence (6C41.2)  
Episode of harmful use of cannabis (6C41.0)

**6C41.10 Harmful pattern of use of cannabis, episodic**

A pattern of episodic or intermittent cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic cannabis use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.

**Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Cannabis dependence (6C41.2)

- 6C41.11** Harmful pattern of use of cannabis, continuous
- A pattern of continuous (daily or almost daily) cannabis use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous cannabis use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cannabis intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cannabis applies.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Cannabis dependence (6C41.2)
- 6C41.1Z** Harmful pattern of use of cannabis, unspecified
- 6C41.2 Cannabis dependence**
- Cannabis dependence is a disorder of regulation of cannabis use arising from repeated or continuous use of cannabis. The characteristic feature is a strong internal drive to use cannabis, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use cannabis. Physiological features of dependence may also be present, including tolerance to the effects of cannabis, withdrawal symptoms following cessation or reduction in use of cannabis, or repeated use of cannabis or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if cannabis use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)
- 6C41.20** Cannabis dependence, current use
- Current cannabis dependence with use of cannabis within the past month.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)
- 6C41.21** Cannabis dependence, early full remission
- After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from cannabis during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)

- 6C41.22** Cannabis dependence, sustained partial remission  
After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in cannabis consumption for more than 12 months, such that even though cannabis use has occurred during this period, the definitional requirements for dependence have not been met.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)
- 6C41.23** Cannabis dependence, sustained full remission  
After a diagnosis of cannabis dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from cannabis for 12 months or longer.
- Exclusions:** Episode of harmful use of cannabis (6C41.0)  
Harmful pattern of use of cannabis (6C41.1)
- 6C41.2Z** Cannabis dependence, unspecified
- 6C41.3 Cannabis intoxication**  
Cannabis intoxication is a clinically significant transient condition that develops during or shortly after the consumption of cannabis that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of cannabis and their intensity is closely related to the amount of cannabis consumed. They are time-limited and abate as cannabis is cleared from the body. Presenting features may include inappropriate euphoria, impaired attention, impaired judgment, perceptual alterations (such as the sensation of floating, altered perception of time), changes in sociability, increased appetite, anxiety, intensification of ordinary experiences, impaired short-term memory, and sluggishness. Physical signs include conjunctival injection (red or bloodshot eyes) and tachycardia.
- Coding Note:** Code also the causing condition
- Inclusions:** "Bad trips" due to cannabinoids
- Exclusions:** cannabinoid poisoning (NE60)  
Possession trance disorder (6B63)
- 6C41.4 Cannabis withdrawal**  
Cannabis withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of cannabis in individuals who have developed Cannabis dependence or have used cannabis for a prolonged period or in large amounts. Presenting features of Cannabis withdrawal may include irritability, anger or aggressive behaviour, shakiness, insomnia, restlessness, anxiety, depressed or dysphoric mood, decreased appetite and weight loss, headache, sweating or chills, abdominal cramps and muscle aches.
- Coding Note:** Code also the causing condition

**6C41.5 Cannabis-induced delirium**

Cannabis-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of cannabis. The amount and duration of cannabis use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**6C41.6 Cannabis-induced psychotic disorder**

Cannabis-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from cannabis. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Cannabis intoxication or Cannabis withdrawal. The amount and duration of cannabis use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the cannabis use, if the symptoms persist for a substantial period of time after cessation of the cannabis use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with cannabis use).

**Coding Note:** Code also the causing condition

**6C41.7 Certain specified cannabis-induced mental or behavioural disorders**

**Coding Note:** Code also the causing condition

**6C41.70 Cannabis-induced mood disorder**

Cannabis-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from cannabis. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Cannabis intoxication or Cannabis withdrawal. The amount and duration of cannabis use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the cannabis use, if the symptoms persist for a substantial period of time after cessation of the cannabis use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with cannabis use).

**Coding Note:** Code also the causing condition

**6C41.71****Cannabis-induced anxiety disorder**

Cannabis-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from cannabis. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Cannabis intoxication or Cannabis withdrawal. The amount and duration of cannabis use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the cannabis use, if the symptoms persist for a substantial period of time after cessation of the cannabis use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with cannabis use).

**Coding Note:** Code also the causing condition

**6C41.Y****Other specified disorders due to use of cannabis****6C41.Z****Disorders due to use of cannabis, unspecified****6C42****Disorders due to use of synthetic cannabinoids**

Disorders due to use of synthetic cannabinoids are characterised by the pattern and consequences of synthetic cannabinoid use. Synthetic cannabinoids are synthesized diverse chemical compounds that are potent agonists for endogenous cannabinoid receptors. There are several hundred such compounds. The synthetic compound is typically sprayed onto a vehicle such as cannabis or tea leaves and then smoked. The effect of these compounds is distinctly different from smoking naturally cultivated cannabis in that the euphoric effects are typically accompanied or dominated by psychotic-like symptoms (e.g., paranoia, hallucinations, and disorganized behavior). Synthetic Cannabinoid Intoxication may therefore present more frequently with psychotic symptoms in addition to the more typical effects of cannabis. Synthetic cannabinoids are also dependence-producing and Synthetic Cannabinoid Dependence and Synthetic Cannabinoid Withdrawal are recognized. Synthetic Cannabinoid-Induced Mental Disorders also occur; in particular Synthetic Cannabinoid-Induced Psychotic Disorder is recognized.

**Exclusions:** Disorders due to use of cannabis (6C41)

**6C42.0****Episode of harmful use of synthetic cannabinoids**

An episode of use of a synthetic cannabinoid that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to synthetic cannabinoid intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of synthetic cannabinoid use.

**Exclusions:** Harmful pattern of use of synthetic cannabinoids (6C42.1)  
Synthetic cannabinoid dependence (6C42.2)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**6C42.2 Synthetic cannabinoid dependence**

Synthetic cannabinoid dependence is a disorder of regulation of synthetic cannabinoid use arising from repeated or continuous use of synthetic cannabinoids. The characteristic feature is a strong internal drive to use synthetic cannabinoids, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use synthetic cannabinoids. Physiological features of dependence may also be present, including tolerance to the effects of synthetic cannabinoids, withdrawal symptoms following cessation or reduction in use of synthetic cannabinoids, or repeated use of synthetic cannabinoids or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if synthetic cannabinoid use is continuous (daily or almost daily) for at least 3 months.

**Exclusions:** Episode of harmful use of synthetic cannabinoids (6C42.0)  
Harmful pattern of use of synthetic cannabinoids (6C42.1)

**6C42.20 Synthetic cannabinoid dependence, current use**

Current synthetic cannabinoid dependence with use of synthetic cannabinoids within the past month.

**Exclusions:** Episode of harmful use of synthetic cannabinoids (6C42.0)  
Harmful pattern of use of synthetic cannabinoids (6C42.1)

**6C42.21 Synthetic cannabinoid dependence, early full remission**

After a diagnosis of synthetic cannabinoid dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from synthetic cannabinoid use during a period lasting between 1 and 12 months.

**Exclusions:** Episode of harmful use of synthetic cannabinoids (6C42.0)  
Harmful pattern of use of synthetic cannabinoids (6C42.1)

**6C42.22 Synthetic cannabinoid dependence, sustained partial remission**

After a diagnosis of synthetic cannabinoid dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in synthetic cannabinoid consumption for more than 12 months, such that even though synthetic cannabinoid use has occurred during this period, the definitional requirements for dependence have not been met.

**Exclusions:** Episode of harmful use of synthetic cannabinoids (6C42.0)  
Harmful pattern of use of synthetic cannabinoids (6C42.1)

**6C42.23 Synthetic cannabinoid dependence, sustained full remission**

After a diagnosis of synthetic cannabinoid dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from synthetic cannabinoid use for 12 months or longer.

**Exclusions:** Episode of harmful use of synthetic cannabinoids (6C42.0)  
Harmful pattern of use of synthetic cannabinoids (6C42.1)

**6C42.2Y** Other specified synthetic cannabinoid dependence

**6C42.2Z** Synthetic cannabinoid dependence, unspecified

**6C42.3 Synthetic cannabinoid intoxication**

Synthetic cannabinoid intoxication is a clinically significant transient condition that develops during or shortly after the consumption of synthetic cannabinoids that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of synthetic cannabinoids and their intensity is closely related to the amount of synthetic cannabinoid consumed. They are time-limited and abate as synthetic cannabinoid is cleared from the body. Presenting features may include inappropriate euphoria, impaired attention, impaired judgment, perceptual alterations (such as the sensation of floating, altered perception of time), changes in sociability, increased appetite, anxiety, intensification of ordinary experiences, impaired short-term memory, and sluggishness. Physical signs include conjunctival injection (red or bloodshot eyes) and tachycardia. Intoxication with synthetic cannabinoids may also cause delirium or acute psychosis.

**Coding Note:** Code also the causing condition

**6C42.4 Synthetic cannabinoid withdrawal**

Synthetic cannabinoid withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of synthetic cannabinoids in individuals who have developed Synthetic cannabinoid dependence or have used synthetic cannabinoids for a prolonged period or in large amounts. Presenting features of Synthetic cannabinoid withdrawal may include irritability, anger, aggression, shakiness, insomnia and disturbing dreams, restlessness, anxiety, depressed mood and appetite disturbance. In the early phase, Synthetic cannabinoid withdrawal may be accompanied by residual features of intoxication from the drug, such as paranoid ideation and auditory and visual hallucinations.

**Coding Note:** Code also the causing condition

**6C42.5 Synthetic cannabinoid-induced delirium**

Synthetic cannabinoid-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of synthetic cannabinoids. The amount and duration of synthetic cannabinoid use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**6C42.6 Synthetic cannabinoid-induced psychotic disorder**

Synthetic cannabinoid-induced psychotic disorder is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cannabinoids. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Synthetic cannabinoid intoxication or Synthetic cannabinoid withdrawal. The amount and duration of synthetic cannabinoid use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the synthetic cannabinoid use, if the symptoms persist for a substantial period of time after cessation of the synthetic cannabinoid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with synthetic cannabinoid use).

**Coding Note:** Code also the causing condition

**6C42.7 Certain specified synthetic cannabinoids-induced mental or behavioural disorders**

**Coding Note:** Code also the causing condition

**6C42.70 Synthetic cannabinoid-induced mood disorder**

Synthetic cannabinoid-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from synthetic cannabinoids. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Synthetic cannabinoid intoxication or Synthetic cannabinoid withdrawal. The amount and duration of synthetic cannabinoid use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the synthetic cannabinoid use, if the symptoms persist for a substantial period of time after cessation of the synthetic cannabinoid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with synthetic cannabinoid use).

**Coding Note:** Code also the causing condition

**6C42.71****Synthetic cannabinoid-induced anxiety disorder**

Synthetic cannabinoid-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cannabinoids. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Synthetic cannabinoid intoxication or Synthetic cannabinoid withdrawal. The amount and duration of synthetic cannabinoid use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the synthetic cannabinoid use, if the symptoms persist for a substantial period of time after cessation of the synthetic cannabinoid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with synthetic cannabinoid use).

**Coding Note:** Code also the causing condition

**6C42.Y****Other specified disorders due to use of synthetic cannabinoids****6C42.Z****Disorders due to use of synthetic cannabinoids, unspecified****6C43****Disorders due to use of opioids**

Disorders due to use of opioids are characterised by the pattern and consequences of opioid use. Opioids is a generic term that encompasses the constituents or derivatives of the opium poppy *Papaver somniferum* as well as a range of synthetic and semisynthetic compounds, some related to morphine and others chemically distinct but all having their primary actions on the  $\mu$  opioid receptor. Examples of opioids include morphine, diacetylmorphine (heroin), fentanyl, pethidine, oxycodone, hydromorphone, methadone, buprenorphine, codeine and d-propoxyphene. The opioids all have analgesic properties of different potencies and are primarily central nervous system depressants. They suppress respiration as well as other vital functions and are a common cause of overdose and related deaths. Certain opioids are used or administered parenterally, including heroin, a common and potent opioid that is primarily used non-medically. Therapeutic opioids are prescribed for a range of indications worldwide, and are essential for pain management in cancer pain and palliative care, although they are also used for non-therapeutic reasons. In some countries morbidity and mortality related to therapeutic opioids is greater than that related to heroin. All opioids may result in Opioid Intoxication, Opioid Dependence and Opioid Withdrawal. A range of Opioid-Induced Disorders occur, some of which occur following Opioid Withdrawal.

**Exclusions:** Hazardous use of opioids (QE11.0)

**6C43.0****Episode of harmful use of opioids**

An episode of opioid use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to opioid intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of opioid use.

**Exclusions:** Harmful pattern of use of opioids (6C43.1)  
Opioid dependence (6C43.2)

**6C43.1****Harmful pattern of use of opioids**

A pattern of use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of opioid use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.

**Exclusions:** Episode of harmful use of opioids (6C43.0)  
Opioid dependence (6C43.2)

**6C43.10****Harmful pattern of use of opioids, episodic**

A pattern of episodic or intermittent use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic opioid use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.

**Exclusions:** Episode of harmful use of opioids (6C43.0)  
Opioid dependence (6C43.2)

- 6C43.11** Harmful pattern of use of opioids, continuous
- A pattern of continuous (daily or almost daily) use of opioids that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous opioid use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to opioid intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of opioids applies.
- Exclusions:** Episode of harmful use of opioids (6C43.0)  
Opioid dependence (6C43.2)
- 6C43.1Z** Harmful pattern of use of opioids, unspecified
- 6C43.2** **Opioid dependence**
- Opioid dependence is a disorder of regulation of opioid use arising from repeated or continuous use of opioids. The characteristic feature is a strong internal drive to use opioids, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use opioids. Physiological features of dependence may also be present, including tolerance to the effects of opioids, withdrawal symptoms following cessation or reduction in use of opioids, or repeated use of opioids or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if opioid use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of opioids (6C43.0)  
Harmful pattern of use of opioids (6C43.1)
- 6C43.20** Opioid dependence, current use
- Opioid dependence, with use of an opioid within the past month.
- Exclusions:** Episode of harmful use of opioids (6C43.0)  
Harmful pattern of use of opioids (6C43.1)
- 6C43.21** Opioid dependence, early full remission
- After a diagnosis of opioid dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from opioid use during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of opioids (6C43.0)  
Harmful pattern of use of opioids (6C43.1)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>6C43.3</b>  | <p><b>Opioid intoxication</b></p> <p>Opioid intoxication is a clinically significant transient condition that develops during or shortly after the consumption of opioids that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of opioids and their intensity is closely related to the amount of opioids consumed. They are time-limited and abate as opioids are cleared from the body. Presenting features may include somnolence, stupor, mood changes (e.g. euphoria followed by apathy and dysphoria), psychomotor retardation, impaired judgment, respiratory depression, slurred speech, and impairment of memory and attention. In severe intoxication coma may ensue. A characteristic physical sign is pupillary constriction but this sign may be absent when intoxication is due to synthetic opioids. Severe opioid intoxication can lead to death due to respiratory depression.</p> <p><b>Coding Note:</b>       Code also the causing condition</p> <p><b>Exclusions:</b>           opioid poisoning (NE60)<br/>                                  Possession trance disorder (6B63)<br/>                                  fentanyl poisoning (NE60)<br/>                                  oxycodone poisoning (NE60)</p> |

**6C43.4 Opioid withdrawal**

Opioid withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of opioids in individuals who have developed Opioid dependence or have used opioids for a prolonged period or in large amounts. Opioid withdrawal can also occur when prescribed opioids have been used in standard therapeutic doses. Presenting features of Opioid withdrawal may include dysphoric mood, craving for an opioid, anxiety, nausea or vomiting, abdominal cramps, muscle aches, yawning, perspiration, hot and cold flushes, lacrimation, rhinorrhea, hypersomnia (typically in the initial phase) or insomnia, diarrhea, piloerection, and pupillary dilatation.

**Coding Note:** Code also the causing condition

**6C43.5 Opioid-induced delirium**

Opioid-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of opioids. The amount and duration of opioid use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, Behavioural, and Neurodevelopmental Disorders.

**Coding Note:** Code also the causing condition

**Inclusions:** Delirium induced by opioid withdrawal

**6C43.6 Opioid-induced psychotic disorder**

Opioid-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from opioids. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Opioid intoxication or Opioid withdrawal. The amount and duration of opioid use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the opioid use, if the symptoms persist for a substantial period of time after cessation of the opioid use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with opioid use).

**6C43.Y****Other specified disorders due to use of opioids****6C43.Z****Disorders due to use of opioids, unspecified****6C44****Disorders due to use of sedatives, hypnotics or anxiolytics**

Disorders due to use of sedatives, hypnotics or anxiolytics are characterised by the pattern and consequences of use of these substances. Sedatives, hypnotics, and anxiolytics are typically prescribed for the short-term treatment of anxiety or insomnia and are also employed to provide sedation for medical procedures. They include the benzodiazepines and the non-benzodiazepine positive allosteric modulators of GABA receptors (i.e., 'Z-drugs') as well as many other compounds. Sedatives, hypnotics, and anxiolytics include barbiturates, which are available much less commonly now than in previous decades. Sedatives, hypnotics, and anxiolytics have dependence-inducing properties that are related to the dose and duration of their use. They may cause intoxication, dependence and withdrawal. Several other mental disorders induced by sedatives, hypnotics, or anxiolytics are recognized.

**Exclusions:** Hazardous use of sedatives, hypnotics or anxiolytics (QE11.2)

**6C44.0****Episode of harmful use of sedatives, hypnotics or anxiolytics**

An episode of use of a sedative, hypnotic or anxiolytic that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to sedative, hypnotic or anxiolytic intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of sedative, hypnotic or anxiolytic use.

**Exclusions:** Sedative, hypnotic or anxiolytic dependence (6C44.2)  
Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

**6C44.1****Harmful pattern of use of sedatives, hypnotics or anxiolytics**

A pattern of sedative, hypnotic, or anxiolytic use that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of sedative, hypnotic, or anxiolytic use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

**Exclusions:** Sedative, hypnotic or anxiolytic dependence (6C44.2)  
Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)

**6C44.10****Harmful pattern of use of sedatives, hypnotics or anxiolytics, episodic**

A pattern of episodic or intermittent use of sedatives, hypnotics or anxiolytics that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of episodic or intermittent use of sedatives, hypnotics or anxiolytics is evident over a period of at least 12 months. Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

**Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)  
Sedative, hypnotic or anxiolytic dependence (6C44.2)

- 6C44.11** Harmful pattern of use of sedatives, hypnotics or anxiolytics, continuous
- A pattern of continuous use of sedatives, hypnotics or anxiolytics (daily or almost daily) that has caused clinically significant harm to a person's physical or mental health or in which behaviour induced by sedatives, hypnotics or anxiolytics has caused clinically significant harm to the health of other people. The pattern of continuous use of sedatives, hypnotics or anxiolytics is evident over a period of at least one month. Harm may be caused by the intoxicating effects of sedatives, hypnotics or anxiolytics, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.
- Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)
- Sedative, hypnotic or anxiolytic dependence (6C44.2)
- 6C44.1Z** Harmful pattern of use of sedatives, hypnotics or anxiolytics, unspecified
- 6C44.2** **Sedative, hypnotic or anxiolytic dependence**
- Sedative, hypnotic or anxiolytic dependence is a disorder of regulation of sedative use arising from repeated or continuous use of these substances. The characteristic feature is a strong internal drive to use sedatives, hypnotics, or anxiolytics, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use these substances. Physiological features of dependence may also be present, including tolerance to the effects of sedatives, hypnotics or anxiolytics, withdrawal symptoms following cessation or reduction in use, or repeated use of sedatives or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if sedative use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)
- Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)
- 6C44.20** Sedative, hypnotic or anxiolytic dependence, current use
- Current Sedative, hypnotic or anxiolytic dependence with use of a sedative, hypnotic or anxiolytic drug within the past month.
- Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)
- Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)

- 6C44.21** Sedative, hypnotic or anxiolytic dependence, early full remission  
 After a diagnosis of Sedative, hypnotic or anxiolytic dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from sedatives, hypnotics or anxiolytics during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)  
 Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)
- 6C44.22** Sedative, hypnotic or anxiolytic dependence, sustained partial remission  
 After a diagnosis of Sedative, hypnotic or anxiolytic dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in sedative, hypnotic or anxiolytic consumption for more than 12 months, such that even though sedative, hypnotic or anxiolytic use has occurred during this period, the definitional requirements for dependence have not been met.
- Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)  
 Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)
- 6C44.23** Sedative, hypnotic or anxiolytic dependence, sustained full remission  
 After a diagnosis of sedative, hypnotic or anxiolytic dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from sedative, hypnotic or anxiolytic for 12 months or longer.
- Exclusions:** Episode of harmful use of sedatives, hypnotics or anxiolytics (6C44.0)  
 Harmful pattern of use of sedatives, hypnotics or anxiolytics (6C44.1)
- 6C44.2Z** Sedative, hypnotic or anxiolytic dependence, unspecified

**6C44.3****Sedative, hypnotic or anxiolytic intoxication**

Sedative, hypnotic or anxiolytic intoxication is a clinically significant transient condition that develops during or shortly after the consumption of sedatives, hypnotics or anxiolytics that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of sedatives, hypnotics or anxiolytics and their intensity is closely related to the amount of sedatives, hypnotics or anxiolytics consumed. They are time-limited and abate as sedatives, hypnotics or anxiolytics are cleared from the body. Presenting features may include somnolence, impaired judgment, inappropriate behavior (including sexual behavior or aggression), slurred speech, impaired motor coordination, unsteady gait, mood changes, as well as impaired memory, attention and concentration. Nystagmus (repetitive, uncontrolled eye movements) is a common physical sign. In severe cases stupor or coma may occur.

**Coding Note:** Code also the causing condition

**Inclusions:** "Bad trips" due to sedatives, hypnotics or anxiolytics

**Exclusions:** sedative, hypnotic drugs and other CNS depressants poisoning (NE60)

Possession trance disorder (6B63)

**6C44.4****Sedative, hypnotic or anxiolytic withdrawal**

Sedative, hypnotic or anxiolytic withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of sedatives, hypnotics or anxiolytics in individuals who have developed dependence or have used sedatives, hypnotics or anxiolytics for a prolonged period or in large amounts. Sedative, hypnotic or anxiolytic withdrawal can also occur when prescribed sedatives, hypnotics or anxiolytics have been used in standard therapeutic doses. Presenting features of Sedative, hypnotic or anxiolytic withdrawal may include anxiety, psychomotor agitation, insomnia, increased hand tremor, nausea or vomiting, and transient visual, tactile or auditory illusions or hallucinations. There may be signs of autonomic hyperactivity (e.g., tachycardia, hypertension, sweating), or postural hypotension. The withdrawal state may be complicated by seizures. Less commonly, there may be progression to a more severe withdrawal state characterised by confusion and disorientation, delusions, and more prolonged visual, tactile or auditory hallucinations. In such cases, a separate diagnosis of Sedative, hypnotic, or anxiolytic-induced delirium should be assigned.

**Coding Note:** Code also the causing condition

**6C44.40**

Sedative, hypnotic or anxiolytic withdrawal, uncomplicated

All diagnostic requirements for Sedative, hypnotic or anxiolytic withdrawal are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.

**Coding Note:** Code also the causing condition

- 6C44.41** Sedative, hypnotic or anxiolytic withdrawal, with perceptual disturbances  
All diagnostic requirements for Sedative, hypnotic or anxiolytic withdrawal are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.
- Coding Note:** Code also the causing condition
- 6C44.42** Sedative, hypnotic or anxiolytic withdrawal, with seizures  
All diagnostic requirements for Sedative, hypnotic or anxiolytic withdrawal are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.
- Coding Note:** Code also the causing condition
- 6C44.43** Sedative, hypnotic or anxiolytic withdrawal, with perceptual disturbances and seizures  
All diagnostic requirements for Sedative, hypnotic or anxiolytic withdrawal are met and the withdrawal state is accompanied by both seizures (i.e., generalised tonic-clonic seizures) and perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. Diagnostic requirements for Delirium are not met.
- Coding Note:** Code also the causing condition
- 6C44.4Z** Sedative, hypnotic or anxiolytic withdrawal, unspecified
- Coding Note:** Code also the causing condition
- 6C44.5** **Sedative, hypnotic or anxiolytic-induced delirium**  
Sedative, hypnotic or anxiolytic-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of sedatives, hypnotics, or anxiolytics. Specific features of Sedative, hypnotic or anxiolytic-induced delirium may include confusion and disorientation, paranoid delusions, and recurrent visual, tactile or auditory hallucinations. The amount and duration of sedative, hypnotic, or anxiolytic use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.
- Coding Note:** Code also the causing condition
- Inclusions:** Delirium induced by sedative, hypnotic or anxiolytic withdrawal

**6C44.6 Sedative, hypnotic or anxiolytic-induced psychotic disorder**

Sedative, hypnotic or anxiolytic-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from sedatives, hypnotics or anxiolytics. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication or withdrawal due to sedatives, hypnotics or anxiolytics. The amount and duration of sedative, hypnotic or anxiolytic use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the sedative, hypnotic or anxiolytic use, if the symptoms persist for a substantial period of time after cessation of the sedative, hypnotic or anxiolytic use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with sedative, hypnotic or anxiolytic use).

Dementia due to use of sedatives, hypnotics or anxiolytics (6D84.1)

**6C44.70 Sedative, hypnotic or anxiolytic-induced mood disorder**

Sedative, hypnotic or anxiolytic-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from sedatives, hypnotics or anxiolytics. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of intoxication or withdrawal due to sedatives, hypnotics or anxiolytics. The amount and duration of sedative, hypnotic or anxiolytic use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the sedative, hypnotic or anxiolytic use, if the symptoms persist for a substantial period of time after cessation of the sedative, hypnotic or anxiolytic use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with sedative, hypnotic or anxiolytic use).

**Coding Note:** Code also the causing condition

**6C44.71****Sedative, hypnotic or anxiolytic-induced anxiety disorder**

Sedative, hypnotic or anxiolytic-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from sedatives, hypnotics or anxiolytics. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication or withdrawal due to sedatives, hypnotics or anxiolytics. The amount and duration of sedative, hypnotic or anxiolytic use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the sedative, hypnotic or anxiolytic use, if the symptoms persist for a substantial period of time after cessation of the sedative, hypnotic or anxiolytic use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with sedative, hypnotic or anxiolytic use).

**6C44.Y****Other specified disorders due to use of sedatives, hypnotics or anxiolytics****6C44.Z****Disorders due to use of sedatives, hypnotics or anxiolytics, unspecified****6C45****Disorders due to use of cocaine**

Disorders due to use of cocaine are characterised by the pattern and consequences of cocaine use. Cocaine is a compound found in the leaves of the coca plant, *Erythroxylum coca*, which is indigenous to countries in northern regions of South America. Cocaine has a limited place in medical treatment as an anaesthetic and vasoconstrictive agent. It is commonly used illicitly and widely available across the world, where it is found in two main forms: cocaine hydrochloride and cocaine freebase (also known as 'crack'). Cocaine is a central nervous system stimulant, and Cocaine Intoxication typically includes a state of euphoria and hyperactivity. Cocaine has potent dependence-producing properties and Cocaine Dependence is a common cause of morbidity and of clinical presentations. Cocaine Withdrawal has a characteristic course that includes lethargy and depressed mood. A range of Cocaine-Induced Mental Disorders is described.

**Exclusions:** Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone (6C46)

Hazardous use of cocaine (QE11.3)

**6C45.0 Episode of harmful use of cocaine**

An episode of use of cocaine that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to cocaine intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of cocaine use.

**Exclusions:** Cocaine dependence (6C45.2)  
Harmful pattern of use of cocaine (6C45.1)

**6C45.1 Harmful pattern of use of cocaine**

A pattern of use of cocaine that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of cocaine use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to cocaine intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of cocaine applies.

|                     | Cocaine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of cocaine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of cocaine and their intensity is closely related to the amount of cocaine consumed. They are time-limited and abate as cocaine is cleared from the body. Presenting features may include inappropriate euphoria, anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (sometimes of delusional intensity), auditory hallucinations, confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations and chest pain may be experienced. Physical signs may include tachycardia, elevated blood pressure, and pupillary dilatation. In rare instances, usually in severe intoxication, cocaine use can result in seizures, muscle weakness, dyskinesia, or dystonia. |

|                     | Cocaine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of cocaine in individuals who have developed Cocaine dependence or have used cocaine for a prolonged period or in large amounts. Presenting features of Cocaine withdrawal may include dysphoric mood, irritability, fatigue, psychomotor retardation, vivid unpleasant dreams, insomnia or hypersomnia, increased appetite, anxiety, psychomotor agitation or retardation, and craving for cocaine.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**6C45.5 Cocaine-induced delirium**

Cocaine-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of cocaine. The amount and duration of cocaine use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural, and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**6C45.6 Cocaine-induced psychotic disorder**

Cocaine-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with cocaine use).

**Coding Note:** Code also the causing condition

**6C45.60 Cocaine-induced psychotic disorder with hallucinations**

Cocaine-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of cocaine use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

**Coding Note:** Code also the causing condition

**6C45.61 Cocaine-induced psychotic disorder with delusions**

Cocaine-induced psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of cocaine use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

| <b>6C45.71</b>      | <p>Cocaine-induced anxiety disorder</p> <p>Cocaine-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with cocaine use).</p> |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>6C45.72</b> | <p>Cocaine-induced obsessive-compulsive or related disorder</p> <p>Cocaine-induced obsessive-compulsive or related disorder is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with cocaine use).</p> <p><b>Coding Note:</b> Code also the causing condition</p>                                                                                   |
| <b>6C45.73</b> | <p>Cocaine-induced impulse control disorder</p> <p>Cocaine-induced impulse control disorder is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from cocaine. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of Cocaine intoxication or Cocaine withdrawal. The amount and duration of cocaine use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the cocaine use, if the symptoms persist for a substantial period of time after cessation of the cocaine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with cocaine use).</p> <p><b>Coding Note:</b> Code also the causing condition</p> |
| <b>6C45.Y</b>  | <b>Other specified disorders due to use of cocaine</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**6C46****Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone**

Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone are characterised by the pattern and consequences of use of these substances. There is a wide array of naturally occurring and synthetically produced psychostimulants other than cocaine. The most numerous of this group are the amphetamine-type substances, including methamphetamine. Prescribed stimulants including dexamphetamine are indicated for a limited number of conditions such as for Attention Deficit Hyperactivity Disorder. Methcathinone, known in many countries as ephedrone, is a synthetic potent stimulant that is a structural analogue of methamphetamine and is related to cathinone. All these drugs have primarily psychostimulant properties and are also vasoconstrictors to a varying degree. They induce euphoria and hyperactivity as may be seen in Stimulant Intoxication. They have potent dependence-producing properties, which may lead to the diagnosis of Stimulant Dependence and Stimulant Withdrawal following the cessation of use. Several Stimulant-Induced Mental Disorders are described.

- Exclusions:**
- Disorders due to use of synthetic cathinones (6C47)
  - Disorders due to use of caffeine (6C48)
  - Disorders due to use of cocaine (6C45)
  - Hazardous use of stimulants including amphetamines or methamphetamine (QE11.4)

**6C46.0****Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone**

An episode of use of a stimulant including amphetamines, methamphetamine and methcathinone that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to stimulant intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of stimulant including amphetamines, methamphetamine and methcathinone use.

- Exclusions:**
- Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)
  - Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

**6C46.1****Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone**

A pattern of use of stimulants including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of stimulant use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to stimulant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone applies.

**Exclusions:**

Harmful pattern of use of caffeine (6C48.1)

Harmful pattern of use of cocaine (6C45.1)

Harmful pattern of use of synthetic cathinones (6C47.1)

Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

**6C46.10****Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone, episodic**

A pattern of episodic or intermittent use of stimulants including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic stimulant use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to stimulant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone applies.

**Exclusions:**

Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)

Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)

- 6C46.11** Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone, continuous
- A pattern of use of stimulants including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of stimulant use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to stimulant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone applies.
- Exclusions:** Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)
- Stimulant dependence including amphetamines, methamphetamine or methcathinone (6C46.2)
- 6C46.1Z** Harmful pattern of use of stimulants including amphetamines, methamphetamine and methcathinone, unspecified
- 6C46.2** **Stimulant dependence including amphetamines, methamphetamine or methcathinone**
- Stimulant dependence including amphetamines, methamphetamine or methcathinone is a disorder of regulation of stimulant use arising from repeated or continuous use of stimulants. The characteristic feature is a strong internal drive to use stimulants, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use stimulants. Physiological features of dependence may also be present, including tolerance to the effects of stimulants, withdrawal symptoms following cessation or reduction in use of stimulants, or repeated use of stimulants or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if stimulant use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Cocaine dependence (6C45.2)
- Synthetic cathinone dependence (6C47.2)
- Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)
- Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)

- 6C46.20** Stimulant dependence including amphetamines, methamphetamine or methcathinone, current use
- Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones refers to amphetamine or other stimulant use within the past month.
- Exclusions:** Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)
- Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)
- 6C46.21** Stimulant dependence including amphetamines, methamphetamine or methcathinone, early full remission
- After a diagnosis of Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from stimulants during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)
- Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)
- 6C46.22** Stimulant dependence including amphetamines, methamphetamine or methcathinone, sustained partial remission
- After a diagnosis of Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in amphetamine or other stimulant consumption for more than 12 months, such that even though amphetamine or other stimulant use has occurred during this period, the definitional requirements for dependence have not been met.
- Exclusions:** Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)
- Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)
- 6C46.23** Stimulant dependence including amphetamines, methamphetamine or methcathinone, sustained full remission
- After a diagnosis of Stimulant dependence including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from amphetamine or other stimulants for 12 months or longer.
- Exclusions:** Episode of harmful use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.0)
- Harmful pattern of use of stimulants including amphetamines, methamphetamine or methcathinone (6C46.1)
- 6C46.2Z** Stimulant dependence including amphetamines, methamphetamine or methcathinone, unspecified

**6C46.3      Stimulant intoxication including amphetamines, methamphetamine or methcathinone**

Stimulant intoxication including amphetamines, methamphetamine and methcathinone but excluding caffeine, cocaine and synthetic cathinones is a clinically significant transient condition that develops during or shortly after the consumption of amphetamine or other stimulants that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of amphetamine or other stimulants and their intensity is closely related to the amount of amphetamine or other stimulant consumed. They are time-limited and abate as amphetamine or another stimulant is cleared from the body. Presenting features may include anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (possibly of delusional intensity), transient auditory hallucinations, transitory confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations may be experienced. Physical signs may include tachycardia, elevated blood pressure, pupillary dilatation, dyskinesias and dystonias, and skin sores. In rare instances, usually in severe intoxication, use of stimulants including amphetamines, methamphetamine and methcathinone can result in seizures.

**Coding Note:** Code also the causing condition

**Exclusions:**            amphetamine poisoning (NE60)  
                                Caffeine intoxication (6C48.2)  
                                Cocaine intoxication (6C45.3)  
                                Synthetic cathinone intoxication (6C47.3)  
                                Possession trance disorder (6B63)

**6C46.4      Stimulant withdrawal including amphetamines, methamphetamine or methcathinone**

Stimulant withdrawal including amphetamines, methamphetamine and methcathinone is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of stimulants in individuals who have developed Stimulant dependence or have used stimulants for a prolonged period or in large amounts. Stimulant withdrawal can also occur when prescribed stimulants have been used in standard therapeutic doses. Presenting features of stimulant withdrawal may include dysphoric mood, irritability, fatigue, insomnia or (more commonly) hypersomnia, vivid and unpleasant dreams, increased appetite, psychomotor agitation or retardation, and craving for amphetamine or related stimulants.

**Coding Note:** Code also the causing condition

**Exclusions:**            Cocaine withdrawal (6C45.4)  
                                Caffeine withdrawal (6C48.3)  
                                Synthetic cathinone withdrawal (6C47.4)

**6C46.5      Stimulant-induced delirium including amphetamines, methamphetamine or methcathinone**

Stimulant-induced delirium including amphetamines, methamphetamine and methcathinone is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of stimulants. The amount and duration of stimulant use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**Exclusions:**            Cocaine-induced delirium (6C45.5)  
                              Synthetic cathinone-induced delirium (6C47.5)  
                              Disorders due to use of caffeine (6C48)

**6C46.6      Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone**

Stimulant-induced psychotic disorder including amphetamines, methamphetamine and methcathinone is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with use of stimulants).

**Coding Note:** Code also the causing condition

**Exclusions:**            Cocaine-induced psychotic disorder (6C45.6)  
                              Synthetic cathinone-induced psychotic disorder (6C47.6)  
                              Disorders due to use of caffeine (6C48)

**6C46.60** Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone with hallucinations

Stimulant-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of stimulant use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

**Coding Note:** Code also the causing condition

**Exclusions:** Cocaine-induced psychotic disorder with hallucinations (6C45.60)  
Disorders due to use of caffeine (6C48)  
Synthetic cathinone-induced psychotic disorder with hallucinations (6C47.60)

**6C46.61** Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone with delusions

Stimulant-induced psychotic disorder including amphetamines, methamphetamine and methcathinone is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with use of stimulants).

**Coding Note:** Code also the causing condition

**Exclusions:** Disorders due to use of caffeine (6C48)  
Cocaine-induced psychotic disorder with delusions (6C45.61)  
Synthetic cathinone-induced psychotic disorder with delusions (6C47.61)

- 6C46.62** Stimulant-induced psychotic disorder including amphetamines but excluding caffeine or cocaine with mixed psychotic symptoms
- Stimulant-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of stimulant use. The symptoms do not occur exclusively during hypnagogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., Schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).
- Coding Note:** Code also the causing condition
- Exclusions:**
- Disorders due to use of caffeine (6C48)
  - Cocaine-induced psychotic disorder with mixed psychotic symptoms (6C45.62)
  - Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms (6C47.62)
- 6C46.6Z** Stimulant-induced psychotic disorder including amphetamines, methamphetamine or methcathinone, unspecified
- Coding Note:** Code also the causing condition
- 6C46.7** **Certain specified stimulant-induced mental or behavioural disorders including amphetamines, methamphetamine or methcathinone**
- Coding Note:** Code also the causing condition
- 6C46.70** Stimulant-induced mood disorder including amphetamines, methamphetamine or methcathinone
- Stimulant-induced mood disorder including amphetamines, methamphetamine and methcathinone is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with use of stimulants).
- Coding Note:** Code also the causing condition
- Exclusions:**
- Synthetic cathinone-induced mood disorder (6C47.70)
  - Cocaine-induced mood disorder (6C45.70)
  - Disorders due to use of caffeine (6C48)

**6C46.71** Stimulant-induced anxiety disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced anxiety disorder including amphetamines, methamphetamine and methcathinone is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication or withdrawal due to stimulants. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with use of stimulants).

**Coding Note:** Code also the causing condition

**Exclusions:** Cocaine-induced anxiety disorder (6C45.71)  
Caffeine-induced anxiety disorder (6C48.40)  
Synthetic cathinone-induced anxiety disorder (6C47.71)

**6C46.72** Stimulant-induced obsessive-compulsive or related disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced obsessive-compulsive or related disorder including amphetamines, methamphetamine and methcathinone is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from stimulants. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with stimulant use).

**Coding Note:** Code also the causing condition

**Exclusions:** Cocaine-induced obsessive-compulsive or related disorder (6C45.72)  
Synthetic cathinone-induced obsessive-compulsive or related syndrome (6C47.72)  
Disorders due to use of caffeine (6C48)

**6C46.73** Stimulant-induced impulse control disorder including amphetamines, methamphetamine or methcathinone

Stimulant-induced impulse control disorder including amphetamines, methamphetamine and methcathinone is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from stimulants. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of Stimulant intoxication or Stimulant withdrawal. The amount and duration of stimulant use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the stimulant use, if the symptoms persist for a substantial period of time after cessation of the stimulant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with stimulant use).

**Coding Note:** Code also the causing condition

**6C46.Y Other specified disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone**

**6C46.Z Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone, unspecified**

## **6C47 Disorders due to use of synthetic cathinones**

Disorders due to use of synthetic cathinones are characterised by the pattern and consequences of synthetic cathinone use. Synthetic cathinones (also known as 'bath salts') are synthetic compounds with stimulant properties related to cathinone found in the khat plant, *Catha edulis*. The use of synthetic cathinones is common in young populations in many countries. They may produce a range of disorders including Synthetic Cathinone Intoxication, Synthetic Cathinone Dependence and Synthetic Cathinone Withdrawal. Several synthetic cathinone-induced mental disorders are recognised.

### **6C47.0 Episode of harmful use of synthetic cathinones**

An episode of synthetic cathinone use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to synthetic cathinone intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of synthetic cathinone use.

**Exclusions:** Harmful pattern of use of synthetic cathinones (6C47.1)  
Synthetic cathinone dependence (6C47.2)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>6C47.2</b>  | <b>Synthetic cathinone dependence</b><br><p>Synthetic cathinone dependence is a disorder of regulation of synthetic cathinone use arising from repeated or continuous use of synthetic cathinones. The characteristic feature is a strong internal drive to use synthetic cathinones, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use synthetic cathinones. Physiological features of dependence may also be present, including tolerance to the effects of synthetic cathinones, withdrawal symptoms following cessation or reduction in use of synthetic cathinones, or repeated use of synthetic cathinones or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if synthetic cathinone use is continuous (daily or almost daily) for at least 3 months.</p> <p><b>Exclusions:</b> Harmful pattern of use of synthetic cathinones (6C47.1)<br/> Episode of harmful use of synthetic cathinones (6C47.0)</p> |

| <b>6C47.2Y</b> | Other specified synthetic cathinone dependence                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**6C47.2Z** Synthetic cathinone dependence, unspecified

**6C47.3 Synthetic cathinone intoxication**

Synthetic cathinone intoxication is a clinically significant transient condition that develops during or shortly after the consumption of synthetic cathinones that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of synthetic cathinones and their intensity is closely related to the amount of synthetic cathinones consumed. They are time-limited and abate as the synthetic cathinone is cleared from the body. Presenting features may include anxiety, anger, impaired attention, hypervigilance, psychomotor agitation, paranoid ideation (possibly of delusional intensity), transient auditory hallucinations, transitory confusion, and changes in sociability. Perspiration or chills, nausea or vomiting, and palpitations may be experienced. Physical signs may include tachycardia, elevated blood pressure, pupillary dilatation, dyskinesias and dystonias, and skin sores. In rare instances, usually in severe intoxication, use of synthetic cathinones can result in seizures.

**Coding Note:** Code also the causing condition

**6C47.4 Synthetic cathinone withdrawal**

Synthetic cathinone withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of synthetic cathinones in individuals who have developed Synthetic cathinone dependence or have used synthetic cathinones for a prolonged period or in large amounts. Presenting features of Synthetic cathinone withdrawal may include dysphoric mood, irritability, fatigue, insomnia or (more commonly) hypersomnia, vivid and unpleasant dreams, increased appetite, psychomotor agitation or retardation, and craving for stimulants, including synthetic cathinones.

**Coding Note:** Code also the causing condition

**6C47.5 Synthetic cathinone-induced delirium**

Synthetic cathinone-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of synthetic cathinones. The amount and duration of synthetic cathinone use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**6C47.6 Synthetic cathinone-induced psychotic disorder**

Synthetic cathinone-induced psychotic disorder is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

**Coding Note:** Code also the causing condition

**6C47.60 Synthetic cathinone-induced psychotic disorder with hallucinations**

Synthetic cathinone-induced psychotic disorder with hallucinations is characterised by the presence of hallucinations that are judged to be the direct consequence of synthetic cathinone use. Neither delusions nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

**Coding Note:** Code also the causing condition

**6C47.61 Synthetic cathinone-induced psychotic disorder with delusions**

Synthetic cathinone psychotic disorder with delusions is characterised by the presence of delusions that are judged to be the direct consequence of synthetic cathinone use. Neither hallucinations nor other psychotic symptoms are present. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

**Coding Note:** Code also the causing condition

**6C47.62 Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms**

Synthetic cathinone-induced psychotic disorder with mixed psychotic symptoms is characterised by the presence of multiple psychotic symptoms, primarily hallucinations and delusions, when these are judged to be the direct consequence of synthetic cathinone use. The symptoms do not occur exclusively during hypnogogic or hypnopompic states, are not better accounted for by another mental and behavioural disorder (e.g., Schizophrenia), and are not due to another disorder or disease classified elsewhere (e.g., epilepsies with visual symptoms).

**Coding Note:** Code also the causing condition

**6C47.6Z Synthetic cathinone-induced psychotic disorder, unspecified**

**Coding Note:** Code also the causing condition

**6C47.7                    Certain specified synthetic cathinone-induced mental or behavioural disorders**

**Coding Note:**     Code also the causing condition

**6C47.70                Synthetic cathinone-induced mood disorder**

Synthetic cathinone-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

**Coding Note:**     Code also the causing condition

**6C47.71                Synthetic cathinone-induced anxiety disorder**

Synthetic cathinone-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

**Coding Note:**     Code also the causing condition

**6C47.72** Synthetic cathinone-induced obsessive-compulsive or related syndrome

Synthetic cathinone-induced obsessive-compulsive or related disorder is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

**Coding Note:** Code also the causing condition

**6C47.73** Synthetic cathinone-induced impulse control disorder

Synthetic cathinone-induced impulse control disorder is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from synthetic cathinones. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of Synthetic cathinone intoxication or Synthetic cathinone withdrawal. The amount and duration of synthetic cathinone use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the synthetic cathinone use, if the symptoms persist for a substantial period of time after cessation of the synthetic cathinone use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with synthetic cathinone use).

**Coding Note:** Code also the causing condition

**6C47.Y** Other specified disorders due to use of synthetic cathinones

**6C47.Z** Disorders due to use of synthetic cathinones, unspecified

**6C48****Disorders due to use of caffeine**

Disorders due to use of caffeine are characterised by the pattern and consequences of caffeine use. Caffeine is a mild psychostimulant and diuretic that is found in the beans of the coffee plant (*Coffea* species) and is a constituent of coffee, cola drinks, chocolate, a range of proprietary 'energy drinks' and weight-loss aids. It is the most commonly used psychoactive substance worldwide and several clinical conditions related to its use are described, although severe disorders are comparatively rare considering its ubiquity. Caffeine Intoxication related to consumption of relatively higher doses (i.e., > 1 g per day) is described. Caffeine Withdrawal is common upon cessation of use among individuals who have used caffeine for a prolonged period or in large amounts. Caffeine-Induced Anxiety Disorder has been described, often following intoxication or heavy use.

**Exclusions:** Disorders due to use of stimulants including amphetamines, methamphetamine or methcathinone (6C46)  
Hazardous use of caffeine (QE11.5)

**6C48.0****Episode of harmful use of caffeine**

An episode of caffeine use that has caused damage to a person's physical or mental health. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of caffeine use.

**Exclusions:** Harmful pattern of use of caffeine (6C48.1)

**6C48.1****Harmful pattern of use of caffeine**

A pattern of caffeine use that has caused clinically significant harm to a person's physical or mental health or in which caffeine-induced behaviour has caused clinically significant harm to the health of other people. The pattern of caffeine use is evident over a period of at least 12 months if use is episodic and at least one month if use is continuous (i.e., daily or almost daily). Harm may be caused by the intoxicating effects of caffeine, the direct or secondary toxic effects on body organs and systems, or a harmful route of administration.

**Exclusions:** Episode of harmful use of caffeine (6C48.0)

**6C48.10****Harmful pattern of use of caffeine, episodic**

A pattern of episodic or intermittent caffeine use that has caused damage to a person's physical or mental health. The pattern of episodic caffeine use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

**Exclusions:** Episode of harmful use of caffeine (6C48.0)

**6C48.11****Harmful pattern of use of caffeine, continuous**

A pattern of continuous (daily or almost daily) caffeine use that has caused damage to a person's physical or mental health. The pattern of continuous caffeine use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.

**Exclusions:** Episode of harmful use of caffeine (6C48.0)

**6C48.1Z** Harmful pattern of use of caffeine, unspecified

**6C48.2 Caffeine intoxication**

Caffeine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of caffeine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of caffeine and their intensity is closely related to the amount of caffeine consumed. They are time-limited and abate as caffeine is cleared from the body. Presenting features may include restlessness, anxiety, excitement, insomnia, flushed face, tachycardia, diuresis, gastrointestinal disturbances, muscle twitching, psychomotor agitation, perspiration or chills, and nausea or vomiting. Cardiac arrhythmias may occur. Disturbances typical of intoxication tend to occur at relatively higher doses (e.g., > 1 g per day). Very high doses of caffeine (e.g., > 5 g) can result in respiratory distress or seizures and can be fatal.

**Coding Note:** Code also the causing condition

**6C48.3 Caffeine withdrawal**

Caffeine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of caffeine (typically in the form of coffee, caffeinated drinks, or as an ingredient in certain over-the-counter medications) in individuals who have used caffeine for a prolonged period or in large amounts. Presenting features of Caffeine withdrawal may include headache, marked fatigue or drowsiness, irritability, depressed or dysphoric mood, nausea or vomiting, and difficulty concentrating.

**Coding Note:** Code also the causing condition

**6C48.4 Certain specified caffeine-induced mental or behavioural disorders**

**Coding Note:** Code also the causing condition

**6C48.40 Caffeine-induced anxiety disorder**

Caffeine-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from caffeine. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Caffeine intoxication or Caffeine withdrawal. The amount and duration of caffeine use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the caffeine use, if the symptoms persist for a substantial period of time after cessation of the caffeine use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with caffeine use).

**Coding Note:** Code also the causing condition

**6C48.Y Other specified disorders due to use of caffeine**

**6C48.Z Disorders due to use of caffeine, unspecified**

**6C49****Disorders due to use of hallucinogens**

Disorders due to use of hallucinogens are characterised by the pattern and consequences of hallucinogen use. Several thousand compounds have hallucinogenic properties, many of which are found in plants (e.g., mescaline) and fungi (e.g., psilocybin) or are chemically synthesized (e.g., lysergic acid diethylamide [LSD]). These compounds have primarily hallucinogenic properties, but some may also be stimulants. Much of the morbidity associated with these compounds arises from the acute effects related to Hallucinogen Intoxication. Hallucinogen Dependence is rare and Hallucinogen Withdrawal is not described. Among the mental disorders related to hallucinogen use, Hallucinogen-Induced Psychotic Disorder is the most frequently seen, although worldwide it is still fairly uncommon.

**6C49.0****Episode of harmful use of hallucinogens**

An episode of hallucinogen use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to hallucinogen intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of hallucinogen use.

**Exclusions:** Hallucinogen dependence (6C49.2)  
Harmful pattern of use of hallucinogens (6C49.1)

**6C49.1****Harmful pattern of use of hallucinogens**

A pattern of use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of hallucinogen use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of hallucinogens applies.

**Exclusions:** Hallucinogen dependence (6C49.2)  
Episode of harmful use of hallucinogens (6C49.0)

- 6C49.10** Harmful pattern of use of hallucinogens, episodic
- A pattern of episodic or intermittent use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic hallucinogen use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of hallucinogens applies.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Hallucinogen dependence (6C49.2)
- 6C49.11** Harmful pattern of use of hallucinogens, continuous
- A pattern of continuous (daily or almost daily) use of hallucinogens that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous hallucinogen use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to hallucinogen intoxication on the part of the person to whom the diagnosis of Harmful use of hallucinogens applies.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Hallucinogen dependence (6C49.2)
- 6C49.1Z** Harmful pattern of use of hallucinogens, unspecified
- 6C49.2** **Hallucinogen dependence**
- Hallucinogen dependence is a disorder of regulation of hallucinogen use arising from repeated or continuous use of hallucinogens. The characteristic feature is a strong internal drive to use hallucinogens, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use hallucinogens. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if hallucinogens use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Harmful pattern of use of hallucinogens (6C49.1)
- 6C49.20** Hallucinogen dependence, current use
- Current hallucinogen dependence with hallucinogen use within the past month.
- Exclusions:** Episode of harmful use of hallucinogens (6C49.0)  
Harmful pattern of use of hallucinogens (6C49.1)

- 6C49.21**      Hallucinogen dependence, early full remission  
 After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from hallucinogens during a period lasting between 1 and 12 months.
- Exclusions:**      Episode of harmful use of hallucinogens (6C49.0)  
                          Harmful pattern of use of hallucinogens (6C49.1)
- 6C49.22**      Hallucinogen dependence, sustained partial remission  
 After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in hallucinogen consumption for more than 12 months, such that even though intermittent or continuing hallucinogen use has occurred during this period, the definitional requirements for dependence have not been met.
- Exclusions:**      Episode of harmful use of hallucinogens (6C49.0)  
                          Harmful pattern of use of hallucinogens (6C49.1)
- 6C49.23**      Hallucinogen dependence, sustained full remission  
 After a diagnosis of Hallucinogen dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from hallucinogens for 12 months or longer.
- Exclusions:**      Episode of harmful use of hallucinogens (6C49.0)  
                          Harmful pattern of use of hallucinogens (6C49.1)
- 6C49.2Z**      Hallucinogen dependence, unspecified
- 6C49.3**      **Hallucinogen intoxication**  
 Hallucinogen intoxication is a clinically significant transient condition that develops during or shortly after the consumption of hallucinogens that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of hallucinogens and their intensity is closely related to the amount of hallucinogen consumed. They are time-limited and abate as the hallucinogen is cleared from the body. Presenting features may include hallucinations, illusions, perceptual changes such as depersonalisation, derealization, or synesthesias (blending of senses, such as a visual stimulus evoking a smell), anxiety, depressed or dysphoric mood, ideas of reference, paranoid ideation, impaired judgment, palpitations, sweating, blurred vision, tremors and incoordination. Physical signs may include tachycardia, elevated blood pressure, and pupillary dilatation. In rare instances, hallucinogen intoxication may facilitate suicidal ideation and behaviour.
- Coding Note:**      Code also the causing condition
- Exclusions:**      hallucinogens poisoning (NE60)  
                          Possession trance disorder (6B63)

**6C49.4            Hallucinogen-induced delirium**

Hallucinogen-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of hallucinogens. The amount and duration of hallucinogen use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:**     Code also the causing condition

**6C49.5            Hallucinogen-induced psychotic disorder**

Hallucinogen-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with hallucinogen use).

**Coding Note:**     Code also the causing condition

**Exclusions:**            Psychotic disorder induced by other specified psychoactive substance (6C4E.6)  
                                 Alcohol-induced psychotic disorder (6C40.6)

**6C49.6            Certain specified hallucinogen-induced mental or behavioural disorders**

**Coding Note:**     Code also the causing condition

**6C49.60           Hallucinogen-induced mood disorder**

Hallucinogen-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with hallucinogen use).

**Coding Note:**     Code also the causing condition

**6C49.61**      Hallucinogen-induced anxiety disorder

Hallucinogen-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with hallucinogens. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of hallucinogen intoxication. The amount and duration of hallucinogen use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the hallucinogen use, if the symptoms persist for a substantial period of time after cessation of the hallucinogen use, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with hallucinogen use).

**Coding Note:**      Code also the causing condition

**6C49.Y**      **Other specified disorders due to use of hallucinogens**

**6C49.Z**      **Disorders due to use of hallucinogens, unspecified**

**6C4A**      **Disorders due to use of nicotine**

Disorders due to use of nicotine are characterised by the pattern and consequences of nicotine use. Nicotine is the active dependence-producing constituent of the tobacco plant, *Nicotiana tabacum*. Nicotine is used overwhelmingly through smoking cigarettes. Increasingly, it is also used in electronic cigarettes that vaporize nicotine dissolved in a carrier solvent for inhalation (i.e., “vaping”). Pipe smoking, chewing tobacco and inhaling snuff are minor forms of use. Nicotine is a highly potent addictive compound and is the third most common psychoactive substance used worldwide after caffeine and alcohol. Nicotine Dependence and Nicotine Withdrawal are well described and Nicotine-Induced Mental Disorders are recognized.

**6C4A.0**      **Episode of harmful use of nicotine**

An episode of nicotine use that has caused damage to a person’s physical or mental health. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of nicotine use.

**Exclusions:**      Nicotine dependence (6C4A.2)  
                         Harmful pattern of use of nicotine (6C4A.1)  
                         Harmful effects of or exposure to noxious substances, chiefly  
                         nonmedicinal as to source, not elsewhere classified  
                         (NE61)

- 6C4A.1 Harmful pattern of use of nicotine**  
 A pattern of nicotine use that has caused damage to a person's physical or mental health. The pattern of nicotine use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.
- Exclusions:** Nicotine dependence (6C4A.2)  
 Episode of harmful use of nicotine (6C4A.0)
- 6C4A.10 Harmful pattern of use of nicotine, episodic**  
 A pattern of episodic or intermittent nicotine use that has caused damage to a person's physical or mental health. The pattern of episodic nicotine use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.
- Exclusions:** Episode of harmful use of nicotine (6C4A.0)  
 Nicotine dependence (6C4A.2)
- 6C4A.11 Harmful pattern of use of nicotine, continuous**  
 A pattern of continuous (daily or almost daily) nicotine use that has caused damage to a person's physical or mental health. The pattern of continuous nicotine use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration.
- Exclusions:** Episode of harmful use of nicotine (6C4A.0)  
 Nicotine dependence (6C4A.2)
- 6C4A.1Z Harmful pattern of use of nicotine, unspecified**
- 6C4A.2 Nicotine dependence**  
 Nicotine dependence is a disorder of regulation of nicotine use arising from repeated or continuous use of nicotine. The characteristic feature is a strong internal drive to use nicotine, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use nicotine. Physiological features of dependence may also be present, including tolerance to the effects of nicotine, withdrawal symptoms following cessation or reduction in use of nicotine, or repeated use of nicotine or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if nicotine use is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of nicotine (6C4A.0)  
 Harmful pattern of use of nicotine (6C4A.1)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>6C4A.3</b>  | <p><b>Nicotine intoxication</b></p> <p>Nicotine intoxication is a clinically significant transient condition that develops during or shortly after the consumption of nicotine that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of nicotine and their intensity is closely related to the amount of nicotine consumed. They are time-limited and abate as nicotine is cleared from the body. Presenting features may include restlessness, psychomotor agitation, anxiety, cold sweats, headache, insomnia, palpitations, paresthesias, nausea or vomiting, abdominal cramps, confusion, bizarre dreams, burning sensations in the mouth, and salivation. In rare instances, paranoid ideation, perceptual disturbances, convulsions or coma may occur. Nicotine intoxication occurs more commonly in naïve (non-tolerant) users or among those taking higher than accustomed doses.</p> <p><b>Coding Note:</b> Code also the causing condition</p> <p><b>Inclusions:</b> "Bad trips" due to nicotine</p> <p><b>Exclusions:</b> intoxication meaning poisoning (NE61)<br/>Possession trance disorder (6B63)</p> |

**6C4A.4 Nicotine withdrawal**

Nicotine withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of nicotine (typically used as a constituent of tobacco) in individuals who have developed Nicotine dependence or have used nicotine for a prolonged period or in large amounts. Presenting features of Nicotine withdrawal may include dysphoric or depressed mood, insomnia, irritability, anger, anxiety, difficulty concentrating, restlessness, bradycardia, increased appetite, and craving for tobacco (or other nicotine-containing products). Other physical symptoms may include increased cough and mouth ulceration.

**Coding Note:** Code also the causing condition

**6C4A.Y Other specified disorders due to use of nicotine****6C4A.Z Disorders due to use of nicotine, unspecified****6C4B Disorders due to use of volatile inhalants**

Disorders due to use of volatile inhalants are characterised by the pattern and consequences of volatile inhalant use. Volatile inhalants include a range of compounds that are in the gaseous or vapour phase at ambient temperatures and include various organic solvents, glues, gasoline (petrol), nitrites and gases such as nitrous oxide, trichloroethane, butane, toluene, fluorocarbons, ether and halothane. They have a range of pharmacological properties but are predominantly central nervous system depressants, with many also having vasoactive effects. They tend to be used by younger persons and may be used when access to alternative psychoactive substances is difficult or impossible. Volatile Inhalant Intoxication is well recognized. Volatile inhalants have dependence-producing properties and Volatile Inhalant Dependence and Volatile Inhalant Withdrawal is recognized although comparatively uncommon worldwide. Volatile Inhalant-Induced Mental Disorders are described. They may also cause neurocognitive impairment, including Dementia.

**6C4B.0 Episode of harmful use of volatile inhalants**

An episode of volatile inhalant use or unintentional exposure (e.g., occupational exposure) that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to volatile inhalant intoxication on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of volatile inhalant use.

**Exclusions:** Harmful pattern of use of volatile inhalants (6C4B.1)  
Volatile inhalant dependence (6C4B.2)

**6C4B.1 Harmful pattern of use of volatile inhalants**

A pattern of volatile inhalant use that has caused damage to a person's physical or mental health. The pattern of volatile inhalant use is evident over a period of at least 12 months if substance use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (1) direct or secondary toxic effects on body organs and systems; or (2) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to volatile inhalant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of volatile inhalants applies.

**Exclusions:** Volatile inhalant dependence (6C4B.2)  
Episode of harmful use of volatile inhalants (6C4B.0)

**6C4B.10 Harmful pattern of use of volatile inhalants, episodic**

A pattern of episodic or intermittent volatile inhalant use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic volatile inhalant use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to volatile inhalant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of volatile inhalants applies.

**Exclusions:** Episode of harmful use of volatile inhalants (6C4B.0)  
Volatile inhalant dependence (6C4B.2)

**6C4B.11 Harmful pattern of use of volatile inhalants, continuous**

A pattern of continuous (daily or almost daily) volatile inhalant use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous volatile inhalant use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to volatile inhalant intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of volatile inhalants applies.

**Exclusions:** Episode of harmful use of volatile inhalants (6C4B.0)  
Volatile inhalant dependence (6C4B.2)

**6C4B.12 Harmful pattern of use of volatile inhalants, unspecified**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>6C4B.2</b>  | <b>Volatile inhalant dependence</b><br>Volatile inhalant dependence is a disorder of regulation of volatile inhalant use arising from repeated or continuous use of volatile inhalants. The characteristic feature is a strong internal drive to use volatile inhalants, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use volatile inhalants. Physiological features of dependence may also be present, including tolerance to the effects of volatile inhalants, withdrawal symptoms following cessation or reduction in use of volatile inhalants, or repeated use of volatile inhalants or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if volatile inhalant use is continuous (daily or almost daily) for at least 3 months. |

**6C4B.3 Volatile inhalant intoxication**

Volatile inhalant intoxication is a clinically significant transient condition that develops during or shortly after the consumption of a volatile inhalant that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of volatile inhalants and their intensity is closely related to the amount of volatile inhalant consumed. They are time-limited and abate as the volatile inhalant is cleared from the body. Presenting features may include euphoria, impaired judgment, aggression, somnolence, stupor or coma, dizziness, tremor, lack of coordination, slurred speech, unsteady gait, lethargy and apathy, psychomotor retardation, and visual disturbances. Muscle weakness and diplopia may occur. Use of volatile inhalants may cause cardiac arrhythmia, cardiac arrest, and death. Inhalants containing lead (e.g. some forms of petrol/gasoline) may cause confusion, irritability, coma and seizures.

**Coding Note:** Code also the causing condition

**Exclusions:** Possession trance disorder (6B63)

**6C4B.4 Volatile inhalant withdrawal**

Volatile inhalant withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of volatile inhalants in individuals who have developed Volatile inhalant dependence or have used volatile inhalants for a prolonged period or in large amounts. Presenting features of Volatile inhalant withdrawal may include insomnia, anxiety, irritability, dysphoric mood, shakiness, perspiration, nausea, and transient illusions.

**Coding Note:** Code also the causing condition

**6C4B.5 Volatile inhalant-induced delirium**

Volatile inhalant-induced delirium is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of volatile inhalants. The amount and duration of volatile inhalant use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6C4B.6****Volatile inhalant-induced psychotic disorder**

Volatile inhalant-induced psychotic disorder is characterised by psychotic symptoms (e.g. delusions, hallucinations, disorganized thinking, grossly disorganized behaviour) that develop during or soon after intoxication with or withdrawal from volatile inhalants. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Volatile inhalant intoxication or Volatile inhalant withdrawal. The amount and duration of volatile inhalant use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g. Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the volatile inhalant use, if the symptoms persist for a substantial period of time after cessation of the volatile inhalant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g. a history of prior episodes not associated with volatile inhalant use).

**Coding Note:** Code also the causing condition

**6C4B.7****Certain specified volatile inhalants-induced mental or behavioural disorders**

**Coding Note:** Code also the causing condition

**6C4B.70****Volatile inhalant-induced mood disorder**

Volatile inhalant-induced mood disorder is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from volatile inhalants. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of Volatile inhalant intoxication or Volatile inhalant withdrawal. The amount and duration of volatile inhalant use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the volatile inhalant use, if the symptoms persist for a substantial period of time after cessation of the volatile inhalant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with volatile inhalant use).

**Coding Note:** Code also the causing condition

**6C4B.71****Volatile inhalant-induced anxiety disorder**

Volatile inhalant-induced anxiety disorder is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from volatile inhalants. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of Volatile inhalant intoxication or Volatile inhalant withdrawal. The amount and duration of volatile inhalant use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and Fear-Related Disorder, a Depressive Disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the volatile inhalant use, if the symptoms persist for a substantial period of time after cessation of the volatile inhalant use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with volatile inhalant use).

**Coding Note:** Code also the causing condition

**6C4B.Y****Other specified disorders due to use of volatile inhalants****6C4B.Z****Disorders due to use of volatile inhalants, unspecified****6C4C****Disorders due to use of MDMA or related drugs, including MDA**

Disorders due to use of MDMA or related drugs, including MDA are characterised by the pattern and consequences of MDMA or related drug use. MDMA is methylene-dioxymethamphetamine and is a common drug of abuse in many countries especially among young people. It is predominantly available in tablet form known as 'ecstasy'. Pharmacologically, MDMA has stimulant and empathogenic properties and these encourage its use among young people for social and other interactions. Considering its wide prevalence in many countries and among many sub-groups of young people, MDMA and Related Drug Dependence and MDMA and Related Drug Withdrawal are comparatively uncommon. Substance-Induced Mental Disorders may arise from its use. Several analogues of MDMA exist, including MDA (methylene-dioxyamphetamine).

**Exclusions:** Hazardous use of MDMA or related drugs (QE11.6)

**6C4C.0****Episode of harmful use of MDMA or related drugs, including MDA**

An episode of use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to intoxication with MDMA or related drugs, including MDA, on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of MDMA or related drugs, including MDA.

**Exclusions:** Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

MDMA or related drug dependence, including MDA (6C4C.2)

**6C4C.1****Harmful pattern of use of MDMA or related drugs, including MDA**

A pattern of use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of use of MDMA or related drugs is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to MDMA or related drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of MDMA or related drugs, including MDA applies.

**Exclusions:**

MDMA or related drug dependence, including MDA (6C4C.2)

Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

**6C4C.10****Harmful use of MDMA or related drugs, including MDA, episodic**

A pattern of episodic or intermittent use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic use of MDMA or related drugs is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to MDMA or related drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of MDMA or related drugs, including MDA applies.

**Exclusions:**

Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

MDMA or related drug dependence, including MDA (6C4C.2)

**6C4C.11****Harmful use of MDMA or related drugs, including MDA, continuous**

A pattern of continuous (daily or almost daily) use of MDMA or related drugs, including MDA, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous use of MDMA or related drugs is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to MDMA or related drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of MDMA or related drugs, including MDA applies.

**Exclusions:**

Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

MDMA or related drug dependence, including MDA (6C4C.2)

**6C4C.12****Harmful pattern of use of MDMA or related drugs, including MDA, unspecified**

**6C4C.2****MDMA or related drug dependence, including MDA**

MDMA or related drug dependence, including MDA is a disorder of regulation of MDMA or related drug use arising from repeated or continuous use of MDMA or related drugs. The characteristic feature is a strong internal drive to use MDMA or related drugs, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use MDMA or related drugs. Physiological features of dependence may also be present, including tolerance to the effects of MDMA or related drugs, withdrawal symptoms following cessation or reduction in use of MDMA or related drugs, or repeated use of MDMA or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if MDMA or related drug use is continuous (daily or almost daily) for at least 3 months.

**Exclusions:** Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

**6C4C.20**

MDMA or related drug dependence, including MDA, current use

Current MDMA or related drug dependence, including MDA, with MDMA or related drug use within the past month.

**Exclusions:** Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

**6C4C.21**

MDMA or related drug dependence, including MDA, early full remission

After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from MDMA or related drug dependence, including MDA, during a period lasting from between 1 and 12 months.

**Exclusions:** Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

**6C4C.22**

MDMA or related drug dependence, including MDA, sustained partial remission

After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of MDMA or related drugs, including MDA, for more than 12 months, such that even though intermittent or continuing use of MDMA or related drugs, including MDA, has occurred during this period, the definitional requirements for dependence have not been met.

**Exclusions:** Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)

Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

**6C4C.23** MDMA or related drug dependence, including MDA, sustained full remission  
After a diagnosis of MDMA or related drug dependence, including MDA, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from MDMA or related drugs, including MDA, for 12 months or longer.

**Exclusions:** Episode of harmful use of MDMA or related drugs, including MDA (6C4C.0)  
Harmful pattern of use of MDMA or related drugs, including MDA (6C4C.1)

**6C4C.2Z** MDMA or related drug dependence, including MDA, unspecified

**6C4C.3 MDMA or related drug intoxication, including MDA**

MDMA or related drug intoxication, including MDA is a clinically significant transient condition that develops during or shortly after the consumption of MDMA or related drugs that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of MDMA or related drugs and their intensity is closely related to the amount of MDMA or a related drug consumed. They are time-limited and abate as MDMA or a related drug is cleared from the body. Presenting features may include increased or inappropriate sexual interest and activity, anxiety, restlessness, agitation, and sweating. In rare instances, usually in severe intoxication, use of MDMA or related drugs, including MDA can result in dystonia and seizures. Sudden death is a rare but recognised complication.

**Coding Note:** Code also the causing condition

**6C4C.4 MDMA or related drug withdrawal, including MDA**

MDMA or related drug withdrawal, including MDA is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of MDMA or related drugs in individuals who have developed MDMA or related drug dependence or have used MDMA or related drugs for a prolonged period or in large amounts. Presenting features of MDMA or related drug withdrawal may include fatigue, lethargy, hypersomnia or insomnia, depressed mood, anxiety, irritability, craving, difficulty in concentrating, and appetite disturbance.

**Coding Note:** Code also the causing condition

**6C4C.5 MDMA or related drug-induced delirium, including MDA**

MDMA or related drug-induced delirium, including MDA is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of MDMA or related drugs. The amount and duration of MDMA or related drug use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**6C4C.6 MDMA or related drug-induced psychotic disorder, including MDA**

MDMA or related drug-induced psychotic disorder, including MDA is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with MDMA or related drugs. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of MDMA or related drug intoxication. The amount and duration of MDMA or related drug use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the MDMA or related drug use, if the symptoms persist for a substantial period of time after cessation of the MDMA or related drug use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with MDMA or related drug use, including MDA).

**Coding Note:** Code also the causing condition

**6C4C.7 Certain specified MDMA or related drug-induced mental or behavioural disorders, including MDA**

**Coding Note:** Code also the causing condition

**6C4C.70 MDMA or related drug-induced mood disorder, including MDA**

MDMA or related drug-induced mood disorder, including MDA is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with MDMA or related drugs. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of MDMA or related drug intoxication, including MDA. The amount and duration of MDMA or related drug use must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the MDMA or related drug use, if the symptoms persist for a substantial period of time after cessation of the MDMA or related drug use, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with MDMA or related drug use).

**Coding Note:** Code also the causing condition

**6C4C.71** MDMA or related drug-induced anxiety disorder

MDMA or related drug-induced anxiety disorder, including MDA is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with MDMA or related drugs. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of MDMA or related drug intoxication, including MDA. The amount and duration of MDMA or related drug use must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the MDMA or related drug use, if the symptoms persist for a substantial period of time after cessation of the MDMA or related drug use, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with MDMA or related drug use).

**Coding Note:** Code also the causing condition

**6C4C.Y** **Other specified disorders due to use of MDMA or related drugs, including MDA**

**6C4C.Z** **Disorders due to use of MDMA or related drugs, including MDA, unspecified**

**6C4D** **Disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP]**

Disorders due to use of dissociative drugs including ketamine and phencyclidine [PCP] are characterised by the pattern and consequences of dissociative drug use. Dissociative drugs include ketamine and phencyclidine (PCP) and their (comparatively rare) chemical analogues. Ketamine is an intravenous anaesthetic widely used in low- and middle-income countries, particularly in Africa, and in emergency situations. Ketamine is also undergoing evaluation for treatment of some mental disorders (e.g., treatment resistant Depressive Disorders). It is also a widespread drug of nonmedical use in many countries and may be taken by the oral or nasal routes or injected. It produces a sense of euphoria but depending on the dose, emergent hallucinations and dissociation are recognised as unpleasant side effects. Phencyclidine has a more restricted worldwide distribution and also has euphoric and dissociative effects. Its use may result in bizarre behaviour uncharacteristic for the individual, including self-harm. Dissociative Drug Dependence is described but a withdrawal syndrome is not recognized by most authorities. Several Dissociative Drug-Induced Mental Disorders are recognised.

**Exclusions:** Hazardous use of dissociative drugs including ketamine or PCP (QE11.7)

**6C4D.0****Episode of harmful use of dissociative drugs including ketamine or PCP**

An episode of use of a dissociative drug, including Ketamine and PCP, that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to intoxication with a dissociative drug, including Ketamine and PCP, on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of dissociative drugs, including Ketamine and PCP.

**Exclusions:** Dissociative drug dependence including ketamine or PCP (6C4D.2)  
Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

**6C4D.1****Harmful pattern of use of dissociative drugs, including ketamine or PCP**

A pattern of use of dissociative drugs, including ketamine and phencyclidine (PCP), that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of dissociative drug use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to dissociative drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of dissociative drugs, including ketamine and PCP applies.

**Exclusions:** Dissociative drug dependence including ketamine or PCP (6C4D.2)  
Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)

- 6C4D.10** Harmful pattern of use of dissociative drugs including ketamine or PCP, episodic  
 A pattern of episodic or intermittent use of dissociative drugs, including ketamine and phencyclidine (PCP), that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic use of dissociative drugs is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to dissociative drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of dissociative drugs, including ketamine and PCP applies.
- Exclusions:** Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)  
 Dissociative drug dependence including ketamine or PCP (6C4D.2)
- 6C4D.11** Harmful pattern of use of dissociative drugs including ketamine or PCP, continuous  
 A pattern of continuous (daily or almost daily) use of dissociative drugs, including ketamine and phencyclidine (PCP), that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous use of dissociative drugs is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to dissociative drug intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of dissociative drugs, including ketamine and PCP applies.
- Exclusions:** Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)  
 Dissociative drug dependence including ketamine or PCP (6C4D.2)
- 6C4D.1Z** Harmful pattern of use of dissociative drugs, including ketamine or PCP, unspecified

**6C4D.2                      Dissociative drug dependence including ketamine or PCP**

Dissociative drug dependence including ketamine or PCP is a disorder of regulation of dissociative drug use arising from repeated or continuous use of dissociative drugs. The characteristic feature is a strong internal drive to use dissociative drugs, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use dissociative drugs. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if dissociative drugs use is continuous (daily or almost daily) for at least 3 months.

**Exclusions:**                      Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)  
                                                 Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

**6C4D.20                      Dissociative drug dependence including Ketamine or PCP, current use**

Dissociative drug dependence including Ketamine and PCP, current use refers to use of dissociative drugs within the past month.

**Exclusions:**                      Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)  
                                                 Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

**6C4D.21                      Dissociative drug dependence including ketamine or PCP, early full remission**

After a diagnosis of Dissociative drug dependence including ketamine and PCP, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from dissociative drugs during a period lasting between 1 and 12 months.

**Exclusions:**                      Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)  
                                                 Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

**6C4D.22                      Dissociative drug dependence including Ketamine or PCP, sustained partial remission**

After a diagnosis of Dissociative drug dependence including Ketamine and PCP, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in dissociative drug consumption for more than 12 months, such that even though intermittent or continuing dissociative drug use has occurred during this period, the definitional requirements for dependence have not been met.

**Exclusions:**                      Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)  
                                                 Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

**6C4D.23** Dissociative drug dependence including Ketamine or PCP, sustained full remission  
After a diagnosis of Dissociative drug dependence including Ketamine and PCP, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from dissociative drugs for 12 months or longer.

**Exclusions:** Episode of harmful use of dissociative drugs including ketamine or PCP (6C4D.0)  
Harmful pattern of use of dissociative drugs, including ketamine or PCP (6C4D.1)

**6C4D.2Z** Dissociative drug dependence including ketamine or PCP, unspecified

**6C4D.3 Dissociative drug intoxication including Ketamine or PCP**

Dissociative drug intoxication including Ketamine and PCP is a clinically significant transient condition that develops during or shortly after the consumption of a dissociative drug that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of a dissociative drug and their intensity is closely related to the amount of the dissociative drug consumed. They are time-limited and abate as the dissociative drug is cleared from the body. Presenting features may include aggression, impulsiveness, unpredictability, anxiety, psychomotor agitation, impaired judgment, numbness or diminished responsiveness to pain, slurred speech, and dystonia. Physical signs include nystagmus (repetitive, uncontrolled eye movements), tachycardia, elevated blood pressure, numbness, ataxia, dysarthria, and muscle rigidity. In rare instances, use of dissociative drugs including Ketamine and PCP can result in seizures.

**Coding Note:** Code also the causing condition

**6C4D.4 Dissociative drug-induced delirium including ketamine or PCP**

Dissociative drug-induced delirium including Ketamine or PCP is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or during the use of dissociative drugs. The amount and duration of dissociative drug use must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

- 6C4D.5                    Dissociative drug-induced psychotic disorder including Ketamine or PCP**
- Dissociative drug-induced psychotic disorder including Ketamine or PCP is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with dissociative drugs. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of Dissociative drug intoxication. The amount and duration of Dissociative drug use must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the dissociative drug use, if the symptoms persist for a substantial period of time after cessation of the dissociative drug use, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with dissociative drug use).

Examples include khat, antidepressants, medications with anticholinergic properties (e.g., benztropine), and some antihistamines.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>6C4E.0</b>       | <p><b>Episode of harmful use of other specified psychoactive substance</b></p> <p>An episode of use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of single episode of harmful use of other specified psychoactive substance applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the specified psychoactive substance.</p> <p><b>Exclusions:</b></p> <ul style="list-style-type: none"> <li>Harmful pattern of use of other specified psychoactive substance (6C4E.1)</li> <li>Other specified psychoactive substance dependence (6C4E.2)</li> </ul> |

**6C4E.1****Harmful pattern of use of other specified psychoactive substance**

A pattern of use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.

**Exclusions:** Other specified psychoactive substance dependence (6C4E.2)  
Episode of harmful use of other specified psychoactive substance (6C4E.0)

**6C4E.10****Harmful pattern of use of other specified psychoactive substance, episodic**

A pattern of episodic or intermittent use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Abuse that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.

**Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)  
Other specified psychoactive substance dependence (6C4E.2)

- 6C4E.11** Harmful pattern of use of other specified psychoactive substance, continuous
- A pattern of continuous (daily or almost daily) use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)
- Other specified psychoactive substance dependence (6C4E.2)
- 6C4E.1Z** Harmful pattern of use of other specified psychoactive substance, unspecified
- 6C4E.2** **Other specified psychoactive substance dependence**
- Other specified psychoactive substance dependence is a disorder of regulation of use of a specified substance arising from repeated or continuous use of the specified substance. The characteristic feature is a strong internal drive to use the specified substance, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the specified substance. Physiological features of dependence may also be present, including tolerance to the effects of the specified substance, withdrawal symptoms following cessation or reduction in use of the specified substance, or repeated use of the specified substance or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the specified substance is continuous (daily or almost daily) for at least 3 months.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)
- Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.20** Other specified psychoactive substance dependence, current use
- Current Other specified psychoactive substance dependence, with use of the specified psychoactive substance within the past month.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)
- Harmful pattern of use of other specified psychoactive substance (6C4E.1)

- 6C4E.21** Other specified psychoactive substance dependence, early full remission  
After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from the specified substance during a period lasting between 1 and 12 months.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)  
Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.22** Other specified psychoactive substance dependence, sustained partial remission  
After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of the specified substance for more than 12 months, such that even though intermittent or continuing substance use has occurred during this period, the definitional requirements for dependence have not been met.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)  
Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.23** Other specified psychoactive substance dependence, sustained full remission  
After a diagnosis of Other specified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from the specified substance for 12 months or longer.
- Exclusions:** Episode of harmful use of other specified psychoactive substance (6C4E.0)  
Harmful pattern of use of other specified psychoactive substance (6C4E.1)
- 6C4E.2Z** Other specified psychoactive substance dependence, unspecified
- 6C4E.3** **Other specified psychoactive substance intoxication**  
Other specified psychoactive substance intoxication is a clinically significant transient condition that develops during or shortly after the consumption of a specified psychoactive substance or medication that is characterised by disturbances in level of consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of the specified psychoactive substance and their intensity is closely related to the amount of the specified psychoactive substance consumed. They are time-limited and abate as the specified substance is cleared from the body.
- Coding Note:** Code also the causing condition

**6C4E.4 Other specified psychoactive substance withdrawal**

Other specified psychoactive substance withdrawal is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of the specified substance in individuals who have developed dependence or have used the specified substance for a prolonged period or in large amounts. Other specified psychoactive substance withdrawal can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the specified substance.

**Coding Note:** Code also the causing condition

**6C4E.40 Other specified psychoactive substance withdrawal, uncomplicated**

The development of a withdrawal state not accompanied by perceptual disturbances or seizures following cessation or reduction of use of the specified substance.

**Coding Note:** Code also the causing condition

**6C4E.41 Other specified psychoactive substance withdrawal, with perceptual disturbances**

The development of a withdrawal state accompanied by perceptual disturbances but not by seizures following cessation or reduction of use of the specified substance.

**Coding Note:** Code also the causing condition

**6C4E.42 Other specified psychoactive substance withdrawal, with seizures**

The development of a withdrawal state accompanied by seizures but not by perceptual disturbances following cessation or reduction of use of the specified substance.

**Coding Note:** Code also the causing condition

**6C4E.43 Other specified psychoactive substance withdrawal, with perceptual disturbances and seizures**

The development of a withdrawal state accompanied by both perceptual disturbances and seizures following cessation or reduction of use of the specified substance.

**Coding Note:** Code also the causing condition

**6C4E.4Z Other specified psychoactive substance withdrawal, unspecified**

**Coding Note:** Code also the causing condition

**6C4E.5 Delirium induced by other specified psychoactive substance including medications**

Delirium induced by other specified psychoactive substance is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of a specified psychoactive substance. The amount and duration of use of the specified substance must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a different substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.

**Coding Note:** Code also the causing condition

**6C4E.6 Psychotic disorder induced by other specified psychoactive substance**

Psychotic disorder induced by other specified psychoactive substance is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

**Coding Note:** Code also the causing condition

**6C4E.7 Certain other specified psychoactive substance-induced mental or behavioural disorders**

**Coding Note:** Code also the causing condition

**6C4E.70****Mood disorder induced by other specified psychoactive substance**

Mood disorder induced by other specified psychoactive substance is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

**Coding Note:** Code also the causing condition

**6C4E.71****Anxiety disorder induced by other specified psychoactive substance**

Anxiety disorder induced by other specified psychoactive substance is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication with or withdrawal from a specified psychoactive substance. The amount and duration of use of the specified psychoactive substance must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the specified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the specified psychoactive substance or withdrawal from the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the specified psychoactive substance).

| <b>6C4E.73</b>      | <p>Impulse control disorder induced by other specified psychoactive substance</p> <p>Impulse control disorder induced by other specified psychoactive substance is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of intoxication with or withdrawal from the specified psychoactive substance. The amount and duration of the specified psychoactive substance use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the specified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the specified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with specified psychoactive substance use).</p> |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**6C4F****Disorders due to use of multiple specified psychoactive substances, including medications**

Disorders due to use of multiple specified psychoactive substances, including medications are characterised by the pattern and consequences of multiple psychoactive substances. Although this grouping is provided for coding purposes, in most clinical situations it is recommended that multiple specific disorders due to substance use be assigned rather than using categories from this grouping.

**6C4F.0****Episode of harmful use of multiple specified psychoactive substances**

An episode of use of multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorder Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of single episode of harmful use of multiple specified psychoactive substances applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the multiple psychoactive substances.

**Exclusions:** Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)  
Multiple specified psychoactive substances dependence (6C4F.2)

**6C4F.1****Harmful pattern of use of multiple specified psychoactive substances**

A pattern of use of multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of Harmful pattern of use of multiple specified psychoactive substances applies.

**Exclusions:** Episode of harmful use of multiple specified psychoactive substances (6C4F.0)  
Multiple specified psychoactive substances dependence (6C4F.2)

- 6C4F.10** Harmful pattern of use of multiple specified psychoactive substances, episodic  
 A pattern of episodic or intermittent use of a specified psychoactive substance or medication that is not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to intoxication due to the specified substance or medication on the part of the person to whom the diagnosis of Harmful pattern of use of other specified psychoactive substance applies.
- Exclusions:** Episode of harmful use of multiple specified psychoactive substances (6C4F.0)  
 Multiple specified psychoactive substances dependence (6C4F.2)
- 6C4F.11** Harmful pattern of use of multiple specified psychoactive substances, continuous  
 A pattern of continuous (daily or almost daily) use of multiple specified psychoactive substances or medications that are not included in the other substance classes specifically identified under Disorders Due to Substance Use that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to multiple substance intoxication or psychoactive medication use; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to multiple substance intoxication or psychoactive medication use on the part of the person to whom the diagnosis of Harmful pattern of multiple specified psychoactive substances applies.
- Exclusions:** Episode of harmful use of multiple specified psychoactive substances (6C4F.0)  
 Multiple specified psychoactive substances dependence (6C4F.2)
- 6C4F.12** Harmful pattern of use of multiple specified psychoactive substances, unspecified

| <b>6C4F.2</b>  | <p><b>Multiple specified psychoactive substances dependence</b></p> <p>Multiple specified psychoactive substance dependence is a disorder of regulation of use of multiple specified substances arising from repeated or continuous use of the specified substances. The characteristic feature is a strong internal drive to use the specified substances, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the specified substances. Physiological features of dependence may also be present, including tolerance to the effects of the specified substances, withdrawal symptoms following cessation or reduction in use of the specified substances, or repeated use of the specified substances or pharmacologically similar substances to prevent or alleviate withdrawal symptoms. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the specified substances is continuous (daily or almost daily) for at least 3 months.</p> <p><b>Exclusions:</b> Episode of harmful use of multiple specified psychoactive substances (6C4F.0)</p> <p>Harmful pattern of use of multiple specified psychoactive substances (6C4F.1)</p> |

|                     | Intoxication due to multiple specified psychoactive substances is a clinically significant transient condition that develops during or shortly after the consumption of multiple specified substances or medications that is characterised by disturbances in consciousness, cognition, perception, affect, behaviour, or coordination. These disturbances are caused by the known pharmacological effects of the multiple specified psychoactive substances and their intensity is closely related to the amount of the substances consumed. They are time-limited and abate as the multiple specified substances are cleared from the body.                                                                 |

|                     | Multiple specified psychoactive substance withdrawal is a clinically significant cluster of symptoms, behaviours and physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of multiple specified substances in individuals who have developed dependence or have used the specified substances for a prolonged period or in large amounts. Multiple specified psychoactive substance withdrawal can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the specified substances and their interactions. |

**6C4F.5 Delirium induced by multiple specified psychoactive substances including medications**

Delirium induced by multiple specified psychoactive substances is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of multiple specified substances. The amount and duration of use of the multiple specified substances must be capable of producing delirium. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from a substance other than those specified, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders. Note that this diagnosis applies only to those situations in which delirium is present but it cannot be determined which of multiple psychoactive substances is the cause of the delirium. In cases of multiple psychoactive substance use in which more than one specific substance can be identified as a cause of the delirium, the corresponding specific substance-induced delirium diagnoses should be given instead.

**Coding Note:** Code also the causing condition

**6C4F.6 Psychotic disorder induced by multiple specified psychoactive substances**

Psychotic disorder induced by multiple specified psychoactive substances is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of psychotic-like disturbances of perception, cognition, or behaviour that are characteristic of intoxication with or withdrawal from multiple specified psychoactive substances. The amount and duration of use of the multiple specified psychoactive substances must be capable of producing psychotic symptoms. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the use of the multiple specified psychoactive substances or withdrawal from the multiple specified psychoactive substances, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the multiple specified psychoactive substances).

**Coding Note:** Code also the causing condition

**6C4F.7 Certain multiple specified psychoactive substances-induced mental or behavioural disorders**

**Coding Note:** Code also the causing condition

**6C4F.70****Mood disorder induced by multiple specified psychoactive substances**

Mood disorder induced by multiple specified psychoactive substances is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of mood disturbances that are characteristic of intoxication with or withdrawal from multiple specified psychoactive substances. The amount and duration of use of the multiple specified psychoactive substances must be capable of producing mood symptoms. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the use of the multiple specified psychoactive substances or withdrawal from the multiple specified psychoactive substances, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the multiple specified psychoactive substances).

**Coding Note:** Code also the causing condition

**6C4F.71****Anxiety disorder induced by multiple specified psychoactive substances**

Anxiety disorder induced by multiple specified psychoactive substances is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of anxiety symptoms that are characteristic of intoxication with or withdrawal from multiple specified psychoactive substances. The amount and duration of use of the multiple specified psychoactive substances must be capable of producing anxiety symptoms. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the use of the multiple specified psychoactive substances or withdrawal from the multiple specified psychoactive substances, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the multiple specified psychoactive substances).

|                     | <p>Obsessive-compulsive or related disorder induced by multiple specified psychoactive substances is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of analogous disturbances that are characteristic of intoxication with or withdrawal from the multiple specified psychoactive substances. The amount and duration of the multiple specified psychoactive substances use must be capable of producing obsessive-compulsive or related symptoms. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the use of multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the multiple specified psychoactive substance use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with multiple specified psychoactive substances use).</p>                                                                                                                                                                                         |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>6C4F.73</b>      | <p>Impulse control syndrome induced by multiple specified psychoactive substances</p> <p>Impulse control disorder induced by multiple specified psychoactive substances is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from multiple specified psychoactive substances. The intensity or duration of the symptoms is substantially in excess of disturbances of impulse control that are characteristic of intoxication with or withdrawal from the multiple specified psychoactive substances. The amount and duration of the multiple specified psychoactive substances use must be capable of producing disturbances of impulse control. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the use of multiple specified psychoactive substances, if the symptoms persist for a substantial period of time after cessation of the multiple specified psychoactive substance use or withdrawal, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with multiple specified psychoactive substances use).</p> |

| <b>6C4F.Z</b>       | <b>Disorders due to use of multiple specified psychoactive substances, including medications, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**6C4G****Disorders due to use of unknown or unspecified psychoactive substances**

Disorders due to use of unknown or unspecified psychoactive substances are characterised by the pattern and consequences of psychoactive substance use when the specific substance is unknown or unspecified. These categories may be used in clinical situations in which it is clear that the disturbance is due to substance use but the specific class of substance is unknown. Once the relevant substance is identified, the disturbance should be recoded under the appropriate substance class.

**6C4G.0****Episode of harmful use of unknown or unspecified psychoactive substances**

An episode of use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication or withdrawal; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour due to substance intoxication or withdrawal on the part of the person to whom the diagnosis of single episode of harmful use applies. This diagnosis should not be made if the harm is attributed to a known pattern of use of the unknown or unspecified psychoactive substance.

**Exclusions:** Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)  
Unknown or unspecified psychoactive substance dependence (6C4G.2)

**6C4G.1****Harmful pattern of use of unknown or unspecified psychoactive substance**

A pattern of use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of substance use is evident over a period of at least 12 months if use is episodic or at least one month if use is continuous (i.e., daily or almost daily). Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.

**Exclusions:** Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  
Unknown or unspecified psychoactive substance dependence (6C4G.2)

**6C4G.10** Harmful pattern of use of unknown or unspecified psychoactive substance, episodic  
A pattern of episodic or intermittent use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of episodic substance use is evident over a period of at least 12 months. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.

**Exclusions:** Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  
Unknown or unspecified psychoactive substance dependence (6C4G.2)

**6C4G.11** Harmful pattern of use of unknown or unspecified psychoactive substance, continuous  
A pattern of continuous (daily or almost daily) use of an unknown or unspecified psychoactive substance that has caused damage to a person's physical or mental health or has resulted in behaviour leading to harm to the health of others. The pattern of continuous substance use is evident over a period of at least one month. Harm to health of the individual occurs due to one or more of the following: (1) behaviour related to intoxication; (2) direct or secondary toxic effects on body organs and systems; or (3) a harmful route of administration. Harm to health of others includes any form of physical harm, including trauma, or mental disorder that is directly attributable to behaviour related to substance intoxication on the part of the person to whom the diagnosis of Harmful pattern of use of unknown or unspecified psychoactive substance applies.

**Exclusions:** Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  
Unknown or unspecified psychoactive substance dependence (6C4G.2)

**6C4G.12** Harmful pattern of use of unknown or unspecified psychoactive substance, unspecified

**6C4G.2****Unknown or unspecified psychoactive substance dependence**

Unknown or unspecified psychoactive substance dependence is a disorder of regulation of use of an unknown or unspecified substance arising from repeated or continuous use of the substance. The characteristic feature is a strong internal drive to use the unknown or unspecified substance, which is manifested by impaired ability to control use, increasing priority given to use over other activities and persistence of use despite harm or negative consequences. These experiences are often accompanied by a subjective sensation of urge or craving to use the unknown or unspecified substance. The features of dependence are usually evident over a period of at least 12 months but the diagnosis may be made if use of the unknown or unspecified substance is continuous (daily or almost daily) for at least 3 months.

**Exclusions:**

Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

**6C4G.20**

Unknown or unspecified psychoactive substance dependence, current use

Current dependence on an unknown or unspecified psychoactive substance, with use of the substance within the past month.

**Exclusions:**

Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

**6C4G.21**

Unknown or unspecified psychoactive substance dependence, early full remission

After a diagnosis of Unknown or unspecified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), the individual has been abstinent from the substance during a period lasting between 1 and 12 months.

**Exclusions:**

Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

**6C4G.22**

Unknown or unspecified psychoactive substance dependence, sustained partial remission

After a diagnosis of Unknown or unspecified psychoactive substance dependence, and often following a treatment episode or other intervention (including self-help intervention), there is a significant reduction in consumption of the substance for more than 12 months, such that even though intermittent or continuing use of the substance has occurred during this period, the definitional requirements for dependence have not been met.

**Exclusions:**

Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)

Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)

- 6C4G.23** Unknown or unspecified psychoactive substance dependence, sustained full remission
- After a diagnosis of Unknown or unspecified psychoactive substance dependence, sustained full remission, and often following a treatment episode or other intervention (including self-intervention), the person has been abstinent from the substance for 12 months or longer.
- Exclusions:** Episode of harmful use of unknown or unspecified psychoactive substances (6C4G.0)  
Harmful pattern of use of unknown or unspecified psychoactive substance (6C4G.1)
- 6C4G.2Z** Unknown or unspecified psychoactive substance dependence, substance and state of remission unspecified
- 6C4G.3** **Intoxication due to unknown or unspecified psychoactive substance**
- Intoxication due to unknown or unspecified psychoactive substance is a transient condition that develops during or shortly after the administration of an unknown or unspecified psychoactive substance that is characterised by disturbances in level of consciousness, cognition, perception, affect or behaviour, or other psychophysiological functions and responses. This diagnosis should be made only when there is strong evidence that an unidentified substance has been taken and the features cannot be accounted for by another disorder or disease.
- Coding Note:** Code also the causing condition
- 6C4G.4** **Withdrawal due to unknown or unspecified psychoactive substance**
- Withdrawal due to unknown or unspecified psychoactive substance is a clinically significant cluster of symptoms, behaviours and/or physiological features, varying in degree of severity and duration, that occurs upon cessation or reduction of use of an unknown or unspecified substance in individuals who have developed dependence or have used the unknown or unspecified substance for a prolonged period or in large amounts. Withdrawal due to unknown or unspecified psychoactive substance can also occur when prescribed psychoactive medications have been used in standard therapeutic doses. The specific features of the withdrawal state depend on the pharmacological properties of the unknown or unspecified substance.
- Coding Note:** Code also the causing condition
- 6C4G.40** Withdrawal due to unknown or unspecified psychoactive substance, uncomplicated
- All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is not accompanied by perceptual disturbances or seizures.
- Coding Note:** Code also the causing condition

- 6C4G.41** Withdrawal due to unknown or unspecified psychoactive substance, with perceptual disturbances  
All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is accompanied by perceptual disturbances (e.g., visual or tactile hallucinations or illusions) with intact reality testing. There is no evidence of confusion and other diagnostic requirements for Delirium are not met. The withdrawal state is not accompanied by seizures.
- Coding Note:** Code also the causing condition
- 6C4G.42** Withdrawal due to unknown or unspecified psychoactive substance, with seizures  
All diagnostic requirements for Withdrawal due to unknown or unspecified psychoactive substance are met and the withdrawal state is accompanied by seizures (i.e., generalised tonic-clonic seizures) but not by perceptual disturbances.
- Coding Note:** Code also the causing condition
- 6C4G.43** Withdrawal due to unknown or unspecified psychoactive, with perceptual disturbances and seizures  
The development of a withdrawal syndrome accompanied by both perceptual disturbances and seizures following cessation or reduction of use of the unknown or unspecified substance.
- Coding Note:** Code also the causing condition
- 6C4G.4Z** Withdrawal due to unknown or unspecified psychoactive substance, unspecified
- Coding Note:** Code also the causing condition
- 6C4G.5** **Delirium induced by unknown or unspecified psychoactive substance**  
Delirium induced by unknown or unspecified psychoactive substance is characterised by an acute state of disturbed attention and awareness with specific features of delirium that develops during or soon after substance intoxication or withdrawal or during the use of an unknown or unspecified substance. The symptoms are not better explained by a primary mental disorder, by use of or withdrawal from another substance, or by another health condition that is not classified under Mental, behavioural and neurodevelopmental disorders.
- Coding Note:** Code also the causing condition

- 6C4G.6      Psychotic disorder induced by unknown or unspecified psychoactive substance**
- Psychotic disorder induced by unknown or unspecified psychoactive substance is characterised by psychotic symptoms (e.g., delusions, hallucinations, disorganised thinking, grossly disorganised behaviour) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., Schizophrenia, a Mood disorder with psychotic symptoms), as might be the case if the psychotic symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with psychotic symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).
- Coding Note:**      Code also the causing condition
- 6C4G.7      Certain unknown or unspecified psychoactive substance-induced mental or behavioural disorders**
- Coding Note:**      Code also the causing condition
- 6C4G.70      Mood disorder induced by unknown or unspecified psychoactive substance**
- Mood disorder induced by unknown or unspecified psychoactive substance is characterised by mood symptoms (e.g., depressed or elevated mood, decreased engagement in pleasurable activities, increased or decreased energy levels) that develop during or soon after intoxication with or withdrawal from a specified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., a Depressive disorder, a Bipolar disorder, Schizoaffective disorder), as might be the case if the mood symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with mood symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).
- Coding Note:**      Code also the causing condition

**6C4G.71** Anxiety disorder induced by unknown or unspecified psychoactive substance

Anxiety disorder induced by unknown or unspecified psychoactive substance is characterised by anxiety symptoms (e.g., apprehension or worry, fear, physiological symptoms of excessive autonomic arousal, avoidance behaviour) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., an Anxiety and fear-related disorder, a Depressive disorder with prominent anxiety symptoms), as might be the case if the anxiety symptoms preceded the onset of the use of the unknown or unspecified psychoactive substance, if the symptoms persist for a substantial period of time after cessation of the use of the unknown or unspecified psychoactive substance or withdrawal from the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with anxiety symptoms (e.g., a history of prior episodes not associated with the use of the unknown or unspecified psychoactive substance).

**Coding Note:** Code also the causing condition

**6C4G.72** Obsessive-compulsive or related disorder induced by unknown or unspecified psychoactive substance

Obsessive-compulsive or related disorder induced by unknown or unspecified psychoactive substance is characterised by either repetitive intrusive thoughts or preoccupations, normally associated with anxiety and typically accompanied by repetitive behaviours performed in response, or by recurrent and habitual actions directed at the integument (e.g., hair pulling, skin picking) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (in particular an Obsessive-compulsive or related disorder), as might be the case if the symptoms preceded the onset of the unknown or unspecified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with obsessive-compulsive or related symptoms (e.g., a history of prior episodes not associated with the unknown or unspecified psychoactive substance use).

**Coding Note:** Code also the causing condition

**6C4G.73** Impulse control disorder induced by unknown or unspecified psychoactive substance

Impulse control disorder induced by unknown or unspecified psychoactive substance is characterised by persistently repeated behaviours in which there is recurrent failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite longer-term harm either to the individual or to others (e.g., fire setting or stealing without apparent motive, repetitive sexual behaviour, aggressive outbursts) that develop during or soon after intoxication with or withdrawal from an unknown or unspecified psychoactive substance. The symptoms are not better explained by a primary mental disorder (e.g., an Impulse control disorder, a Disorder due to addictive behaviours), as might be the case if the impulse control disturbances preceded the onset of the unknown or unspecified psychoactive substance use, if the symptoms persist for a substantial period of time after cessation of use or withdrawal of the unknown or unspecified psychoactive substance, or if there is other evidence of a pre-existing primary mental disorder with impulse control symptoms (e.g., a history of prior episodes not associated with the unknown or unspecified psychoactive substance use).

**Coding Note:** Code also the causing condition

**6C4G.Y** **Other specified disorders due to use of unknown or unspecified psychoactive substances**

**6C4G.Z** **Disorders due to use of unknown or unspecified psychoactive substances, unspecified**

## **6C4H Disorders due to use of non-psychoactive substances**

Disorders due to use of non-psychoactive substances are characterised by the pattern and consequences of non-medical use of non-psychoactive substances. Non-psychoactive substances include laxatives, anabolic steroids, growth hormone, erythropoietin, and non-steroidal anti-inflammatory drugs. They may also include proprietary or over-the-counter medicines and folk remedies. Non-medical use of these substances may be associated with harm to the individual due to the direct or secondary toxic effects of the non-psychoactive substance on body organs and systems, or a harmful route of administration (e.g., infections due to intravenous self-administration). They are not associated with intoxication or with a dependence or withdrawal syndrome and are not recognized causes of substance-induced mental disorders.

**6C4H.0** **Episode of harmful use of non-psychoactive substances**

An episode of use of a non-psychoactive substance that has caused damage to a person's physical or mental health. Harm to health of the individual occurs due to direct or secondary toxic effects on body organs and systems or a harmful route of administration. This diagnosis should not be made if the harm is attributed to a known pattern of non-psychoactive substance use.

**Exclusions:** Harmful pattern of use of non-psychoactive substances (6C4H.1)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Disorders due to addictive behaviours (6C50-6C5Z)

Disorders due to addictive behaviours are recognizable and clinically significant syndromes associated with distress or interference with personal functions that develop as a result of repetitive rewarding behaviours other than the use of dependence-producing substances. Disorders due to addictive behaviours include gambling disorder and gaming disorder, which may involve both online and offline behaviour.

**Exclusions:** Compulsive sexual behaviour disorder (6C72)

Paraphilic disorders (6D30-6D3Z)

### 6C50

#### Gambling disorder

Gambling disorder is characterised by a pattern of persistent or recurrent gambling behaviour, which may be online (i.e., over the internet) or offline, manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The pattern of gambling behaviour results in significant distress or in significant impairment in personal, family, social, educational, occupational or other important areas of functioning. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

**Inclusions:** Compulsive gambling

**Exclusions:** Bipolar type I disorder (6A60)

Bipolar type II disorder (6A61)

Hazardous gambling or betting (QE21)

#### 6C50.0 Gambling disorder, predominantly offline

Gambling disorder, predominantly offline is characterised by a pattern of persistent or recurrent gambling behaviour that is not primarily conducted over the internet and is manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

**Exclusions:** Hazardous gambling or betting (QE21)

## **6C50.1                    Gambling disorder, predominantly online**

Gambling disorder, predominantly online is characterised by a pattern of persistent or recurrent gambling behaviour that is primarily conducted over the internet and is manifested by:

1. impaired control over gambling (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gambling to the extent that gambling takes precedence over other life interests and daily activities; and
3. continuation or escalation of gambling despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gambling behaviour may be continuous or episodic and recurrent. The gambling behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

**Exclusions:**                    Hazardous gambling or betting (QE21)

## **6C50.Z                    Gambling disorder, unspecified**

### **6C51**

## **Gaming disorder**

Gaming disorder is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming'), which may be online (i.e., over the internet) or offline, manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and
3. continuation or escalation of gaming despite the occurrence of negative consequences.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The pattern of gaming behaviour results in marked distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

**Exclusions:**                    Hazardous gaming (QE22)  
                                        Bipolar type I disorder (6A60)  
                                        Bipolar type II disorder (6A61)

## **6C51.0                    Gaming disorder, predominantly online**

Gaming disorder, predominantly online is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming') that is primarily conducted over the internet and is manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and

3. continuation or escalation of gaming despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

#### **6C51.1                    Gaming disorder, predominantly offline**

Gaming disorder, predominantly offline is characterised by a pattern of persistent or recurrent gaming behaviour ('digital gaming' or 'video-gaming') that is not primarily conducted over the internet and is manifested by:

1. impaired control over gaming (e.g., onset, frequency, intensity, duration, termination, context);
2. increasing priority given to gaming to the extent that gaming takes precedence over other life interests and daily activities; and
3. continuation or escalation of gaming despite the occurrence of negative consequences. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

The pattern of gaming behaviour may be continuous or episodic and recurrent. The gaming behaviour and other features are normally evident over a period of at least 12 months in order for a diagnosis to be assigned, although the required duration may be shortened if all diagnostic requirements are met and symptoms are severe.

#### **6C51.Z                    Gaming disorder, unspecified**

#### **6C5Y                    Other specified disorders due to addictive behaviours**

#### **6C5Z                    Disorders due to addictive behaviours, unspecified**

## Impulse control disorders (6C70-6C7Z)

Impulse control disorders are characterised by the repeated failure to resist an impulse, drive, or urge to perform an act that is rewarding to the person, at least in the short-term, despite consequences such as longer-term harm either to the individual or to others, marked distress about the behaviour pattern, or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Impulse Control Disorders involve a range of specific behaviours, including fire-setting, stealing, sexual behaviour, and explosive outbursts.

**Coded Elsewhere:** Substance-induced impulse control disorders

Gambling disorder (6C50)

Gaming disorder (6C51)

Secondary impulse control syndrome (6E66)

Body-focused repetitive behaviour disorders (6B25)

### 6C70

#### Pyromania

Pyromania is characterised by a recurrent failure to control strong impulses to set fires, resulting in multiple acts of, or attempts at, setting fire to property or other objects, in the absence of an apparent motive (e.g., monetary gain, revenge, sabotage, political statement, attracting attention or recognition). There is an increasing sense of tension or affective arousal prior to instances of fire setting, persistent fascination or preoccupation with fire and related stimuli (e.g., watching fires, building fires, fascination with firefighting equipment), and a sense of pleasure, excitement, relief or gratification during, and immediately after the act of setting the fire, witnessing its effects, or participating in its aftermath. The behaviour is not better explained by intellectual impairment, another mental and behavioural disorder, or substance intoxication.

**Inclusions:** pathological fire-setting

**Exclusions:** Conduct-dissocial disorder (6C91)

Bipolar type I disorder (6A60)

Schizophrenia or other primary psychotic disorders  
(6A20-6A2Z)

Fire-setting as the reason for observation for suspected mental  
or behavioural disorders, ruled out (QA02.3)

### 6C71

#### Kleptomania

Kleptomania is characterised by a recurrent failure to control strong impulses to steal objects in the absence of an apparent motive (e.g., objects are not acquired for personal use or monetary gain). There is an increasing sense of tension or affective arousal before instances of theft and a sense of pleasure, excitement, relief, or gratification during and immediately after the act of stealing. The behaviour is not better explained by intellectual impairment, another mental and behavioural disorder, or substance intoxication.

**Coding Note:** If stealing occurs within the context of conduct-dissocial disorder or a manic episode, Kleptomania should not be diagnosed separately.

**Inclusions:** pathological stealing

**Exclusions:** shoplifting as the reason for observation for suspected mental  
disorder, ruled out (QA02.3)

**6C72****Compulsive sexual behaviour disorder**

Compulsive sexual behaviour disorder is characterised by a persistent pattern of failure to control intense, repetitive sexual impulses or urges resulting in repetitive sexual behaviour. Symptoms may include repetitive sexual activities becoming a central focus of the person's life to the point of neglecting health and personal care or other interests, activities and responsibilities; numerous unsuccessful efforts to significantly reduce repetitive sexual behaviour; and continued repetitive sexual behaviour despite adverse consequences or deriving little or no satisfaction from it. The pattern of failure to control intense, sexual impulses or urges and resulting repetitive sexual behaviour is manifested over an extended period of time (e.g., 6 months or more), and causes marked distress or significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. Distress that is entirely related to moral judgments and disapproval about sexual impulses, urges, or behaviours is not sufficient to meet this requirement.

**Exclusions:** Paraphilic disorders (6D30-6D3Z)

**6C73****Intermittent explosive disorder**

Intermittent explosive disorder is characterised by repeated brief episodes of verbal or physical aggression or destruction of property that represent a failure to control aggressive impulses, with the intensity of the outburst or degree of aggressiveness being grossly out of proportion to the provocation or precipitating psychosocial stressors. The symptoms are not better explained by another mental, behavioural, or neurodevelopmental disorder and are not part of a pattern of chronic anger and irritability (e.g., in oppositional defiant disorder). The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

**Exclusions:** Oppositional defiant disorder (6C90)

**6C7Y****Other specified impulse control disorders****6C7Z****Impulse control disorders, unspecified**

## Disruptive behaviour or dissocial disorders (6C90-6C9Z)

Disruptive behaviour and dissocial disorders are characterised by persistent behaviour problems that range from markedly and persistently defiant, disobedient, provocative or spiteful (i.e., disruptive) behaviours to those that persistently violate the basic rights of others or major age-appropriate societal norms, rules, or laws (i.e., dissocial). Onset of Disruptive and dissocial disorders is commonly, though not always, during childhood.

### **6C90**

#### **Oppositional defiant disorder**

Oppositional defiant disorder is a persistent pattern (e.g., 6 months or more) of markedly defiant, disobedient, provocative or spiteful behaviour that occurs more frequently than is typically observed in individuals of comparable age and developmental level and that is not restricted to interaction with siblings. Oppositional defiant disorder may be manifest in prevailing, persistent angry or irritable mood, often accompanied by severe temper outbursts or in headstrong, argumentative and defiant behaviour. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning

### **6C90.0**

#### **Oppositional defiant disorder with chronic irritability-anger**

All definitional requirements for oppositional defiant disorder are met. This form of oppositional defiant disorder is characterised by prevailing, persistent angry or irritable mood that may be present independent of any apparent provocation. The negative mood is often accompanied by regularly occurring severe temper outbursts that are grossly out of proportion in intensity or duration to the provocation. Chronic irritability and anger are characteristic of the individual's functioning nearly every day, are observable across multiple settings or domains of functioning (e.g., home, school, social relationships), and are not restricted to the individual's relationship with his/her parents or guardians. The pattern of chronic irritability and anger is not limited to occasional episodes (e.g., developmentally typical irritability) or discrete periods (e.g., irritable mood in the context of manic or depressive episodes).

### **6C90.00**

Oppositional defiant disorder with chronic irritability-anger with limited prosocial emotions

All definitional requirements for oppositional defiant disorder with chronic irritability-anger are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental.

### **6C90.01**

Oppositional defiant disorder with chronic irritability-anger with typical prosocial emotions

All definitional requirements for oppositional defiant disorder with chronic irritability-anger are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.

### **6C90.0Z**

Oppositional defiant disorder with chronic irritability-anger, unspecified

- 6C90.1**      **Oppositional defiant disorder without chronic irritability-anger**  
 Meets all definitional requirements for oppositional defiant disorder. This form of oppositional defiant disorder is not characterised by prevailing, persistent, angry or irritable mood, but does feature headstrong, argumentative, and defiant behaviour.
- 6C90.10**      Oppositional defiant disorder without chronic irritability-anger with limited prosocial emotions  
 All definitional requirements for oppositional defiant disorder without chronic irritability-anger are met. In addition, the individual exhibits characteristics that are sometimes referred to as 'callous and unemotional'. These characteristics include a lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress; a lack of remorse, shame or guilt over their own behaviour (unless prompted by being apprehended), a relative indifference to the probability of punishment; a lack of concern over poor performance in school or work; and limited expression of emotions, particularly positive or loving feelings toward others, or only doing so in ways that seem shallow, insincere, or instrumental. This pattern is pervasive across situations and relationships (i.e., the qualifier should not be applied based on a single characteristic, a single relationship, or a single instance of behaviour) and is persistent over time (e.g., at least 1 year).
- 6C90.11**      Oppositional defiant disorder without chronic irritability-anger with typical prosocial emotions  
 All definitional requirements for oppositional defiant disorder without chronic irritability-anger are met. The individual does not exhibit characteristics referred to as 'callous and unemotional', such as lack of empathy or sensitivity to the feelings of others and a lack of concern for others' distress.
- 6C90.1Z**      Oppositional defiant disorder without chronic irritability-anger, unspecified
- 6C90.Z**      **Oppositional defiant disorder, unspecified**
- 6C91**      **Conduct-dissocial disorder**  
 Conduct-dissocial disorder is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. The behaviour pattern is of sufficient severity to result in significant impairment in personal, family, social, educational, occupational or other important areas of functioning. To be diagnosed, the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.
- 6C91.0**      **Conduct-dissocial disorder, childhood onset**  
 Conduct-dissocial disorder, childhood onset is characterised by a repetitive and persistent pattern of behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws are violated such as aggression towards people or animals; destruction of property; deceitfulness or theft; and serious violations of rules. To be diagnosed, features of the disorder must be present during childhood prior to adolescence (e.g., before 10 years of age) and the behaviour pattern must be enduring over a significant period of time (e.g., 12 months or more). Isolated dissocial or criminal acts are thus not in themselves grounds for the diagnosis.

## Personality disorders and related traits (6D10-6D11.5)

**Coded Elsewhere:** Secondary personality change (6E68)

## 6D10

**Personality disorder**

Personality disorder is characterised by problems in functioning of aspects of the self (e.g., identity, self-worth, accuracy of self-view, self-direction), and/or interpersonal dysfunction (e.g., ability to develop and maintain close and mutually satisfying relationships, ability to understand others' perspectives and to manage conflict in relationships) that have persisted over an extended period of time (e.g., 2 years or more). The disturbance is manifest in patterns of cognition, emotional experience, emotional expression, and behaviour that are maladaptive (e.g., inflexible or poorly regulated) and is manifest across a range of personal and social situations (i.e., is not limited to specific relationships or social roles). The patterns of behaviour characterizing the disturbance are not developmentally appropriate and cannot be explained primarily by social or cultural factors, including socio-political conflict. The disturbance is associated with substantial distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning.

## 6D10.0

**Mild personality disorder**

All general diagnostic requirements for Personality Disorder are met. Disturbances affect some areas of personality functioning but not others (e.g., problems with self-direction in the absence of problems with stability and coherence of identity or self-worth), and may not be apparent in some contexts. There are problems in many interpersonal relationships and/or in performance of expected occupational and social roles, but some relationships are maintained and/or some roles carried out. Specific manifestations of personality disturbances are generally of mild severity. Mild Personality Disorder is typically not associated with substantial harm to self or others, but may be associated with substantial distress or with impairment in personal, family, social, educational, occupational or other important areas of functioning that is either limited to circumscribed areas (e.g., romantic relationships; employment) or present in more areas but milder.

**6D10.1****Moderate personality disorder**

All general diagnostic requirements for Personality Disorder are met. Disturbances affect multiple areas of personality functioning (e.g., identity or sense of self, ability to form intimate relationships, ability to control impulses and modulate behaviour). However, some areas of personality functioning may be relatively less affected. There are marked problems in most interpersonal relationships and the performance of most expected social and occupational roles is compromised to some degree. Relationships are likely to be characterised by conflict, avoidance, withdrawal, or extreme dependency (e.g., few friendships maintained, persistent conflict in work relationships and consequent occupational problems, romantic relationships characterised by serious disruption or inappropriate submissiveness). Specific manifestations of personality disturbance are generally of moderate severity. Moderate Personality Disorder is sometimes associated with harm to self or others, and is associated with marked impairment in personal, family, social, educational, occupational or other important areas of functioning, although functioning in circumscribed areas may be maintained.

**6D10.2****Severe personality disorder**

All general diagnostic requirements for Personality Disorder are met. There are severe disturbances in functioning of the self (e.g., sense of self may be so unstable that individuals report not having a sense of who they are or so rigid that they refuse to participate in any but an extremely narrow range of situations; self view may be characterised by self-contempt or be grandiose or highly eccentric). Problems in interpersonal functioning seriously affect virtually all relationships and the ability and willingness to perform expected social and occupational roles is absent or severely compromised. Specific manifestations of personality disturbance are severe and affect most, if not all, areas of personality functioning. Severe Personality Disorder is often associated with harm to self or others, and is associated with severe impairment in all or nearly all areas of life, including personal, family, social, educational, occupational, and other important areas of functioning.

**6D10.Z****Personality disorder, severity unspecified****6D11****Prominent personality traits or patterns**

Trait domain qualifiers may be applied to Personality Disorders or Personality Difficulty to describe the characteristics of the individual's personality that are most prominent and that contribute to personality disturbance. Trait domains are continuous with normal personality characteristics in individuals who do not have Personality Disorder or Personality Difficulty. Trait domains are not diagnostic categories, but rather represent a set of dimensions that correspond to the underlying structure of personality. As many trait domain qualifiers may be applied as necessary to describe personality functioning. Individuals with more severe personality disturbance tend to have a greater number of prominent trait domains.

- 6D11.0      Negative affectivity in personality disorder or personality difficulty**
- The core feature of the Negative Affectivity trait domain is the tendency to experience a broad range of negative emotions. Common manifestations of Negative Affectivity, not all of which may be present in a given individual at a given time, include: experiencing a broad range of negative emotions with a frequency and intensity out of proportion to the situation; emotional lability and poor emotion regulation; negativistic attitudes; low self-esteem and self-confidence; and mistrustfulness.
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.
- 6D11.1      Detachment in personality disorder or personality difficulty**
- The core feature of the Detachment trait domain is the tendency to maintain interpersonal distance (social detachment) and emotional distance (emotional detachment). Common manifestations of Detachment, not all of which may be present in a given individual at a given time, include: social detachment (avoidance of social interactions, lack of friendships, and avoidance of intimacy); and emotional detachment (reserve, aloofness, and limited emotional expression and experience).
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.
- 6D11.2      Dissociality in personality disorder or personality difficulty**
- The core feature of the Dissociality trait domain is disregard for the rights and feelings of others, encompassing both self-centeredness and lack of empathy. Common manifestations of Dissociality, not all of which may be present in a given individual at a given time, include: self-centeredness (e.g., sense of entitlement, expectation of others' admiration, positive or negative attention-seeking behaviours, concern with one's own needs, desires and comfort and not those of others); and lack of empathy (i.e., indifference to whether one's actions inconvenience or hurt others, which may include being deceptive, manipulative, and exploitative of others, being mean and physically aggressive, callousness in response to others' suffering, and ruthlessness in obtaining one's goals).
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.
- 6D11.3      Disinhibition in personality disorder or personality difficulty**
- The core feature of the Disinhibition trait domain is the tendency to act rashly based on immediate external or internal stimuli (i.e., sensations, emotions, thoughts), without consideration of potential negative consequences. Common manifestations of Disinhibition, not all of which may be present in a given individual at a given time, include: impulsivity; distractibility; irresponsibility; recklessness; and lack of planning.
- Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

**6D11.4 Anankastia in personality disorder or personality difficulty**

The core feature of the Anankastia trait domain is a narrow focus on one's rigid standard of perfection and of right and wrong, and on controlling one's own and others' behaviour and controlling situations to ensure conformity to these standards. Common manifestations of Anankastia, not all of which may be present in a given individual at a given time, include: perfectionism (e.g., concern with social rules, obligations, and norms of right and wrong, scrupulous attention to detail, rigid, systematic, day-to-day routines, hyper-scheduling and planfulness, emphasis on organisation, orderliness, and neatness); and emotional and behavioural constraint (e.g., rigid control over emotional expression, stubbornness and inflexibility, risk-avoidance, perseveration, and deliberativeness).

**Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

**6D11.5 Borderline pattern**

The Borderline pattern specifier may be applied to individuals whose pattern of personality disturbance is characterised by a pervasive pattern of instability of interpersonal relationships, self-image, and affects, and marked impulsivity, as indicated by many of the following: Frantic efforts to avoid real or imagined abandonment; A pattern of unstable and intense interpersonal relationships; Identity disturbance, manifested in markedly and persistently unstable self-image or sense of self; A tendency to act rashly in states of high negative affect, leading to potentially self-damaging behaviours; Recurrent episodes of self-harm; Emotional instability due to marked reactivity of mood; Chronic feelings of emptiness; Inappropriate intense anger or difficulty controlling anger; Transient dissociative symptoms or psychotic-like features in situations of high affective arousal.

**Coding Note:** This category should ONLY be used in combination with a Personality disorder category (Mild, Moderate, or Severe) or Personality difficulty.

**Paraphilic disorders (6D30-6D3Z)**

Paraphilic disorders are characterised by persistent and intense patterns of atypical sexual arousal, manifested by sexual thoughts, fantasies, urges, or behaviours, the focus of which involves others whose age or status renders them unwilling or unable to consent and on which the person has acted or by which he or she is markedly distressed. Paraphilic disorders may include arousal patterns involving solitary behaviours or consenting individuals only when these are associated with marked distress that is not simply a result of rejection or feared rejection of the arousal pattern by others or with significant risk of injury or death.

**Inclusions:** paraphilias

**6D30****Exhibitionistic disorder**

Exhibitionistic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves exposing one's genitals to an unsuspecting individual in public places, usually without inviting or intending closer contact. In addition, in order for Exhibitionistic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Exhibitionistic Disorder specifically excludes consensual exhibitionistic behaviours that occur with the consent of the person or persons involved as well as socially sanctioned forms of exhibitionism.

**6D31**

### **Voyeuristic disorder**

Voyeuristic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves observing an unsuspecting individual who is naked, in the process of disrobing, or engaging in sexual activity. In addition, in order for Voyeuristic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Voyeuristic Disorder specifically excludes consensual voyeuristic behaviours that occur with the consent of the person or persons being observed.

**6D32**

### **Pedophilic disorder**

Pedophilic disorder is characterised by a sustained, focused, and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—involving pre-pubertal children. In addition, in order for Pedophilic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. This diagnosis does not apply to sexual behaviours among pre- or post-pubertal children with peers who are close in age.

**6D33**

### **Coercive sexual sadism disorder**

Coercive sexual sadism disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges or behaviours—that involves the infliction of physical or psychological suffering on a non-consenting person. In addition, in order for Coercive Sexual Sadism Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Coercive Sexual Sadism Disorder specifically excludes consensual sexual sadism and masochism.

**6D34**

### **Frotteuristic disorder**

Frotteuristic disorder is characterised by a sustained, focused and intense pattern of sexual arousal—as manifested by persistent sexual thoughts, fantasies, urges, or behaviours—that involves touching or rubbing against a non-consenting person in crowded public places. In addition, in order for Frotteuristic Disorder to be diagnosed, the individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. Frotteuristic Disorder specifically excludes consensual touching or rubbing that occurs with the consent of the person or persons involved.

**6D35**

### **Other paraphilic disorder involving non-consenting individuals**

Other paraphilic disorder involving non-consenting individuals is characterised by a persistent and intense pattern of atypical sexual arousal — manifested by sexual thoughts, fantasies, urges, or behaviours — in which the focus of the arousal pattern involves others who are unwilling or unable to consent but that is not specifically described in any of the other named Paraphilic Disorders categories (e.g., arousal patterns involving corpses or animals). The individual must have acted on these thoughts, fantasies or urges or be markedly distressed by them. The disorder specifically excludes sexual behaviours that occur with the consent of the person or persons involved, provided that they are considered able to provide such consent.

**6D36****Paraphilic disorder involving solitary behaviour or consenting individuals**

Paraphilic disorder involving solitary behaviour or consenting individuals is characterised by a persistent and intense pattern of atypical sexual arousal — manifested by sexual thoughts, fantasies, urges, or behaviours — that involves consenting adults or solitary behaviours. One of the following two elements must be present: 1) the person is markedly distressed by the nature of the arousal pattern and the distress is not simply a consequence of rejection or feared rejection of the arousal pattern by others; or 2) the nature of the paraphilic behaviour involves significant risk of injury or death either to the individual or to the partner (e.g., asphyxophilia).

**6D3Z****Paraphilic disorders, unspecified****Factitious disorders (6D50-6D5Z)**

Factitious disorders are characterised by intentionally feigning, falsifying, inducing, or aggravating medical, psychological, or behavioural signs and symptoms or injury in oneself or in another person, most commonly a child dependent, associated with identified deception. A pre-existing disorder or disease may be present, but the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. Individuals with factitious disorder seek treatment or otherwise present themselves or another person as ill, injured, or impaired based on the feigned, falsified, or self-induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or evading criminal prosecution). This is in contrast to Malingering, in which obvious external rewards or incentives motivate the behaviour.

**Exclusions:**

Malingering (QC30)

**6D50****Factitious disorder imposed on self**

Factitious disorder imposed on self is characterised by feigning, falsifying, or inducing medical, psychological, or behavioural signs and symptoms or injury associated with identified deception. If a pre-existing disorder or disease is present, the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. The individual seeks treatment or otherwise presents himself or herself as ill, injured, or impaired based on the feigned, falsified, or self-induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or evading criminal prosecution). This is in contrast to Malingering, in which obvious external rewards or incentives motivate the behaviour

**Inclusions:** Münchhausen syndrome

**Exclusions:** Excoriation disorder (6B25.1)  
Malingering (QC30)

**6D51****Factitious disorder imposed on another**

Factitious disorder imposed on another is characterised by feigning, falsifying, or inducing medical, psychological, or behavioural signs and symptoms or injury in another person, most commonly a child dependent, associated with identified deception. If a pre-existing disorder or disease is present in the other person, the individual intentionally aggravates existing symptoms or falsifies or induces additional symptoms. The individual seeks treatment for the other person or otherwise presents him or her as ill, injured, or impaired based on the feigned, falsified, or induced signs, symptoms, or injuries. The deceptive behaviour is not solely motivated by obvious external rewards or incentives (e.g., obtaining disability payments or avoiding criminal prosecution for child or elder abuse).

**Coding Note:** The diagnosis of Factitious Disorder Imposed on Another is assigned to the individual who is feigning, falsifying or inducing the symptoms in another person, not to the person who is presented as having the symptoms. Occasionally the individual induces or falsifies symptoms in a pet rather than in another person.

**Exclusions:** Malingering (QC30)

**6D5Z****Factitious disorders, unspecified****Neurocognitive disorders (6D70-6E0Z)**

Neurocognitive disorders are characterised by primary clinical deficits in cognitive functioning that are acquired rather than developmental. That is, neurocognitive disorders do not include disorders characterised by deficits in cognitive function that are present from birth or that typically arise during the developmental period, which are classified in the grouping neurodevelopmental disorders. Rather, neurocognitive disorders represent a decline from a previously attained level of functioning. Although cognitive deficits are present in many mental disorders (e.g., schizophrenia, bipolar disorders), only disorders whose core features are cognitive are included in the neurocognitive disorders grouping. In cases where the underlying pathology and aetiology for neurocognitive disorders can be determined, the identified etiology should be classified separately.

**Exclusions:** Neurodevelopmental disorders (6A00-6A0Z)

**Coded Elsewhere:** Secondary neurocognitive syndrome (6E67)

**6D70****Delirium**

Delirium is characterized by a disturbance of attention, orientation, and awareness that develops within a short period of time, typically presenting as significant confusion or global neurocognitive impairment, with transient symptoms that may fluctuate depending on the underlying causal condition or etiology. Delirium often includes disturbance of behaviour and emotion, and may include impairment in multiple cognitive domains. A disturbance of the sleep-wake cycle, including reduced arousal of acute onset or total sleep loss with reversal of the sleep-wake cycle, may also be present. Delirium may be caused by the direct physiological effects of a medical condition not classified under mental, behavioural or neurodevelopmental disorders, by the direct physiological effects of a substance or medication, including withdrawal, or by multiple or unknown etiological factors.

**6D71****Mild neurocognitive disorder**

Mild neurocognitive disorder is characterized by mild impairment in one or more cognitive domains relative to that expected given the individual's age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning. Diagnosis is based on report from the patient, informant, or clinical observation, and is accompanied by objective evidence of impairment by quantified clinical assessment or standardized cognitive testing. Cognitive impairment is not severe enough to significantly interfere with an individual's ability to perform activities related to personal, family, social, educational, and/or occupational functioning or other important functional areas. Cognitive impairment is not attributable to normal aging and may be static, progressive, or may resolve or improve depending on underlying cause or treatment. Cognitive impairment may be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

**Coding Note:** Code also the causing condition

**6D72****Amnestic disorder**

Amnestic disorder is characterised by prominent memory impairment relative to expectations for age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning, in the absence of other significant cognitive impairment. It is manifested by a deficit in acquiring, learning, and/or retaining new information, and may include the inability to recall previously learned information, without disturbance of consciousness, altered mental status, or delirium. Recent memory is typically more disturbed than remote memory, and the ability to immediately recall a limited amount of information is usually relatively preserved. The memory impairment is severe enough to result in significant impairment in personal, family, social, educational, occupational, or other important areas of functioning. It is presumed to be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, to use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

**Exclusions:**

- Delirium (6D70)
- Dementia (6D80-6D8Z)
- Mild neurocognitive disorder (6D71)

**6D72.0 Amnestic disorder due to diseases classified elsewhere**

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct pathophysiological consequence of a medical condition not classified under mental, behavioural and neurodevelopmental disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not better explained by Delirium, Dementia, another mental disorder (e.g., Schizophrenia or Other Primary Psychotic Disorder, a Mood Disorder) or the effects of a medication or substance, including withdrawal effects. The symptoms are sufficiently severe to be a specific focus of clinical attention. The identified etiological medical condition should be classified separately.

**Coding Note:** Code also the causing condition

**Exclusions:** amnesia: retrograde (MB21.11)  
Korsakoff syndrome, alcohol-induced or unspecified (8D44)  
Dissociative amnesia (6B61)  
Anterograde amnesia (MB21.10)  
amnesia NOS (MB21.1)

**6D72.1 Amnestic disorder due to psychoactive substances including medications**

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of psychoactive substance use. The intensity and duration of substance use must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after substance intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of substance use.

**Coding Note:** Code also the causing condition

**6D72.10 Amnestic disorder due to use of alcohol**

All definitional requirements for amnestic disorder are met. The memory symptoms are judged to be the direct consequence of alcohol use. The intensity and duration of alcohol use must be known to be capable of producing memory impairment. The memory impairment may develop during or soon after alcohol intoxication or withdrawal, but its intensity and duration are substantially in excess of those normally associated with these conditions. The symptoms are not better accounted for by another disorder or medical condition, as might be the case if the amnestic symptoms preceded the onset of the alcohol use.

**Coding Note:** This category should not be used to describe cognitive changes due to thiamine deficiency associated with chronic alcohol use.

**Exclusions:** Korsakoff syndrome (5B5A.11)  
Wernicke-Korsakoff Syndrome (5B5A.1)

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Dementia (6D80-6D8Z)

Dementia is characterized by the presence of marked impairment in two or more cognitive domains relative to that expected given the individual's age and general premorbid level of cognitive functioning, which represents a decline from the individual's previous level of functioning. Memory impairment is present in most forms of dementia, but cognitive impairment is not restricted to memory (i.e., there is impairment in other areas such as executive functions, attention, language, social cognition and judgment, psychomotor speed, visuoperceptual or visuospatial abilities). Neurobehavioural changes may also be present and, in some forms of dementia, may be the presenting symptom. Cognitive impairment is not attributable to normal aging and is severe enough to significantly interfere with independence in an individual's performance of activities of daily living. The cognitive impairment is presumed to be attributable to an underlying acquired disease of the nervous system, a trauma, an infection or other disease process affecting the brain, or to use of specific substances or medications, nutritional deficiency or exposure to toxins, or the etiology may be undetermined. The impairment is not due to current substance intoxication or withdrawal.

**Coding Note:** This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.

When dementia is due to multiple aetiologies, code all that apply.

#### Dementia due to Alzheimer disease

Dementia due to Alzheimer disease is the most common form of dementia. Onset is insidious with memory impairment typically reported as the initial presenting complaint. The characteristic course is a slow but steady decline from a previous level of cognitive functioning with impairment in additional cognitive domains (such as executive functions, attention, language, social cognition and judgment, psychomotor speed, visuoperceptual or visuospatial abilities) emerging with disease progression. Dementia due to Alzheimer disease may be accompanied by mental and behavioural symptoms such as depressed mood and apathy in the initial stages of the disease and may be accompanied by psychotic symptoms, irritability, aggression, confusion, abnormalities of gait and mobility, and seizures at later stages. Positive genetic testing, family history and gradual cognitive decline are suggestive of Dementia due to Alzheimer disease.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

**6D81****Dementia due to cerebrovascular disease**

Dementia due to brain parenchyma injury resulting from cerebrovascular disease (ischemic or haemorrhagic). The onset of the cognitive deficits is temporally related to one or more vascular events. Cognitive decline is typically most prominent in speed of information processing, complex attention, and frontal-executive functioning. There is evidence of the presence of cerebrovascular disease considered to be sufficient to account for the neurocognitive deficits from history, physical examination and neuroimaging.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

**Exclusions:** Alzheimer disease dementia, mixed type, with cerebrovascular disease (6D80.2)

**6D82****Dementia due to Lewy body disease**

Dementia preceding or occurring within one year after the onset of motor parkinsonian signs in the setting of Lewy body disease. Characterized by presence of Lewy bodies, which are intraneuronal inclusions containing  $\alpha$ -synuclein and ubiquitin in the brain stem, limbic area, forebrain, and neocortex. Onset is insidious with attentional and executive functioning deficits often present. These cognitive deficits are often accompanied by visual hallucinations and symptoms of REM sleep behaviour disorder. Hallucinations in other sensory modalities, depressive symptoms, and delusions may also be present. The symptom presentation usually varies significantly over the course of days necessitating longitudinal assessment and differentiation from delirium. Spontaneous onset of Parkinsonism within approximately 1 year of the onset of cognitive symptoms is common.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D83****Frontotemporal dementia**

Frontotemporal dementia (FTD) is a group of primary neurodegenerative disorders primarily affecting the frontal and temporal lobes. Onset is typically insidious with a gradual and worsening course. Several syndromic variants (some with an identified genetic basis or familiarity) are described that include presentations with predominantly marked personality and behavioral changes (such as executive dysfunction, apathy, deterioration of social cognition, repetitive behaviours, and dietary changes), predominantly language deficits (that include semantic, agrammatic/nonfluent, and logopenic forms), predominantly movement-related deficits (progressive supranuclear palsy, corticobasal degeneration, multiple systems atrophy, or amyotrophic lateral sclerosis), or a combination of these deficits. Memory function often remains relatively intact, particularly during the early stages of the disorder.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D84****Dementia due to psychoactive substances including medications**

Dementia due to psychoactive substances including medications includes forms of dementia that are judged to be a direct consequence of substance use and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of substance use must be sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by substances such as a dementia due to another medical condition.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**Exclusions:** Dementia due to exposure to heavy metals and other toxins (6D85.2)

**6D84.0****Dementia due to use of alcohol**

Dementia due to use of alcohol is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of alcohol use and that persist beyond the usual duration of alcohol intoxication or acute withdrawal. The intensity and duration of alcohol use must have been sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder or disease that is not induced by alcohol such as a dementia due to another disorder or disease classified elsewhere.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

This category should not be used to describe cognitive changes due to thiamine deficiency associated with chronic alcohol use.

**Inclusions:** Alcohol-induced dementia

**Exclusions:** Wernicke-Korsakoff Syndrome (5B5A.1)

Korsakoff syndrome (5B5A.11)

**6D84.1      Dementia due to use of sedatives, hypnotics or anxiolytics**

Dementia due to use of sedatives, hypnotics or anxiolytics is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of sedative, hypnotic, or anxiolytic use and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of sedative, hypnotic, or anxiolytic use must be sufficient to produce the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by sedatives, hypnotics, or anxiolytics such as a dementia due to another medical condition.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**Inclusions:** Late-onset psychoactive substance-induced psychotic disorder

**6D84.2      Dementia due to use of volatile inhalants**

Dementia due to use of volatile inhalants is characterised by the development of persistent cognitive impairments (e.g., memory problems, language impairment, and an inability to perform complex motor tasks) that meet the definitional requirements of Dementia that are judged to be a direct consequence of inhalant use or exposure and that persist beyond the usual duration of action or withdrawal syndrome associated with the substance. The amount and duration of inhalant use or exposure must be sufficient to be capable of producing the cognitive impairment. The cognitive impairment is not better accounted for by a disorder that is not induced by volatile inhalants such as a dementia due to another medical condition.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D84.Y      Dementia due to other specified psychoactive substance**

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85      Dementia due to diseases classified elsewhere**

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.0      Dementia due to Parkinson disease**

Dementia due to Parkinson disease develops among individuals with idiopathic Parkinson disease and is characterized by impairment in attention, memory, executive and visuo-spatial functions. Mental and behavioral symptoms such as changes in affect, apathy and hallucinations may also be present. Onset is insidious and the course is one of gradual worsening of symptoms.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.1      Dementia due to Huntington disease**

Dementia due to Huntington disease occurs as part of a widespread degeneration of the brain due to a trinucleotide repeat expansion in the HTT gene, which is transmitted through autosomal dominance. Onset of symptoms is insidious typically in the third and fourth decade of life with gradual and slow progression. Initial symptoms typically include impairments in executive functions with relative sparing of memory, prior to the onset of motor deficits (bradykinesia and chorea) characteristic of Huntington disease.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**Inclusions:**                      Dementia in Huntington chorea

**6D85.2      Dementia due to exposure to heavy metals and other toxins**

Dementia due to exposure to heavy metals and other toxins caused by toxic exposure to specific heavy metals such as aluminium from dialysis water, lead, mercury or manganese. The characteristic cognitive impairments in Dementia due to exposure to heavy metals and other toxins depend on the specific heavy metal or toxin that the individual has been exposed to but can affect any cognitive domain. Onset of symptoms is related to exposure and progression can be rapid especially with acute exposure. In many cases, symptoms are reversible when exposure is identified and ceases. Investigations such as brain imaging or neurophysiological testing may be abnormal. Lead poisoning is associated with abnormalities on brain imaging including widespread calcification and increased signal on MRI T2-weighted images of periventricular white matter, basal ganglia hypothalamus and pons. Dementia due to aluminium toxicity may demonstrate characteristic paroxysmal high-voltage delta EEG changes. Examination may make evident other features such as peripheral neuropathy in the case of lead, arsenic, or mercury.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**Exclusions:**                      Dementia due to psychoactive substances including medications (6D84)

**6D85.3                    Dementia due to human immunodeficiency virus**

Dementia due to human immunodeficiency virus develops during the course of confirmed HIV disease, in the absence of a concurrent illness or condition other than HIV infection that could explain the clinical features. Although a variety of patterns of cognitive deficit are possible depending on where the HIV pathogenic processes have occurred, typically deficits follow a subcortical pattern with impairments in executive function, processing speed, attention, and learning new information. The course of Dementia due to human immunodeficiency virus varies including resolution of symptoms, gradual decline in functioning, improvement, or fluctuation in symptoms. Rapid decline in cognitive functioning is rare with the advent of antiretroviral medications.

**Coding Note:**    This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.4                    Dementia due to multiple sclerosis**

Dementia due to multiple sclerosis is a neurodegenerative disease due to the cerebral effects of multiple sclerosis, a demyelinating disease. Onset of symptoms is insidious and not secondary to the functional impairment attributable to the primary disease (i.e., multiple sclerosis). Cognitive impairments vary according to the location of demyelination but typically include deficits in processing speed, memory, attention, and aspects of executive functioning.

**Coding Note:**    This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.5                    Dementia due to prion disease**

Dementia due to prion disease is a primary neurodegenerative disease caused by a group of spongiform encephalopathies resulting from abnormal prion protein accumulation in the brain. These can be sporadic, genetic (caused by mutations in the prion-protein gene), or transmissible (acquired from an infected individual). Onset is insidious and there is a rapid progression of symptoms and impairment characterised by cognitive deficits, ataxia, and motor symptoms (myoclonus, chorea, or dystonia). Diagnosis is typically made on the basis of brain imaging studies, presence of characteristic proteins in spinal fluid, EEG, or genetic testing.

**Coding Note:**    This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.6                    Dementia due to normal pressure hydrocephalus**

Dementia due to normal pressure hydrocephalus results from excess accumulation of cerebrospinal fluid in the brain as a result of idiopathic, non-obstructive causes but can also be secondary to haemorrhage, infection or inflammation. Progression is gradual but intervention (e.g., shunt) may result in improvement of symptoms, especially if administered earlier in the course of the condition. Typically, cognitive impairments include reduced processing speed and deficits in executive functioning and attention. These symptoms are also typically accompanied by gait abnormalities and urinary incontinence. Brain imaging to reveal ventricular volume and characterize brain displacement is often necessary to confirm the diagnosis.

**Coding Note:**    This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.7                    Dementia due to injury to the head**

Dementia due to injury to the head is caused by damage inflicted on the tissues of the brain as the direct or indirect result of an external force. Trauma to the brain is known to have resulted in loss of consciousness, amnesia, disorientation and confusion, or neurological signs. The symptoms characteristic of Dementia due to injury to the head must arise immediately following the trauma or after the individual gains consciousness and must persist beyond the acute post-injury period. Cognitive deficits vary depending on the specific brain areas affected and the severity of the injury but can include impairments in attention, memory, executive functioning, personality, processing speed, social cognition, and language abilities.

**Coding Note:**    This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.8                    Dementia due to pellagra**

Dementia due to pellagra is caused by persistent lack of vitamin B3 (niacin) or tryptophan either in the diet or due to poor absorption in the gastrointestinal tract due to disease (e.g., Crohn disease) or due to the effects of some medications (e.g., isoniazid). Core signs of pellagra include dermatological changes (sensitivity to sunlight, lesions, alopecia, and oedema) and diarrhoea. With prolonged nutritional deficiency cognitive symptoms that include aggressivity, motor disturbances (ataxia and restlessness), confusion, and weakness are observed. Treatment with nutritional supplementation (e.g., niacin) typically results in reversal of symptoms.

**Coding Note:**    Code also the causing condition

**6D85.9 Dementia due to Down syndrome**

Dementia due to Down syndrome is a neurodegenerative disorder related to the impact of abnormal increased production and accumulation of amyloid precursor protein (APP) leading to formation of beta-amyloid plaques and tau tangles. APP gene expression is increased due to its location on chromosome 21, which is abnormally triplicated in Down syndrome. Cognitive deficits and neuropathological features are similar to those observed in Alzheimer disease. Onset is typically after the fourth decade of life with a gradual decline in functioning, and may impact 50% or more of individuals with Down syndrome.

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D85.Y Dementia due to other specified diseases classified elsewhere**

**Coding Note:** This category should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of dementia in diseases classified elsewhere.

When dementia is due to multiple aetiologies, code all that apply.

**6D86**

**Behavioural or psychological disturbances in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant behavioural or psychological disturbances.

**Coding Note:** These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.

Code all that apply.

**Exclusions:** Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z)

**6D86.0 Psychotic symptoms in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant delusions or hallucinations.

**Exclusions:** Schizophrenia or other primary psychotic disorders (6A20-6A2Z)

Secondary psychotic syndrome (6E61)

**6D86.1 Mood symptoms in dementia**

In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant mood symptoms such as depressed mood, elevated mood, or irritable mood.

**Exclusions:** Mood disorders (6A60-6A8Z)

Secondary mood syndrome (6E62)

- 6D86.2      Anxiety symptoms in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant symptoms of anxiety or worry.
- Exclusions:**            Anxiety or fear-related disorders (6B00-6B0Z)  
                                 Secondary anxiety syndrome (6E63)
- 6D86.3      Apathy in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant indifference or lack of interest.
- Exclusions:**            Mood disorders (6A60-6A8Z)  
                                 Secondary mood syndrome (6E62)
- 6D86.4      Agitation or aggression in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes: 1) clinically significant excessive psychomotor activity accompanied by increased tension; or 2) hostile or violent behaviour.
- 6D86.5      Disinhibition in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant lack of restraint manifested in disregard for social conventions, impulsivity, and poor risk assessment.
- 6D86.6      Wandering in dementia**  
In addition to the cognitive disturbances characteristic of dementia, the current clinical picture includes clinically significant wandering that puts the person at risk of harm.
- 6D86.Y      Other specified behavioural or psychological disturbances in dementia**  
**Coding Note:**    These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.  
Code all that apply.
- 6D86.Z      Behavioural or psychological disturbances in dementia, unspecified**  
**Coding Note:**    These categories should never be used in primary tabulation. The codes are provided for use as supplementary or additional codes when it is desired to identify the presence of behavioural or psychological disturbance in dementia.  
Code all that apply.
- 6D8Y      Dementia, other specified cause**  
**Coding Note:**    This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.  
When dementia is due to multiple aetiologies, code all that apply.

**6D8Z****Dementia, unknown or unspecified cause**

**Coding Note:** This category should only be used for primary tabulation, if the aetiology of the dementia is unknown. If the aetiology of the dementia is known code to the aetiology of the dementia for primary tabulation.

When dementia is due to multiple aetiologies, code all that apply.

**6E0Y****Other specified neurocognitive disorders****6E0Z****Neurocognitive disorders, unspecified****Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)**

Syndromes associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involve significant mental and behavioural features. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned.

**Coded Elsewhere:** Psychological disorder related to obstetric fistula (GC04.1Y)

**6E20****Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, without psychotic symptoms**

A syndrome associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involves significant mental and behavioural features, most commonly depressive symptoms. The syndrome does not include delusions, hallucinations, or other psychotic symptoms. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned. This designation should not be used to describe mild and transient depressive symptoms that do not meet the diagnostic requirements for a depressive episode, which may occur soon after delivery (so-called postpartum blues).

**Coding Note:** Code also the causing condition

**6E21****Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, with psychotic symptoms**

A syndrome associated with pregnancy or the puerperium (commencing within about 6 weeks after delivery) that involves significant mental and behavioural features, including delusions, hallucinations, or other psychotic symptoms. Mood symptoms (depressive and/or manic) are also typically present. If the symptoms meet the diagnostic requirements for a specific mental disorder, that diagnosis should also be assigned.

**Coding Note:** Code also the causing condition

**6E2Z****Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium, unspecified**

**6E40****Psychological or behavioural factors affecting disorders or diseases classified elsewhere**

Psychological and behavioural factors affecting disorders or diseases classified elsewhere are those that may adversely affect the manifestation, treatment, or course of a condition classified in another chapter of the ICD. These factors may adversely affect the manifestation, treatment, or course of the disorder or disease classified in another chapter by: interfering with the treatment of the disorder or disease by affecting treatment adherence or care seeking; constituting an additional health risk; or influencing the underlying pathophysiology to precipitate or exacerbate symptoms or otherwise necessitate medical attention. This diagnosis should be assigned only when the factors increase the risk of suffering, disability, or death and represent a focus of clinical attention, and should be assigned together with the diagnosis for the relevant other condition.

**Inclusions:** Psychological factors affecting physical conditions

**Exclusions:** Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)

**6E40.0****Mental disorder affecting disorders or diseases classified elsewhere**

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual is diagnosed with a mental, behavioural, or neurodevelopmental disorder that adversely affects the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., a woman with Bulimia Nervosa and Type 1 diabetes mellitus who skips insulin doses as a way to avoid weight gain that would otherwise be caused by her binge eating).

**6E40.1****Psychological symptoms affecting disorders or diseases classified elsewhere**

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits psychological symptoms that do not meet the diagnostic requirements for a mental, behavioural, or neurodevelopmental disorder that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., depressive symptoms interfering with rehabilitation following surgery).

**6E40.2****Personality traits or coping style affecting disorders or diseases classified elsewhere**

All diagnostic requirements for Psychological or behavioural factors affecting disorders or diseases classified elsewhere are met. The individual exhibits personality traits or coping styles that do not meet the diagnostic requirements for a mental, behavioural, or neurodevelopmental disorder that adversely affect the manifestation, treatment, or course of a disorder or disease classified in another chapter (e.g., pathological denial of the need for surgery in a patient with cancer; hostile, pressured behaviour contributing to heart disease).

|               |                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Secondary mental or behavioural syndromes associated with disorders or diseases classified elsewhere (6E60-6E6Z)

This grouping includes syndromes characterised by the presence of prominent psychological or behavioural symptoms judged to be direct pathophysiological consequences of a medical condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., adjustment disorder or anxiety symptoms in response to being diagnosed with a life-threatening illness). These categories should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychological and behavioural symptoms are sufficiently severe to warrant specific clinical attention.

**Exclusions:** Acute pain (MG31)  
Bodily distress disorder (6C20)  
Chronic pain (MG30)

**Coded Elsewhere:** Delirium due to disease classified elsewhere (6D70.0)

### 6E60

#### Secondary neurodevelopmental syndrome

A syndrome that involves significant neurodevelopmental features that do not fulfill the diagnostic requirements of any of the specific neurodevelopmental disorders that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders (e.g., autistic-like features in Rett syndrome; aggression and self-mutilation in Lesch-Nyhan syndrome, abnormalities in language development in Williams syndrome), based on evidence from the history, physical examination, or laboratory findings.

This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the neurodevelopmental problems are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Autism spectrum disorder (6A02)  
Disorders of intellectual development (6A00)  
Stereotyped movement disorder (6A06)

### 6E60.0

#### Secondary speech or language syndrome

A syndrome that involves significant features related to speech or language development that do not fulfill the diagnostic requirements of any of the specific developmental speech or language disorders that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Possible etiologies include a disease of the nervous system, sensory impairment, brain injury or infection.

**Coding Note:** This diagnosis should be assigned in addition to the diagnosis for the presumed underlying disorder or disease when the neurodevelopmental problems are sufficiently severe to warrant specific clinical attention.

### 6E60.Y

#### Other specified secondary neurodevelopmental syndrome

**Coding Note:** Code also the causing condition

**6E60.Z      Secondary neurodevelopmental syndrome, unspecified**

**Coding Note:**      Code also the causing condition

**6E61      Secondary psychotic syndrome**

A syndrome characterised by the presence of prominent hallucinations or delusions judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**      Code also the causing condition

**Exclusions:**      Acute and transient psychotic disorder (6A23)  
                         Delirium (6D70)  
                         Mood disorders (6A60-6A8Z)

**6E61.0      Secondary psychotic syndrome, with hallucinations**

A syndrome characterised by the presence of prominent hallucinations that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Delusions are not a prominent aspect of the clinical presentation. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:**      Code also the causing condition

**Exclusions:**      Delirium (6D70)  
                         Mood disorders (6A60-6A8Z)

**6E61.1      Secondary psychotic syndrome, with delusions**

A syndrome characterised by the presence of prominent delusions that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. Hallucinations are not a prominent aspect of the clinical presentation. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:**            Delirium (6D70)  
                                 Mood disorders (6A60-6A8Z)

**6E61.2      Secondary psychotic syndrome, with hallucinations and delusions**

A syndrome characterised by the presence of both prominent hallucinations and prominent delusions that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the psychotic symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:**            Delirium (6D70)  
                                 Mood disorders (6A60-6A8Z)

**6E61.3      Secondary psychotic syndrome, with unspecified symptoms**

**Coding Note:** Code also the causing condition

**6E62      Secondary mood syndrome**

A syndrome characterised by the presence of prominent mood symptoms (i.e., depression, elevated mood, irritability) judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:**            Adjustment disorder (6B43)  
                                 Delirium (6D70)

**6E62.0****Secondary mood syndrome, with depressive symptoms**

A syndrome characterised by the presence of prominent depressive symptoms such as persistently depressed mood, loss of interest in previously enjoyable activities, or signs such as tearful and downtrodden appearance that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Adjustment disorder (6B43)  
Delirium (6D70)

**6E62.1****Secondary mood syndrome, with manic symptoms**

A syndrome characterised by the presence of prominent manic symptoms such as elevated, euphoric, irritable, or expansive mood states, rapid changes among different mood states (i.e., mood lability), or increased energy or activity that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings.

**Coding Note:** Code also the causing condition

**Inclusions:** mood syndrome due to disorders or diseases not classified under Mental and behavioural disorders, with manic symptoms

**Exclusions:** Adjustment disorder (6B43)  
Delirium (6D70)

**6E62.2****Secondary mood syndrome, with mixed symptoms**

A syndrome characterised by the presence of both manic and depressive symptoms, either occurring together or alternating from day to day or over the course of a day that is judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders based on evidence from the history, physical examination, or laboratory findings. Manic symptoms may include elevated, euphoric, irritable, or expansive mood states, rapid changes among different mood states (i.e., mood lability), or increased energy or activity. Depressive symptoms may include persistently depressed mood, loss of interest in previously enjoyable activities, or signs such as tearful or downtrodden appearance. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., depressive symptoms in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the mood symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Adjustment disorder (6B43)  
Delirium (6D70)

**6E62.3****Secondary mood syndrome, with unspecified symptoms**

**Coding Note:** Code also the causing condition

**Exclusions:** Adjustment disorder (6B43)  
Delirium (6D70)

**6E63****Secondary anxiety syndrome**

A syndrome characterised by the presence of prominent anxiety symptoms judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., anxiety symptoms or panic attacks in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the anxiety symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Adjustment disorder (6B43)  
Delirium (6D70)

**6E64****Secondary obsessive-compulsive or related syndrome**

A syndrome characterised by the presence of prominent obsessions, compulsions, hoarding, skin picking, hair pulling, other body-focused repetitive behaviours, or other symptoms characteristic of obsessive-compulsive and related disorder that is judged to be the direct pathophysiological consequence of a disorder or disease not classified under Mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by Delirium or by another Mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., repetitive ruminations in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the obsessive-compulsive or related symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Delirium (6D70)  
Obsessive-compulsive or related disorder induced by other  
specified psychoactive substance (6C4E.72)  
Tic disorders (8A05)

**6E65****Secondary dissociative syndrome**

A syndrome characterised by the presence of prominent dissociative symptoms (e.g., depersonalization, derealization) that is judged to be the direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., as part of an acute stress reaction in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the dissociative symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Delirium (6D70)  
Acute stress reaction (QE84)

**6E66****Secondary impulse control syndrome**

A syndrome characterised by the presence of prominent symptoms that are characteristic of Impulse Control Disorders or Disorders Due to Addictive Behaviours (e.g., stealing, fire-setting, aggressive outbursts, compulsive sexual behaviour, excessive gambling) that are judged to be a direct pathophysiological consequence of a health condition not classified under mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., as part of an adjustment disorder in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the impulse control symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Delirium (6D70)

**6E67****Secondary neurocognitive syndrome**

A syndrome that involves significant cognitive features that do not fulfill the diagnostic requirements of any of the specific neurocognitive disorders and are judged to be a direct pathophysiological consequence of a health condition or injury not classified under mental and behavioural disorders (e.g., cognitive changes due to a brain tumour), based on evidence from the history, physical examination, or laboratory findings. This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the cognitive symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Disorders with neurocognitive impairment as a major feature (8A20-8A2Z)

**Coded Elsewhere:** Delirium (6D70)

**6E68****Secondary personality change**

A syndrome characterised by a persistent personality disturbance that represents a change from the individual's previous characteristic personality pattern that is judged to be a direct pathophysiological consequence of a health condition not classified under Mental and behavioural disorders, based on evidence from the history, physical examination, or laboratory findings. The symptoms are not accounted for by delirium or by another mental and behavioural disorder, and are not a psychologically mediated response to a severe medical condition (e.g., social withdrawal, avoidance, or dependence in response to a life-threatening diagnosis). This category should be used in addition to the diagnosis for the presumed underlying disorder or disease when the personality symptoms are sufficiently severe to warrant specific clinical attention.

**Coding Note:** Code also the causing condition

**Exclusions:** Personality difficulty (QE50.7)  
Personality disorder (6D10)  
Delirium (6D70)

**6E69****Secondary catatonia syndrome**

Secondary catatonia syndrome is a syndrome of primarily psychomotor disturbances, characterized by the co-occurrence of several symptoms of decreased, increased, or abnormal psychomotor activity, which occurs as a direct pathophysiological consequence of a medical condition not classified under Mental, Behavioural or Neurodevelopmental Disorders. Examples of medical conditions that may be associated with Catatonia include diabetic ketoacidosis, hypercalcaemia, hepatic encephalopathy, homocystinuria, neoplasms head trauma, cerebrovascular disease, and encephalitis.

**Coding Note:** Use additional code, if desired, for any underlying disorder if known.

**6E6Y****Other specified secondary mental or behavioural syndrome**

**Coding Note:** Code also the causing condition

**6E6Z****Secondary mental or behavioural syndrome, unspecified**

**Coding Note:** Code also the causing condition

**6E8Y****Other specified mental, behavioural or neurodevelopmental disorders****6E8Z****Mental, behavioural or neurodevelopmental disorders, unspecified**

## CHAPTER 07

---

### Sleep-wake disorders

This chapter has 42 four-character categories.

Code range starts with 7A00

Sleep-wake disorders are characterised by difficulty initiating or maintaining sleep (insomnia disorders), excessive sleepiness (hypersomnolence disorders), respiratory disturbance during sleep (sleep-related breathing disorders), disorders of the sleep-wake schedule (circadian rhythm sleep-wake disorders), abnormal movements during sleep (sleep-related movement disorders), or problematic behavioural or physiological events that occur while falling asleep, during sleep, or upon arousal from sleep (parasomnia disorders).

This chapter contains the following top level blocks:

- Insomnia disorders
- Hypersomnolence disorders
- Sleep-related breathing disorders
- Circadian rhythm sleep-wake disorders
- Sleep-related movement disorders
- Parasomnia disorders

## Insomnia disorders (7A00-7A0Z)

Insomnia disorders are characterised by the complaint of persistent difficulty with sleep initiation, duration, consolidation, or quality that occurs despite adequate opportunity and circumstances for sleep, and results in some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder.

### **7A00**

#### **Chronic insomnia**

Chronic insomnia is a frequent and persistent difficulty initiating or maintaining sleep that occurs despite adequate opportunity and circumstances for sleep and that results in general sleep dissatisfaction and some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. The sleep disturbance and associated daytime symptoms occur at least several times per week for at least 3 months. Some individuals with chronic insomnia may show a more episodic course, with recurrent episodes of sleep/wake difficulties lasting several weeks at a time over several years. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder. If the insomnia is due to another sleep-wake disorder, a mental disorder, another medical condition, or a substance or medication, chronic insomnia should only be diagnosed if the insomnia is an independent focus of clinical attention.

### **7A01**

#### **Short-term insomnia**

Short-term insomnia is characterised by difficulty initiating or maintaining sleep of less than 3 months duration that occurs despite adequate opportunity and circumstances for sleep and results in general sleep dissatisfaction and some form of daytime impairment. Daytime symptoms typically include fatigue, depressed mood or irritability, general malaise, and cognitive impairment. Individuals who report sleep related symptoms in the absence of daytime impairment are not regarded as having an insomnia disorder. If the insomnia is due to another sleep-wake disorder, a mental disorder, another medical condition, or a substance or medication, short-term insomnia should only be diagnosed if the insomnia is an independent focus of clinical attention.

### **7A0Z**

#### **Insomnia disorders, unspecified**

## Hypersomnolence disorders (7A20-7A2Z)

Hypersomnolence disorders are characterised by a complaint of daytime sleepiness that is not due to another sleep-wake disorder (e.g. disturbed nocturnal sleep, misaligned circadian rhythm, or breathing disorder). Individuals with excessive sleepiness may show irritability, concentration and attention deficits, reduced vigilance, distractibility, reduced motivation, anergia, dysphoria, fatigue, restlessness, and lack of coordination.

### **7A20**

#### **Narcolepsy**

Narcolepsy is a disorder characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep occurring for at least several months, accompanied by abnormal manifestations of REM sleep. Multiple sleep latency testing (MSLT) demonstrates a mean sleep latency of <8 minutes and two or more sleep-onset REM periods (SOREMP's), or one or more SOREMP's on MSLT and a SOREMP on the preceding overnight polysomnography (PSG). Nighttime sleep is often disturbed, and brief daytime naps are typically refreshing.

### **7A20.0**

#### **Narcolepsy, Type 1**

Type 1 narcolepsy is a disorder of excessive sleepiness due to a deficiency of hypothalamic hypocretin (orexin) signaling. In addition to daily periods of irrepressible need to sleep or daytime lapses into sleep, type 1 narcolepsy is characterised by symptoms of REM sleep dissociation, most importantly cataplexy. Cataplexy is a sudden and uncontrollable loss of muscle tone arising during wakefulness that is typically triggered by a strong emotion, such as excitement or laughter. Although cataplexy is a pathognomonic symptom of type 1 narcolepsy, it may not manifest until years following onset of the sleepiness. In such cases, a diagnosis of narcolepsy, type 1 may be made based on cerebrospinal fluid (CSF)-hypocretin levels < 110 picograms per milliliter. Episodes of sleep paralysis and hypnagogic or hypnopompic hallucinations may also be present. The disorder is not attributable to a disease of the nervous system or other medical condition.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep plus either: a) cataplexy and multiple sleep latency test/polysomnography (MSLT/PSG) findings characteristic of narcolepsy; or b) demonstrated CSF hypocretin deficiency.

### **7A20.1**

#### **Narcolepsy, Type 2**

Type 2 narcolepsy is a disorder of excessive sleepiness characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep and abnormal manifestations of REM sleep as demonstrated by multiple sleep latency test (MSLT/PSG) findings in the context of normal hypothalamic hypocretin (orexin) signaling. That is, cerebrospinal fluid (CSF) hypocretin determinations are > 110 picograms per milliliter. Cataplexy is not present. The disorder is not attributable to a disease of the nervous system or other medical condition.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep and multiple sleep latency test/polysomnography (MSLT/PSG) findings characteristic of narcolepsy. There should be no evidence of cataplexy or CSF hypocretin deficiency (if testing is performed).

### **7A20.Z**

#### **Narcolepsy, unspecified**

**7A21****Idiopathic hypersomnia**

Idiopathic hypersomnia is characterised by daily periods of irrepressible need to sleep or daytime lapses into sleep occurring for at least several months in the absence of cataplexy or hypocretin deficiency (if determined). Polysomnography/multiple sleep latency test (MSLT) findings characteristic of narcolepsy (i.e., two or more sleep-onset REM periods (SOREMP's), or one or more SOREMP's on MSLT and a SOREMP on the preceding overnight polysomnography) should also be absent. The daytime sleepiness is not better explained by another disorder (e.g., insufficient sleep syndrome, obstructive sleep apnoea, circadian rhythm sleep-wake disorder), a substance or medication, or a medical condition). Objective evidence of hypersomnolence is indicated by an MSLT showing a mean sleep latency of  $\leq 8$  minutes or by polysomnography or wrist actigraphy showing a total 24-hour sleep time of 11 hours or more. Prolonged and severe sleep inertia is often observed and consists of sustained difficulty waking up with repeated returns to sleep, irritability, automatic behaviour, and confusion. In contrast to narcolepsy, naps are generally long, often more than 60 minutes, and unrefreshing.

Note: A definitive diagnosis requires daily periods of irrepressible need to sleep or daytime lapses into sleep, objective demonstration of excessive sleepiness and absence of REM-related findings by multiple sleep latency test (MSLT/PSG).

**7A22****Kleine-Levin syndrome**

Kleine-Levin syndrome is characterised by recurrent episodes of severe sleepiness in association with cognitive, psychiatric, and behavioural disturbances. A typical episode lasts a median of 10 days (range 2.5–80 days), with rare episodes lasting several weeks to months. During episodes, patients may sleep as long as 16 to 20 hours per day, waking or getting up only to eat and void. When awake during episodes, most patients are exhausted, apathetic, confused, and slow in speaking and answering. Hyperphagia, hypersexuality, childish behaviour, depression, anxiety, hallucinations and delusions are often observed during the episodes. Patients are normal between episodes with regard to sleep, cognition, mood, and eating. Rarely, Kleine Levin syndrome may occur exclusively during menstrual periods.

**Inclusions:** recurrent hypersomnolence

**7A23****Hypersomnia due to a medical condition**

Hypersomnia due to a medical condition is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping of at least several months duration that is attributable to a coexisting medical or neurological disorder (e.g. head trauma, Parkinson disease, certain genetic conditions, metabolic, neurologic or endocrine disorders) and is sufficiently severe to require an independent focus of clinical attention. Hypersomnia due to a medical condition is only diagnosed if the hypersomnia is a direct physiological consequence of the medical condition. Residual sleepiness in patients with adequately-treated obstructive sleep apnoea is classified here under the assumption that it is due to central nervous system damage from recurrent hypoxemia.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

**7A24**

### **Hypersomnia due to a medication or substance**

Hypersomnia due to a medication or substance is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping that is attributable to the sedating effects of medications, alcohol, or other psychoactive substances, including withdrawal syndromes (e.g., from stimulants) and is sufficiently severe to constitute an independent focus of clinical attention.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

**Inclusions:** Hypersomnia due to substances including medications

**7A25**

### **Hypersomnia associated with a mental disorder**

Hypersomnia associated with a mental disorder is characterised by excessive nocturnal sleep, daytime sleepiness, or excessive napping that is sufficiently severe to constitute an independent focus of clinical attention. This is most typical of depressive disorders or the depressed phase of bipolar disorders. Patients often feel that their sleep is of poor quality and nonrestorative and may be intensely focused on their hypersomnolence. Objective evidence of excessive sleepiness on MSLT is often absent.

Note: A definitive diagnosis requires use of polysomnography and multiple sleep latency test (MSLT) to rule out other hypersomnolence disorders or other sleep disorders (e.g. obstructive sleep apnea) which might better explain the sleepiness.

**7A26**

### **Insufficient sleep syndrome**

Insufficient sleep syndrome occurs when an individual persistently fails to obtain the amount of sleep required relative to their own physiological sleep requirements to maintain normal levels of alertness and wakefulness and is thus chronically sleep deprived. The curtailed sleep pattern is present most days for at least several months.

The person's ability to initiate and maintain sleep is unimpaired. Sleep time is often markedly extended on weekend nights or during holidays compared to weekday. Extension of total sleep time results in resolution of the symptoms of sleepiness.

**Inclusions:** Behaviourally induced hypersomnia

**Exclusions:** Narcolepsy (7A20)

**7A2Y**

### **Other specified hypersomnolence disorders**

**7A2Z**

### **Hypersomnolence disorders, unspecified**

## Sleep-related breathing disorders (7A40-7A4Z)

Sleep related breathing disorders are characterised by abnormalities of respiration during sleep. In some of these disorders, respiration is also abnormal during wakefulness. The disorders are grouped into central sleep apnoeas, obstructive sleep apnoea, and sleep related hypoventilation or hypoxemia disorders.

**Exclusions:** Apnoea of newborn (KB2A)

**Coded Elsewhere:** Sleep related Cheyne-Stokes respiration (MD11.4)

### 7A40

#### Central sleep apnoeas

Central sleep apnoeas are characterised by reduction or cessation of airflow due to absent or reduced respiratory effort. Central apnoea (cessation of airflow) or hypopnea (reduction in airflow) may occur in a cyclical or intermittent fashion. Patients with central sleep apnoea of various etiologies may also exhibit obstructive events, in which case diagnoses of both central sleep apnoea and obstructive sleep apnoea may be given.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**Exclusions:** Central neonatal apnoea (KB2A.0)

### 7A40.0

#### Primary central sleep apnoea

Primary central sleep apnoea is of unknown etiology (idiopathic) and is characterised by recurrent, predominantly central apnoeas. Airflow and respiratory effort cease simultaneously in a repetitive fashion over the course of the night. The recurrent episodes of apnoea (more than five per hour) and associated arousals are sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**Exclusions:** Primary central sleep apnoea of infancy (7A40.1)

Primary central sleep apnoea of prematurity (7A40.2)

### 7A40.1

#### Primary central sleep apnoea of infancy

Primary central sleep apnoea of infancy is characterised by prolonged (> 20 seconds), predominantly central apnoeas or periodic breathing during more than 5% of total sleep time in an infant of at least 37 weeks conceptional age. These events are typically associated with physiological compromise (hypoxemia, bradycardia), or the need for intervention such as stimulation or resuscitation. This diagnosis should be assigned when central events are the predominant finding, even if obstructive or mixed apnoeas or hypopneae are also present.

Note: A definitive diagnosis requires objective evidence based on polysomnography or alternative monitoring such as hospital or home monitoring.

**Exclusions:** Primary central sleep apnoea of prematurity (7A40.2)

**7A40.2****Primary central sleep apnoea of prematurity**

Primary central sleep apnoea of prematurity is characterised by prolonged (> 20 seconds), predominantly central apnoeas or periodic breathing during more than 5% of total sleep time in an infant of less than 37 weeks conceptional age. These events are typically associated with physiological compromise (hypoxemia, bradycardia), or the need for intervention such as stimulation or resuscitation. This diagnosis should be assigned when central events are the predominant finding, even if obstructive or mixed apnoeas or hypopneae are also present.

Note: A definitive diagnosis requires objective evidence based on polysomnography or alternative monitoring such as hospital or home monitoring.

**Exclusions:** Primary central sleep apnoea of infancy (7A40.1)

**7A40.3****Central sleep apnea with Cheyne-Stokes breathing**

Central sleep apnoea with Cheyne-Stokes breathing is characterised by recurrent, predominantly central apnoeas or central hypopneae (more than five per hour) alternating with a respiratory phase exhibiting a crescendo-decrescendo pattern of flow (or tidal volume). The longer cycle length (> 40 seconds) distinguishes central sleep apnoea with Cheyne-Stokes breathing from other central sleep apnoea types. The vast majority of patients with Central sleep apnoea with Cheyne-Stokes breathing have either systolic or diastolic heart failure. Patients with Central sleep apnoea with Cheyne-Stokes breathing have normal or low daytime arterial partial pressure of carbon dioxide (PaCO<sub>2</sub>). The disturbance is typically associated with atrial fibrillation/flutter, congestive heart failure, or a neurological disorder and is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**7A40.4****Central sleep apnoea due to a medical condition without Cheyne-Stokes breathing**

Central sleep apnoea due to a medical condition without Cheyne-Stokes breathing (CSB) is characterised by recurrent, predominantly central apnoeas or central hypopneae (more than five per hour) that are attributed to a medical condition (and do not have the pattern of CSB). The majority of these patients have brainstem lesions of developmental, vascular, neoplastic, degenerative, demyelinating, or traumatic origin. The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnea, or snoring.

Note: A definitive diagnosis requires objective evidence based on polysomnography in the presence of a medical condition that is judged to be causing the symptoms.

**Exclusions:** Central sleep apnoea due to a medication or substance (7A40.6)

- 7A40.5 Central sleep apnoea due to high-altitude periodic breathing**
- High-altitude periodic breathing is characterised by alternating periods of central apnoea and hyperpnoea associated with recent ascent to high altitude (typically > 2500 meters). The pattern of periodic breathing is an expected response to ascent to elevation. The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring. The cycle length of this respiratory pattern is commonly less than 40 seconds and often as short as 12 to 20 seconds.
- Note: This diagnosis can be made clinically based on symptoms and recent ascent to high altitude.
- 7A40.6 Central sleep apnoea due to a medication or substance**
- Central sleep apnoea due to a medication is characterised by a pattern of recurring, predominantly central sleep apnoea or hypopnoea (more than five per hour) that is attributable to a medication or substance, most commonly long-acting opioids (e.g. methadone, long-acting morphine or oxycodone, fentanyl patches). The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnoea, or snoring. Obstructive apnoeas and hypoventilation may be present, but central sleep apnoea is the predominant finding.
- Note: A definitive diagnosis requires objective evidence based on polysomnography in the context of medication or substance use that is judged to be causing the symptoms.
- 7A40.7 Treatment-emergent central sleep apnoea**
- Treatment-emergent central sleep apnoea is characterised by persistence or emergence of recurrent, predominantly central sleep apnoea (more than five per hour) during effective treatment for obstructive apnoea (obstructive or mixed apnoea or hypopnea) with positive airway pressure. Central apnoeas must be the predominant finding (>50% of total respiratory events). The disturbance is sufficiently severe to cause symptoms such as daytime sleepiness, disturbed sleep, awakening with dyspnea, or snoring. If the reduction or cessation of airflow due to absent or reduced respiratory effort is better explained by another central sleep apnoea disorder (e.g., Central sleep apnoea due to a medication or substance), that diagnosis along with a diagnosis of Obstructive sleep apnoea should be given, rather than a diagnosis of treatment-emergent central sleep apnoea.
- Note: A definitive diagnosis requires objective evidence based on polysomnography.
- 7A40.Y Other specified central sleep apnoeas**
- 7A40.Z Central sleep apnoeas, unspecified**

**7A41****Obstructive sleep apnoea**

Obstructive sleep apnoea is characterised by repetitive episodes of apnoea or hypopnea that are caused by upper airway obstruction occurring during sleep. These events often result in reductions in blood oxygen saturation and are usually terminated by brief arousals from sleep. Excessive sleepiness is a major presenting complaint in many but not all cases. Reports of insomnia, poor sleep quality, and fatigue are also common. Upper airway resistance syndrome shares the same pathophysiology and should be classified here. In adults (> 18 years), obstructive sleep apnoea is diagnosed when the frequency of obstructive events (apnoeas, hypopneas or respiratory-event related arousals) is greater than 15 per hour. The disorder may also be diagnosed when the frequency is greater than five per hour and: a) symptoms attributable to the disorder (e.g., sleepiness or sleep disruption) are present; or b) nocturnal respiratory distress or observed apnoea/habitual snoring are reported; or c) when hypertension, a mood disorder, cognitive dysfunction, coronary artery disease, stroke, congestive heart failure, atrial fibrillation, or type 2 diabetes mellitus are present. In children, the disorder is diagnosed when the frequency of obstructive events is greater than one per hour, accompanied by signs or symptoms related to the breathing disorder.

Note: A definitive diagnosis requires objective evidence based on polysomnography.

**Exclusions:** Obstructive neonatal apnoea (KB2A.1)

**7A42****Sleep-related hypoventilation or hypoxemia disorders**

The primary feature of these disorders is insufficient sleep related ventilation, resulting in abnormally elevated arterial partial pressure of carbon dioxide (PaCO<sub>2</sub>) during sleep. Sleep-related hypoxemia is diagnosed when overnight monitoring reveals sustained (> 5 minutes) decline in oxygen saturation to ≤ 88% in adults (or ≤ 90% in children) for ≥ 5 minutes.

Note: A definitive diagnosis requires objective evidence based on polysomnography as well as carbon dioxide (CO<sub>2</sub>) monitoring during sleep (by arterial, end-tidal or transcutaneous measures).

**7A42.0****Obesity hypoventilation syndrome**

Obesity hypoventilation syndrome is characterised by obesity (in adults, Body-Mass-Index > 30 kg/m<sup>2</sup>) and daytime hypercapnia indicated by arterial partial pressure of carbon dioxide (PaCO<sub>2</sub>) > 45 mm Hg that cannot be fully attributed to an underlying cardiopulmonary or neurologic disease. Hypercapnia worsens during sleep and is often associated with severe arterial oxygen desaturation. Obstructive sleep apnoea is also present in the majority of cases and should be diagnosed in addition to obesity hypoventilation.

Note: A definitive diagnosis requires demonstration of daytime hypercapnia and objective evidence based on polysomnography, with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

**Inclusions:** Pickwickian syndrome

**7A42.1****Congenital central alveolar sleep-related hypoventilation**

Congenital central alveolar hypoventilation syndrome (CCHS) is a disorder of autonomic dysfunction, primarily the failure of automatic central control of breathing, caused by a mutation of the PHOX2B gene. CCHS is characterised by hypoventilation, which is worse during sleep than wakefulness. Onset is usually at birth, and CCHS most commonly presents in an otherwise normal-appearing infant who is noted to have cyanosis, feeding difficulties, hypotonia or, less commonly, central apnoea. Severity is related to the specific mutation present. Individuals with milder variants of the disorder may not present for clinical attention until adulthood.

Note: A definitive diagnosis requires demonstration of PHOX2B mutation and objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

**7A42.2****Non-congenital central hypoventilation with hypothalamic abnormalities**

Non-congenital central hypoventilation with hypothalamic dysfunction is a disorder of central control of ventilation. Patients are usually healthy until early childhood (often 2-3 years of age) when they develop hyperphagia and severe obesity, followed by central hypoventilation, which often presents as respiratory failure. Hypothalamic endocrine dysfunction may be characterised by increased or decreased hormone levels and may include one or more of the following: diabetes insipidus, inappropriate antidiuretic hormone hypersecretion, precocious puberty, hypogonadism, hyperprolactinemia, hypothyroidism, and decreased growth hormone secretion, or tumours of neural origin. Mood and behaviour abnormalities, sometimes severe, are often present. Developmental delay or autistic features may be present, but many patients are cognitively normal.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

**7A42.3****Idiopathic central alveolar hypoventilation**

Idiopathic central alveolar hypoventilation is defined as the presence of decreased alveolar ventilation resulting in sleep related hypercapnia and hypoxemia in individuals with presumed normal mechanical properties of the lung and respiratory pump. Chronic hypoventilation during sleep exists without any readily identifiable impairments of respiration, such as pulmonary airway or parenchymal conditions, neurologic, neuromuscular or chest wall abnormalities, severe obesity, other sleep related breathing disorder, or use of respiratory depressant medications or substances. Diurnal as well as nocturnal hypoventilation is believed to be due primarily to blunted chemoresponsiveness to carbon dioxide (CO<sub>2</sub>) and oxygen (O<sub>2</sub>). Patients may complain of morning headaches, fatigue, neurocognitive decline and sleep disturbance, or may be entirely asymptomatic.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures).

**7A42.4****Sleep-related hypoventilation due to a medication or substance**

Sleep-related hypoventilation due to a medication or substance is characterised primarily by chronic hypoventilation and hypercapnia due to prolonged use of medications or substances known to depress ventilatory drive and/or impair respiratory muscle mechanics (e.g. long-acting narcotics, anesthetics, sedative compounds, and muscle relaxants). Hypoxemia is commonly present as well. Hypercapnia may also be present during wakefulness in some patients. Patients can either be asymptomatic or present with complaints of dyspnea, chest tightness, or fatigue.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures) in the context of medication or substance use that is judged to be causing the symptoms.

**7A42.5****Sleep-related hypoventilation due to medical condition**

Sleep-related hypoventilation due to medical condition is characterised by sleep-related hypoventilation due to lung airway or parenchymal disease, chest wall disorders, pulmonary hypertension, or neurologic and neuromuscular disorders. Daytime hypercapnia may also be present. Sleep related hypoxemia may be severe. Patients can either be asymptomatic or present with complaints of dyspnea, chest tightness, or fatigue.

Note: A definitive diagnosis requires objective evidence based on polysomnography with carbon dioxide (CO<sub>2</sub>) monitoring (by arterial, end-tidal or transcutaneous measures) in the presence of a medical condition that is judged to be causing the symptoms.

**Exclusions:**

Obesity hypoventilation syndrome (7A42.0)

Congenital central alveolar sleep-related hypoventilation  
(7A42.1)

**7A42.6****Sleep-related hypoxemia due to a medical condition**

Sleep related hypoxemia due to a medical condition is characterised by sustained declines in SpO<sub>2</sub> (oxygen saturation measured by pulse oximeter) ( $\leq 88\%$  in adults or  $\leq 90\%$  in children for  $\geq 5$  minutes) during sleep. The condition is attributable to a medical or neurological disorder. The presence of hypoxemia is not better explained by another sleep related breathing disorder (e.g., obstructive sleep apnoea). Although some amount of obstructive or central apnoea may be present, these disorders are not thought to be primarily responsible for the hypoxemia during sleep. Some patients with sleep related hypoxemia also exhibit hypoxemia during wakefulness. If the presence of hypercapnia has been established, a diagnosis of sleep-related hypoventilation should be made, rather than sleep-related hypoxemia.

Note: A definitive diagnosis requires objective evidence based on polysomnographic monitoring of oxygen saturation in arterial blood (SaO<sub>2</sub>) in the presence of a medical condition that is judged to be causing the declines in SaO<sub>2</sub>.

**7A42.Y****Other specified sleep-related hypoventilation or hypoxemia disorders****7A42.Z****Sleep-related hypoventilation or hypoxemia disorders, unspecified****7A4Y****Other specified sleep-related breathing disorders**

## Circadian rhythm sleep-wake disorders (7A60-7A6Z)

Circadian rhythm sleep-wake disorders are disturbances of the sleep-wake cycle (typically manifest as insomnia, excessive sleepiness, or both) due to alterations of the circadian time-keeping system, its entrainment mechanisms, or a misalignment of the endogenous circadian rhythm and the external environment. Sleep logs and, if possible, actigraphy for a minimum of one week should be utilized to define the specific sleep-wake schedule disturbance.

**Inclusions:** Delayed sleep phase syndrome  
Irregular sleep-wake pattern

### 7A60

#### Delayed sleep-wake phase disorder

Delayed sleep-wake phase disorder is a recurrent pattern of disturbance of the sleep-wake schedule characterised by persistent delay in the major sleep period compared to conventional or desired sleep times. The disorder results in difficulty falling asleep and difficulty awakening at desired or required times. When sleep is allowed to occur on the delayed schedule, it is essentially normal in quality and duration. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

### 7A61

#### Advanced sleep-wake phase disorder

Advanced sleep-wake phase disorder is a recurrent pattern of disturbance of the sleep-wake schedule characterised by persistent advance (to an earlier time) of the major sleep period compared to conventional or desired sleep times. The disorder results in evening sleepiness (prior to the desired bedtime) and awakening earlier than the desired or required times. When sleep is allowed to occur on the advanced schedule, it is essentially normal in quality and duration. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

### 7A62

#### Irregular sleep-wake rhythm disorder

Irregular sleep-wake rhythm disorder is characterised by absence of a clearly-defined cycle of sleep and wake. Sleep becomes distributed in multiple episodes of variable duration throughout the 24-hour period. Patients typically complain of insomnia and/or excessive daytime sleepiness as a result of the condition. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A63**

**Non-24 hour sleep-wake rhythm disorder**

Non-24 hour sleep-wake rhythm disorder is characterised by periods of insomnia and/or daytime sleepiness, alternating with periods of relatively normal sleep, due to a lack of entrainment of the circadian clock to the 24-hour environmental cycle. The period length of the circadian/sleep-wake cycle is typically longer than 24 hours. Symptoms occur as the circadian-controlled sleep-wake propensity cycles in and out of phase with the environmental day-night cycle. The disorder is seen most commonly in individuals with complete blindness. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A64**

**Circadian rhythm sleep-wake disorder, shift work type**

Circadian rhythm sleep-wake disorder, shift work type is characterised by complaints of insomnia and/or excessive sleepiness that occur as a result of work shifts that overlap with all or a portion of conventional nighttime sleep periods. The disorder is also associated with a reduction in total sleep time. The symptoms should have persisted for at least several months and result in significant distress or mental, physical, social, occupational or academic impairment.

**7A65**

**Circadian rhythm sleep-wake disorder, jet lag type**

Circadian rhythm sleep-wake disorder, jet lag type is characterised by a temporary mismatch between the timing of the sleep and wake cycle generated by the endogenous circadian clock and that of the sleep and wake pattern required by transmeridian travel across at least two time zones. Individuals complain of disturbed sleep, sleepiness and fatigue, somatic symptoms (e.g. gastrointestinal distress) or impaired daytime function. The severity and duration of symptoms is dependent on the number of time zones traveled, the ability to sleep while traveling, exposure to appropriate circadian times cues in the new environment, tolerance to circadian misalignment when awake during the biological night, and the direction of the travel. The symptoms result in significant distress or mental, physical, social, occupational or academic impairment.

**7A6Z**

**Circadian rhythm sleep-wake disorders, unspecified**

## Sleep-related movement disorders (7A80-7A8Z)

Sleep related movement disorders are primarily characterised by relatively simple, usually stereotyped, movements that disturb sleep or its onset. An exception is Restless legs syndrome, which is primarily a waking, sensorimotor experience but is included in Sleep-related movement disorders because it almost always also involves periodic limb movements during sleep.

**Coded Elsewhere:** REM sleep behaviour disorder (7B01.0)

### 7A80

#### **Restless legs syndrome**

Restless legs syndrome is a waking sensorimotor disorder characterised by a complaint of a strong, nearly irresistible urge to move the limbs. This urge to move is often but not always accompanied by other uncomfortable sensations felt deep inside the limbs. Although the legs are most prominently affected, a significant percentage of individuals with Restless legs syndrome describe some arm sensations. The symptoms of Restless legs syndrome are worse at rest, alleviated with movement, and predominant in the evening or night. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep). The vast majority of individuals with Restless legs syndrome also exhibit periodic limb movements during sleep. A separate diagnosis of Periodic limb movement disorder is not warranted in such cases because the limb movements during sleep are considered to be an expected part of Restless legs syndrome.

### 7A81

#### **Periodic limb movement disorder**

Periodic limb movement disorder is characterised by periodic episodes of repetitive (> 5/hour in children or > 15/hour in adults), highly stereotyped limb movements that occur during sleep, in conjunction with significant difficulties with sleep initiation or maintenance or fatigue that cannot be accounted for by another primary sleep disorder or other etiology. Specifically, when periodic limb movements are associated with Restless legs syndrome, narcolepsy or REM sleep behaviour disorder, a separate diagnosis of Periodic limb movement disorder is not warranted because the limb movements during sleep are considered an expected part of these disorders. Periodic limb movements occur most frequently in the lower extremities but may be seen in the arms as well. They may be associated with recurrent arousal from sleep, which gives rise to sleep disruption. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep).

Note: A definitive diagnosis requires objective evidence based on polysomnography.

### 7A82

#### **Sleep-related leg cramps**

Sleep related leg cramps are painful sensations in the leg or foot associated with sudden, involuntary muscle hardness or tightness, indicating a strong muscle contraction. They typically last from a few seconds to several minutes. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep).

**7A83****Sleep-related bruxism**

Sleep-related bruxism is characterised by repetitive, rhythmic jaw muscle contractions that occur during sleep. These contractions can take the form of repetitive phasic muscle contractions or isolated sustained jaw clenching (tonic contractions). These contractions during sleep produce tooth-grinding sounds. The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep) or significant damage to the teeth.

**7A84****Sleep-related rhythmic movement disorder**

Sleep related rhythmic movement disorder is characterised by repetitive, stereotyped, and rhythmic motor behaviours that involve large muscle groups (e.g., banging head against pillow or mattress, head rolling, body rocking, body rolling). The symptoms are sufficiently severe to result in significant distress or impairment in personal, family, social, educational, occupational or other important areas of functioning (e.g., due to frequent disruptions in sleep) or result in bodily injury (e.g., due to falling out of bed).

**7A85****Benign sleep myoclonus of infancy**

Benign sleep myoclonus of infancy is characterised by repetitive myoclonic jerks that occur during sleep in neonates and infants. Benign sleep myoclonus of infancy is commonly confused with epilepsy. However, unlike the jerks of myoclonic seizures and myoclonic encephalopathy, the jerks of Benign sleep myoclonus of infancy occur exclusively during sleep. The jerks are often bilateral and massive, typically involving large muscle groups.

**7A86****Propriospinal myoclonus at sleep onset**

Propriospinal myoclonus at sleep onset consists of sudden myoclonic jerks of the trunk, hips, and knees in a fixed pattern that occur during the transition from wakefulness to sleep and, more rarely, during nighttime awakenings or upon awakening in the morning. The jerks arise mainly in spinally innervated muscles and thereafter propagate to rostral and caudal muscles at a low speed, typical of propriospinal pathways. The movements result in clinically significant difficulty with sleep initiation or maintenance.

**7A87****Sleep-related movement disorder due to a medical condition**

Sleep-related movement disorder due to a medical condition is characterised by sleep-related movement abnormalities that are directly attributable to an underlying neurological or medical condition. Many medical conditions, particularly diseases of the nervous system, may be associated with movement abnormalities that are evident in wake and sleep. In some cases, the nocturnal manifestations of the movement abnormalities may be apparent before establishment of a firm neurological diagnosis. Once the presence of a medical or neurological condition is clearly established, this diagnosis should only be assigned if the sleep-related aspects of the movement abnormality or its sequelae are the focus of independent clinical attention.

**Coding Note:** Code also the causing condition

**7A88****Sleep-related movement disorder due to a medication or substance**

Sleep-related movement disorder due to a medication or substance is characterised by sleep-related movement abnormalities that are directly attributable to the effect of a medication or substance. Many substances may be associated with movement abnormalities that are evident in wake and sleep. To the extent that the movement abnormality is an expected complication of the substance(s) involved (e.g., tardive dyskinesia or akathisia associated with neuroleptic usage), this diagnosis should only be assigned if the sleep-related aspects of the movement abnormality or its sequelae are the focus of independent clinical attention.

**7A8Y****Other specified sleep-related movement disorders****7A8Z****Sleep-related movement disorders, unspecified****Parasomnia disorders (7B00-7B0Z)**

Parasomnias are problematic behavioural or physiological events that occur while falling asleep, during sleep, or upon arousal from sleep. Parasomnias may occur during non-rapid eye movement sleep (NREM), rapid eye movement sleep (REM), or during transitions to and from sleep. They encompass abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, and autonomic nervous system activity.

**7B00****Disorders of arousal from non-REM sleep**

Disorders of arousal from non-REM sleep are characterised by experiences or behaviours such as confusion, ambulation, terror, or extreme autonomic arousal that typically arise as a result of incomplete arousals from deep non-REM (N3) sleep. An exception is sleep-related eating disorder, which has been observed to arise during all stages of non-REM sleep. This group of disorders is also characterised by partial or complete amnesia for the event, inappropriate or absent responsiveness to efforts by others to intervene or redirect the person during the episode, and limited (e.g., a single visual scene) or no associated cognition or dream imagery. The experiences or behaviours are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others (e.g., thrashing or striking out in response to efforts to restrain the individual).

**7B00.0****Confusional arousals**

Confusional arousals are characterised by mental confusion or confused behaviour (e.g., disorientation, being unresponsive, impaired or slow speech, poor memory) during a partial arousal from deep sleep. There is partial or complete amnesia for the events. The experiences or behaviours are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.

**7B00.1****Sleepwalking disorder**

Sleepwalking disorder is characterised by ambulation and other complex behaviours during a partial arousal from deep sleep.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>7B00.2</b> | <p><b>Sleep terrors</b></p> <p>Sleep terrors are characterised by episodes of abrupt terror during a partial arousal from deep sleep, typically beginning with a vocalization such as a frightening scream. The individual experiences intense fear accompanied by signs of autonomic arousal, such as mydriasis, tachycardia, tachypnea, and diaphoresis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>7B00.3</b> | <p><b>Sleep-related eating disorder</b></p> <p>Sleep-related eating disorder is characterised by recurrent episodes of involuntary excessive or dangerous eating or drinking that occur during the main sleep period that are not attributable to the effects of a medication or substance. Episodes may involve consumption of peculiar forms or combinations of food or inedible or toxic substances or injurious or potentially injurious behaviours performed while in pursuit of food or while cooking food. There may be adverse health consequences from recurrent nocturnal binge eating of high calorie foods. There is partial or complete amnesia for the events.</p>                                                                                                                                |
| <b>7B00.Y</b> | <b>Other specified disorders of arousal from non-REM sleep</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>7B00.Z</b> | <b>Disorders of arousal from non-REM sleep, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>7B01</b>   | <p><b>Parasomnias related to REM sleep</b></p> <p>Parasomnias related to REM (rapid eye movement) sleep are characterised by experiences or behaviours such as vocalization or complex motor behaviours, sleep paralysis, or nightmares that are associated with REM sleep. The experiences are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.</p>                                                                                                                                                                                                                                                                |
| <b>7B01.0</b> | <p><b>REM sleep behaviour disorder</b></p> <p>REM sleep behaviour disorder is characterised by repeated episodes of sleep related vocalization or complex motor behaviours that are either documented by polysomnography to occur during REM (rapid eye movement) sleep or are presumed to occur during REM sleep due to a clinical history of dream enactment. Polysomnographic recording (when performed) demonstrates REM sleep without atonia. The disorder may occur as an isolated, idiopathic form but is frequently associated with latent or manifest disease of the nervous system, especially alpha-synucleinopathies.</p> <p>Note: A provisional diagnosis may be established on clinical grounds but definitive diagnosis requires polysomnographic demonstration of REM sleep without atonia.</p> |
| <b>7B01.1</b> | <p><b>Recurrent isolated sleep paralysis</b></p> <p>Recurrent isolated sleep paralysis consists of recurrent inability to move the trunk and all of the limbs at sleep onset (hypnagogic) or upon awakening (hypnopompic) from sleep. Episodes typically last from a few seconds to a few minutes and cause clinically significant distress including bedtime anxiety or fear of sleep.</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>7B01.2</b> | <b>Nightmare disorder</b><br>Nightmare disorder is characterised by recurrent, vivid and highly dysphoric dreams, often involving threat to the individual, that generally occur during REM sleep and that often result in awakening with anxiety. The person is rapidly oriented and alert upon awakening.<br><i>Inclusions:</i> Dream anxiety disorder                                                                                                                                                                                                                                                                                          |
| <b>7B01.Y</b> | <b>Other specified parasomnias related to REM sleep</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>7B01.Z</b> | <b>Parasomnias related to REM sleep, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>7B02</b>   | <b>Other parasomnias</b><br>Other parasomnias include Hypnagogic exploding head syndrome, Sleep-related hallucinations, and abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, or autonomic nervous system activity related to a medical condition or due to a medication or substance. The experiences are sufficiently severe to result in significant distress or significant impairment in personal, family, social, educational, occupational or other important areas of functioning or significant risk of injury to the individual or to others.<br><i>Coded Elsewhere:</i> Nocturnal enuresis (6C00.0) |
| <b>7B02.0</b> | <b>Hypnagogic exploding head syndrome</b><br>Hypnagogic exploding head syndrome is characterised by the perception of a sudden, loud noise or sense of a violent explosion in the head that typically occurs as the individual is falling asleep. On occasion, these episodes may occur with awakening during the night. They are associated with abrupt arousal following the event, often with a sense of fright.<br><i>Inclusions:</i> Hypnagogic sensory disturbance                                                                                                                                                                          |
| <b>7B02.1</b> | <b>Sleep-related hallucinations</b><br>Sleep related hallucinations are hallucinatory experiences that occur at sleep onset (hypnagogic hallucinations) or on awakening from sleep (hypnopompic hallucinations). Sleep related hallucinations are predominantly visual but may include auditory, tactile, or kinetic phenomena.                                                                                                                                                                                                                                                                                                                   |
| <b>7B02.2</b> | <b>Parasomnia disorder due to a medical condition</b><br>Parasomnia disorder due to a medical condition is characterised by abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, or autonomic nervous system activity that are directly attributable to an underlying neurological or medical condition.                                                                                                                                                                                                                                                                                                          |
| <b>7B02.3</b> | <b>Parasomnia disorder due to a medication or substance</b><br>Parasomnia disorder due to a medication or substance is characterised by abnormal sleep related complex movements, behaviours, emotions, perceptions, dreams, and autonomic nervous system activity that are directly attributable to the effect of a medication or substance.                                                                                                                                                                                                                                                                                                     |
| <b>7B0Y</b>   | <b>Other specified parasomnia disorders</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>7B0Z</b>   | <b>Parasomnia disorders, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## CHAPTER 08

---

### Diseases of the nervous system

This chapter has 204 four-character categories.

Code range starts with 8A00

This is a group of conditions characterised as being in or associated with the nervous system.

**Exclusions:** Endocrine, nutritional or metabolic diseases (Chapter 05)  
Complications of pregnancy, childbirth and the puerperium (Chapter 18)  
Certain conditions originating in the perinatal period (Chapter 19)  
Injury, poisoning or certain other consequences of external causes (Chapter 22)

**Coded Elsewhere:** Injuries of the nervous system  
Neoplasms of the nervous system  
Structural developmental anomalies of the nervous system (LA00-LA0Z)  
Syndromes with central nervous system anomalies as a major feature (LD20)  
Non-viral and unspecified infections of the central nervous system (1D00-1D0Z)  
Symptoms, signs or clinical findings of the nervous system (MB40-MB9Y)  
Paralytic symptoms (MB50-MB5Z)  
Dissociative neurological symptom disorder (6B60)  
Diseases of the nervous system complicating pregnancy, childbirth or the puerperium (JB64.3)

This chapter contains the following top level blocks:

- Movement disorders
- Disorders with neurocognitive impairment as a major feature
- Multiple sclerosis or other white matter disorders
- Epilepsy or seizures
- Headache disorders
- Cerebrovascular diseases
- Spinal cord disorders excluding trauma
- Motor neuron diseases or related disorders
- Disorders of nerve root, plexus or peripheral nerves
- Diseases of neuromuscular junction or muscle
- Cerebral palsy
- Nutritional or toxic disorders of the nervous system
- Disorders of cerebrospinal fluid pressure or flow

- Disorders of autonomic nervous system
- Human prion diseases
- Disorders of consciousness
- Other disorders of the nervous system
- Postprocedural disorders of the nervous system
- Injuries of the nervous system
- Neoplasms of the nervous system

## Movement disorders (8A00-8A0Z)

This is a group of involuntary movement disorders.

**Coded Elsewhere:** Restless legs syndrome (7A80)

Periodic limb movement disorder (7A81)

Hemifacial spasm (8B88.2)

### 8A00

#### Parkinsonism

Parkinsonism is a clinical syndrome characterised by four cardinal features: rest tremor, muscular rigidity, akinesia or bradykinesia, and postural disturbances which include shuffling gait and flexed posture and loss of postural reflexes. Bradykinesia and one other clinical feature is required to make a diagnosis of Parkinsonism. Parkinsonism may result from a variety of conditions including progressive neurodegenerative disorders such as Parkinson Disease or Atypical Parkinsonism where the progressive degeneration of nigral and other neurons leads to dopamine deficiency. Parkinsonism may also be a result of structural lesions such as strokes or tumours or blockage of dopamine receptors in the striatum by drugs such as neuroleptics.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Arthropathies (FA00-FA5Z)

### 8A00.0

#### Parkinson disease

Parkinson Disease is a gradual onset progressive degenerative disease whose cardinal manifestations include bradykinesia plus one of the following-tremor, rigidity or postural instability. Nonmotor manifestations include autonomic dysfunction and neuropsychiatric features.

### 8A00.00

#### Sporadic Parkinson disease

This is defined as Parkinson Disease occurring sporadically with no apparent mode of inheritance.

### 8A00.01

#### Familial Parkinson disease

Familial subtype of Parkinson Disease, a disorder caused by progressive dopaminergic neuron degeneration of the substantia nigra that is characterized by resting tremor, bradykinesia, and rigidity. Familial cases can be caused by mutations in LRRK2, PARK7, PINK1, PRKN, or SNCA genes.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>8A01.10</b>      | Huntington disease<br>Huntington disease (HD) is a rare neurodegenerative disorder of the central nervous system. HD is an autosomal dominant disorder due to a mutation resulting in an increased number of triplicate cytosine-adenine-guanine repeats on chromosome 4. The manifestations include chorea, dementia and personality changes. In the Westphal variant dystonia and parkinsonism are prominent. Neuroimaging reveals caudate atrophy. A genetic test is available and may facilitate presymptomatic detection.<br><b>Inclusions:</b> Huntington chorea |
| <b>8A01.11</b>      | Chorea due to Huntington disease-like conditions<br>The clinical picture of Huntington Disease (HD) is closely mimicked by disorders with an autosomal dominant inheritance. The gene test for HDS is negative prompting the consideration of other disorders. These are called HD like (HDL diseases).                                                                                                                                                                                                                                                                |

**8A05****Tic disorders**

Disorders characterized by brief, sudden, repetitive movements (motor tics) or utterances (phonic or vocal tics) that are temporarily suppressible and are usually preceded by a strong urge to perform the tic. The most common cause of childhood-onset tics is Tourette Syndrome.

**8A05.0****Primary tics or tic disorders**

Primary tics or tic disorders are characterised by the presence of chronic motor and/or vocal (phonic) tics. Motor and vocal tics are defined as sudden, rapid, non-rhythmic, and recurrent movements or vocalizations, respectively. In order to be diagnosed, tics must have been present for at least one year, although they may not manifest consistently.

**8A05.00****Tourette syndrome**

Tourette syndrome is a chronic tic disorder characterised by the presence of both chronic motor tics and vocal (phonic) tics, with onset during the developmental period. Motor and vocal tics are defined as sudden, rapid, non-rhythmic, and recurrent movements or vocalizations, respectively. In order to be diagnosed as Tourette syndrome, both motor and vocal tics must have been present for at least one year, although they may not manifest concurrently or consistently throughout the symptomatic course.

**Inclusions:** Combined vocal and multiple motor tic disorder

**8A05.01****Chronic motor tic disorder**

Chronic motor tic disorder is characterised by the presence of motor tics over a period of at least one year, although they may not manifest consistently. Motor tics are defined as sudden, rapid, non-rhythmic, and recurrent movements.

**Exclusions:** Tourette syndrome (8A05.00)

**8A05.02****Chronic phonic tic disorder**

Chronic phonic tic disorder is characterised by the presence of phonic (vocal) tics over a period of at least one year, although they may not manifest consistently. Phonic tics are defined as sudden, rapid, non-rhythmic, and recurrent vocalizations.

**Exclusions:** Tourette syndrome (8A05.00)

**8A05.03****Transient motor tics**

Tics are sudden, non-rhythmic stereotyped movements such as blinking, sniffing, tapping, etc. They should have been present for less than 1 year.

**8A05.0Y****Other specified primary tics or tic disorders****8A05.0Z****Primary tics or tic disorders, unspecified****8A05.1****Secondary tics**

A tic disorder as a direct physiologic consequence of an antecedent infection, drugs or illness.

**Coding Note:** Code also the causing condition

Essential myoclonus tends to be stable without increasing in severity over time. More recently, it is believed that essential myoclonus may be the same as myoclonus-dystonia caused by a mutation in the sarcoglycan gene.                                                 |
| <b>8A06.1</b>       | <b>Segmental myoclonus</b><br>Rhythmic or semi-rhythmic involuntary contractions of muscle groups supplied by one or more contiguous segments of the brainstem and/or spinal cord.                                                                                                                                                                                                                                              |
| <b>8A06.2</b>       | <b>Focal myoclonus</b><br>Sudden, involuntary twitching or jerking of a muscle or group of muscles which effects a localised area of the body.                                                                                                                                                                                                                                                                                  |
| <b>8A06.20</b>      | Palatal myoclonus<br>Palatal myoclonus is usually a rhythmic, continuous movement of the muscles of the middle ear or palate, but can also include muscle of the eye, tongue, neck and diaphragm. The movement may be present in sleep or with distraction with a frequency of 1.5 to 3 Hz. Essential palatal myoclonus is more likely to have an associated rhythmic clicking noise compared to symptomatic palatal myoclonus. |
| <b>8A06.21</b>      | Chronic hiccups<br>Chronic hiccup is a rare disorder causing repeated inspiratory spasms over periods of 48 hours or more.                                                                                                                                                                                                                                                                                                      |

## Disorders with neurocognitive impairment as a major feature (8A20-8A2Z)

**8A20 Alzheimer disease**

**8A21 Progressive focal atrophies**

Progressive cortical atrophies are neurodegenerative diseases with progressive impairment in a single cognitive domain secondary to circumscribed cerebral atrophy.

**8A21.0 Posterior cortical atrophy**

Benson's syndrome or Posterior Cortical Atrophy (PCA) refers to a clinical syndrome in which higher order visual processing is disrupted owing to a neurodegenerative disorder. The patients present with progressive and severe visual agnosia (inability to recognize and identify familiar objects or persons) and apraxia (loss in the ability to execute or perform skilled familiar movements).

**8A21.Y Other specified progressive focal atrophies**

**8A21.Z Progressive focal atrophies, unspecified**

**8A22 Lewy body disease**

Lewy body disease is a neurodegenerative disorder and the second most common form of dementia in the elderly after Alzheimer disease. Lewy bodies are histologically defined as intracytoplasmic eosinophilic neuronal inclusions in the cortex or brainstem.

**8A23 Frontotemporal lobar degeneration**

**8A2Y Other specified disorders with neurocognitive impairment as a major feature**

**8A2Z Disorders with neurocognitive impairment as a major feature, unspecified**

## Multiple sclerosis or other white matter disorders (8A40-8A4Z)

This is a group of conditions involving demyelination, damage to the myelin sheath which protects nerve axons and is responsible for neurotransmission.

**8A40 Multiple sclerosis**

Multiple Sclerosis (MS) is a chronic, inflammatory demyelinating disease of the central nervous system. Three categories of multiple sclerosis have been outlined: Relapsing/remitting, secondary progressive and primary progressive multiple sclerosis.

**Coded Elsewhere:** Retrobulbar neuritis in multiple sclerosis (9C40.1Y)

**8A40.0 Relapsing-remitting multiple sclerosis**

Clearly defined disease relapses with full recovery or with sequelae and residual deficit upon recovery. The periods between disease relapses are characterised by a lack of disease progression.

| <b>8A42</b>   | <b>Acute disseminated encephalomyelitis</b><br>Acute disseminated encephalomyelitis is a demyelinating disorder of the central nervous system. It usually develops after acute viral or bacterial infection or vaccination, with a sudden onset of irritability and lethargy after a prodromal period of 1-4 weeks. Major symptoms include fever, headache, drowsiness, changes in mental status, seizures and coma. Weakness, vomiting, weight loss, stiff neck, ataxia, bilateral optic neuritis and delirium are common. Peripheral nervous system involvement (paralysis of a single limb or hemiplegia) may occur.                                                                                                                                                                                   |

| <b>8A43</b>   | <b>Neuromyelitis optica</b><br>#DRAFT# Neuromyelitis optica (NMO) is an inflammatory demyelinating disease of the central nervous system characterised mainly by attacks of uni- or bilateral optic neuritis (ON) and acute longitudinally extensive (> 3 vertebral segments) myelitis. Less common manifestations include attacks of severe nausea and vomiting from area postrema lesions. Aquaporin-4 antibody (AQP4-IgG) is a sensitive (60-80%) and highly specific (>99%) serum biomarker which aids diagnosis of NMO. Both in vivo and in vitro studies support a pathogenic role for AQP4-IgG. Associated neural autoantibodies include aquaporin-4 autoantibodies (AQP4-IgG).<br><br><b>Coded Elsewhere:</b> Neuromyelitis optica myelin oligodendrocyte glycoprotein antibody-positive (8A41.1) |

- 8A44.2 Alexander disease**  
 Alexander's disease is a neurodegenerative disorder encompassing different clinical forms: the infantile form (birth to 2 years), the most common, is characterised by its early onset and severe evolution with progressive megalencephaly (sometimes hydrocephaly), retarded psychomotor development or mental deterioration, pyramidal signs, ataxia and convulsive seizures. The juvenile forms start in school-aged children and associate spastic paraplegia and progressive bulbar signs. Adult forms are heterogeneous and difficult to diagnose.
- 8A44.3 Certain specified leukodystrophies**  
**Coded Elsewhere:** Phenylketonuria (5C50.0)  
 Refsum disease (5C57.1)  
 Cerebrotendinous xanthomatosis (5C52.11)  
 Leber hereditary optic neuropathy (8C73.Y)  
 Cystic leukoencephalopathy without megalencephaly (5C55.2)  
 Gaucher disease (5C56.0Y)  
 Niemann-Pick disease (5C56.0Y)  
 Tay-Sachs disease (5C56.00)  
 Oculo-dento-digital dysplasia (LD27.0Y)
- 8A44.4 Krabbe disease**  
 Krabbe disease, also called globoid cell leukodystrophy, is a sphingolipidosis resulting from galactosylceramidase (or galactocerebrosidase) deficiency, a lysosomal enzyme that catabolizes a major lipid component of myelin. The disease leads to demyelination of the central and peripheral nervous system which is rapidly progressive from the first year of life, but juvenile, adolescent or adult onset forms have also been reported, with a more variable rate of progression.
- 8A44.Z Leukodystrophies, unspecified**
- 8A45 Secondary white matter disorders**  
**Coding Note:** Code also the causing condition
- 8A45.0 White matter disorders due to infections**  
**Coded Elsewhere:** Tabes dorsalis (1A62.01)
- 8A45.00 Human T-cell lymphotropic virus-associated myelopathy**  
 Human T-cell lymphotropic virus (HTLV) is a retrovirus and causes immune mediated diseases of the nervous system. Human T-cell lymphotropic virus type 1 (HTLV-1) and Human T-cell lymphotropic virus type 2 (HTLV-2) are closely related retroviruses with similar biological properties and common modes of transport.  
**Coded Elsewhere:** Myelitis due to Human T-lymphotropic virus type 1 (1D02.1)

| <b>8A45.20</b> | <p>White matter disorder due to CADASIL</p> <p>#DRAFT# In CADASIL, clinical and neuroimaging features resemble those of sporadic small-artery disease, although patients with CADASIL have an earlier age at onset of stroke events, an increased frequency of migraine with aura, and a slightly variable pattern of ischaemic white-matter lesions on brain MRI. MRI changes usually precede the onset of other symptoms by 10–15 years. The first changes are nodular white matter lesions in the periventricular areas and in the centrum semiovale. The abnormalities then typically become diffuse, symmetrical, and involve the external capsule and characteristically extend into the anterior temporal lobes to involve the temporal pole—a characteristic but not sensitive feature.</p> |
| <b>8A45.21</b> | <p>Subacute necrotising myelitis</p> <p>Foix-Alajouanine syndrome, also called subacute ascending necrotising myelitis, results from chronic congestion of the extrinsic pial veins of the spinal cord and of the intrinsic subpial network. It is characterised by progressive ascending deficit over a period of several months or years.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

- 8A45.30** White matter disorder due to vitamin B12 deficiency
- Neurological features occur in 40% of patients with B12 deficiency. Subacute combined degeneration is a potentially reversible neurological complication of a vitamin B12 deficiency. Symptoms develop insidiously and neuropathic manifestations include progressive paraesthesia distally, numbness, gait ataxia and diminished proprioception in the lower limbs, while the myelopathic component leads to variable motor impairment due to pyramidal tract dysfunction. Incontinence of bowel and bladder with impotence and postural hypotension occur as part of the myelopathy. Central manifestations include confusion, depression, progressive hallucination and mental slowing. There may also be optic neuropathy present.
- 8A45.31** Central pontine myelinolysis
- #DRAFT# This is a noninflammatory demyelinating disorder. The condition is associated with rapid correction of hyponatraemia which leads to shift of fluid from the intracellular to the extracellular compartments causing dehydration of the brain resulting in non-inflammatory damage to the myelin sheath and the oligodendrocytes with relative sparing of neurons and axons. The pons, a portion of the brainstem, is characteristically affected.
- 8A45.3Y** Other specified white matter disorders due to nutritional deficiency
- 8A45.3Z** White matter disorders due to nutritional deficiency, unspecified
- 8A45.4** **White matter disorders due to certain specified systemic disease**
- 8A45.40** Demyelination due to sarcoidosis
- Sarcoidosis can affect any part of the nervous system. It is estimated that about 5-15% of cases develop evidence of central nervous system involvement. Neurosarcoidosis may manifest in many different ways, diagnosis may be difficult. Neurosarcoidosis can appear in an acute explosive fashion or as a slow, chronic illness. Any part of the central nervous system can be attacked by sarcoidosis but chronic neurosarcoidosis can cause multiple cranial nerve palsies, parenchymatous cerebral involvement, hydrocephalus and encephalopathy or peripheral nervous system manifestations.
- 8A45.41** Demyelination due to systemic lupus erythematosus
- Among the 12 systemic lupus erythematosus (SLE)-related central nervous system (CNS) syndromes defined by the American College of Rheumatology (ACR), demyelinating syndrome and myelopathy are two of the less prevalent and more poorly understood ones. One important issue concerning demyelinating disease in SLE is that it can be easily misdiagnosed with other central nervous system demyelinating disorders such as multiple sclerosis (MS).
- 8A45.42** Demyelination due to Sjögren disease
- 8A45.43** Demyelination due to Behcet disease

## Epilepsy or seizures (8A60-8A6Z)

At least 2 unprovoked (or reflex) seizures occurring more than 24 hours apart.

**Coding Note:** Use additional code, if desired, to identify the type of seizure.

**Exclusions:** Syncope (MG45)

**Coded Elsewhere:** Sudden unexpected death in epilepsy (MH15)

Neonatal seizures (KB06)

### 8A60

#### Epilepsy due to structural or metabolic conditions or diseases

Epilepsy occurring in relation to a distinct other structural or metabolic condition or disease that has been demonstrated to be associated with a substantially increased risk of developing epilepsy.

#### 8A60.0

##### Epilepsy due to prenatal or perinatal brain insults

Epilepsy occurring in relation to a distinct structural or metabolic condition or disease that has been demonstrated to be associated with a substantially increased risk of developing epilepsy, with the insult occurring before birth [prenatal] or between 22 weeks of gestation and 7 days after birth. Onset of epilepsy may be in infancy, childhood, or adulthood.

**Coding Note:** Code also the causing condition

**Exclusions:** Neonatal seizures (KB06)

#### 8A60.00

##### Epilepsy due to prenatal or perinatal vascular insults

Epilepsy occurring in relation to an ischemic stroke or haemorrhagic stroke, with the stroke occurring or presumed to occur before birth [prenatal] or between 22 weeks of gestation and 7 days after birth [perinatal]. No other conditions associated with a substantially increased risk of developing epilepsy are present. Onset of epilepsy may be in infancy, childhood, or adulthood.

**Coding Note:** Code also the causing condition

#### 8A60.01

##### Epilepsy due to neonatal hypoxic ischemic encephalopathy

#DRAFT# Epilepsy occurring in relation to a hypoxic ischemic encephalopathy, with the encephalopathy occurring or presumed to occur before birth [prenatal] or between 22 weeks of gestation and 7 days after birth [perinatal]. No other conditions associated with a substantially increased risk of developing epilepsy are present. Onset is most commonly in infancy.

#### 8A60.0Y

##### Epilepsy due to other prenatal or perinatal brain insults

**Coding Note:** Code also the causing condition

#### 8A60.0Z

##### Epilepsy due to unspecified prenatal or perinatal brain insults

**Coding Note:** Code also the causing condition

#### 8A60.1

##### Epilepsy due to cerebrovascular disorders

Epilepsy occurring in relation to a stroke, with onset at least one week following an ischemic or haemorrhagic stroke.

**Coding Note:** Code also the causing condition

- 8A60.2      Epilepsy due to degenerative brain disorders**  
Epilepsy in relation to a degenerative brain disorder known to be associated with seizures, such as certain neuronal storage disorders (e.g. adult neuronal ceroid lipofuscinosis), and certain mitochondrial disorders.
- Coding Note:**    Code also the causing condition
- 8A60.3      Epilepsy due to dementias**  
Epilepsy with onset in a patient with established diagnosis of dementia. Seizures may occur at any time after the disease onset. Focal onset seizures are the prevailing type in Alzheimer's disease while seizures with bilateral convulsive activity predominate in other dementing disorders. Myoclonus is another common finding in patients with Alzheimer's disease.
- Coding Note:**    Code also the causing condition
- 8A60.4      Epilepsy due to central nervous system infections or infestations**  
Epilepsy with onset in a patient with a documented CNS infection or infestation after the acute phase of the disease.
- Coding Note:**    Code also the causing condition
- 8A60.5      Epilepsy due to injuries to the head**  
Epilepsy occurring in relation to a traumatic brain injury. Onset is more than 1 week following the trauma, with risk increasing with the severity of brain injury.
- Coding Note:**    Code also the causing condition
- 8A60.6      Epilepsy due to tumours of the nervous system**  
Epilepsy occurring in relation to intracranial tumours. The epilepsy may be the presenting symptom of the tumour, which is located within or affects the cerebral cortex. The tumour may be a primary intracranial tumour or a metastatic tumour.
- Coding Note:**    Code also the causing condition
- 8A60.7      Epilepsy with mesial temporal sclerosis**  
Epilepsy associated with imaging and/or pathologic findings of mesial temporal sclerosis. Onset of epilepsy may be in childhood or adulthood. A history of prolonged febrile seizures is common.
- 8A60.8      Epilepsy due to immune disorders**  
Epilepsy in relation to immunological or autoimmune disorders, such as systemic lupus erythematosus [1], inflammatory bowel disease [2], and antibody associated encephalitis (e.g. NMDA receptors) [3]. Antibody associated encephalitis is often a limbic encephalitis, and is sometimes paraneoplastic. Excludes multiple sclerosis and other demyelinating disorders.
- Coding Note:**    Code also the causing condition
- 8A60.9      Epilepsy due to abnormalities of brain development**  
Epilepsy due to disorders of cortical development encompassing a wide range of etiologies, with effects that depend on the stage of brain development. Seizure types usually reflect the topology of the malformation.
- Coding Note:**    Code also the causing condition

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>8A60.A</b>       | <b>Epilepsy due to genetic syndromes with widespread or progressive effects</b><br>Epilepsy due to genetically determined conditions in which, as we currently understand it, there is a separate disorder interposed between the genetic defect and the epilepsy, for example, as in tuberous sclerosis. Includes epilepsy due to documented autosomal, X-linked, mitochondrial or chromosomal abnormalities.                                                  |
| <b>8A60.B</b>       | <b>Epilepsy due to multiple sclerosis or other demyelinating disorders</b><br>Epilepsy with onset in a patient with established diagnosis of multiple sclerosis (MS) or other demyelinating disorder. Seizures must occur during the disease course, but not in close temporal relationship with an acute phase. The duration of MS symptoms prior to first seizure is generally several years.                                                                 |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>8A60.Y</b>       | <b>Epilepsy due to other structural or metabolic condition or disease</b>                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>8A60.Z</b>       | <b>Epilepsy due to unspecified structural or metabolic condition or disease</b>                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>8A61</b>         | <b>Genetic or presumed genetic syndromes primarily expressed as epilepsy</b><br>The epilepsy is, as best as understood, the direct result of one or more known or presumed genetic defects in which seizures are the core symptom of the disorder.                                                                                                                                                                                                              |
| <b>8A61.0</b>       | <b>Genetic epileptic syndromes with neonatal onset</b><br>Epilepsy with onset in the first 30 days of life resulting from one or more known or presumed genetic defects in which seizures are the core symptom of the disorder.<br><br><b>Exclusions:</b> Neonatal seizures (KB06)<br>Epilepsy due to prenatal or perinatal brain insults (8A60.0)                                                                                                              |
| <b>8A61.00</b>      | Pyridoxal dependent epilepsy<br>Pyridoxal 5-phosphate dependent epilepsy usually presents with neonatal intractable seizures and is diagnosed by cerebrospinal fluid (CSF) analysis, gene testing, and clinical response. The majority of patients have pyridoxamine 5'-phosphate oxidase (PNPO) gene disease causing mutations. Early diagnosis and effective treatment can lead to a relatively favourable neurodevelopmental outcome.                        |
| <b>8A61.0Y</b>      | Other specified genetic epileptic syndromes with neonatal onset                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>8A61.0Z</b>      | Genetic epileptic syndromes with neonatal onset, unspecified                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>8A61.1</b>       | <b>Genetic epileptic syndromes with onset in infancy</b><br>Include a vast spectrum of phenotypes having in common a genetic background and the onset in infancy. They range from benign self-remitting to severe drug resistant syndromes. Family history of epilepsy is common in some syndromic entities and exceptional in others.                                                                                                                          |
| <b>8A61.10</b>      | Benign familial infantile epilepsy<br>Epilepsy characterised by the occurrence of repeated seizures in healthy infants with no prior medical history during the first year of life. The seizures manifest with motor arrest, impairment of consciousness, staring, eye and head deviation, and mild unilateral clonic convulsions. A family history of the same epilepsy is a constant finding. The pattern of inheritance is most probably autosomal dominant. |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>8A61.2</b>  | <p><b>Genetic epileptic syndromes with childhood onset</b></p> <p>#DRAFT# Epilepsy with onset in childhood resulting from known or presumed genetic defects(s) in which seizures are the core symptom of the disorder</p>                                                                                                                                                                                                                                                                                                |
| <b>8A61.20</b> | <p>Benign childhood epilepsy with centro-temporal spikes</p> <p>Epilepsy characterised by focal seizures, mainly during sleep, often with involvement of the mouth and face. Convulsive seizures may occur. A history of febrile seizures is common. Onset is maximal between 7 and 10 years of age. The electroencephalogram typically shows focal epileptiform discharges over one or both centrotemporal areas. Remission occurs before age 16 years.</p>                                                             |
| <b>8A61.21</b> | <p>Childhood absence epilepsy</p> <p>Epilepsy with onset in an otherwise normal child of 2 to 12 years of age, often with multiple daily brief staring episodes lasting an average of 10 seconds. Absence seizures are usually provoked by hyperventilation. The electroencephalogram shows ictal and interictal diffuse 2.5-3 cycles per second spike and wave discharges. The genetic pattern is probably polygenetic.</p>                                                                                             |
| <b>8A61.22</b> | <p>Epilepsy with myoclonic-astatic seizures</p> <p>Epilepsy beginning between the second and fifth year of life in a previously normal child with family history of seizures, that initially manifests as tonic-clonic seizures with myoclonic-astatic seizures beginning several weeks later. These seizures are characterised by a sudden loss of muscular tonus associated with forward or backward propulsion that may result in injury to the face and head if the patient falls.</p>                               |
| <b>8A61.23</b> | <p>Myoclonic absences or absences with myoclonias</p> <p>Childhood epileptic syndrome characterised by absence seizures associated with severe rhythmic bilateral myoclonic jerks. The EEG pattern shows rhythmic, bilateral, synchronous, symmetric 3-Hz spike and slow-waves discharges associated with EMG myoclonic bursts at 3 Hz, superimposed to a progressively increasing tonic contraction.</p>                                                                                                                |

| <b>8A61.40</b> | <p>Reflex epilepsies</p> <p>Reflex epilepsies are rare epileptic syndromes with seizures induced by specific triggering factors (either by visual, auditory, somato-sensitive or somato-motor stimulation, or by higher cortical function activities). Photosensitive epilepsies are the most frequent form. Spontaneous seizures may also occur. "Reflex seizures" can be classified into a simple "pure" reflex epilepsy and a complex group. The former comprises seizure triggered by simple sensory stimuli or by movements (photosensitive epilepsies). The latter are triggered by complex mental and emotional processes (verbal and non-verbal epilepsies).</p> |

**8A63****Seizure due to acute causes**

A clinical seizure occurring at the time of a systemic insult or in close temporal association with a documented brain insult.

**Coding Note:** Code also the causing condition

**Exclusions:** Migraine aura-triggered seizures (8A80.3)

**8A63.0****Febrile seizures**

Seizures associated with a rise of the body temperature in the absence of intracranial infection, metabolic disturbance, or history of afebrile seizures. They most commonly occur in children between the ages of 6 months and 5 years.

**8A63.00****Simple febrile seizures**

Febrile seizures lasting less than 15 minutes, with no focal features and no occurrence in series.

**8A63.01****Complex febrile seizures**

Febrile seizures lasting longer than 15 minutes and/or multiple episodes occurring within 24 hours and/or seizures with focal features.

**8A63.0Y****Other specified febrile seizures****8A63.0Z****Febrile seizures, unspecified****8A63.Y****Seizure due to other acute cause**

**Coding Note:** Code also the causing condition

**8A63.Z****Seizure due to unspecified acute cause**

**Coding Note:** Code also the causing condition

**8A64****Single seizure due to remote causes**

An unprovoked seizure occurring in a patient with no history of antecedent seizures but with abnormalities of brain development or a potentially responsible clinical condition (metabolic, structural, toxic). The temporal relationship with the CNS insult is beyond the interval estimated for the occurrence of acute symptomatic seizures. The CNS insult may be static or progressive.

**Coding Note:** Code also the causing condition

**8A65****Single unprovoked seizure**

A seizure occurring in the absence of a potentially responsible structural or metabolic condition or beyond the interval estimated for the occurrence of an acute symptomatic seizure.

**8A66****Status epilepticus**

Status epilepticus is defined as 5 min or more of (i) continuous clinical and/or electrographic seizure activity or (ii) recurrent seizure activity without recovery (returning to baseline) between seizures.

## Headache disorders (8A80-8A8Z)

**Exclusions:** Headache, not elsewhere classified (MB4D)

### **8A80**

#### **Migraine**

A primary headache disorder, in most cases episodic. Disabling attacks lasting 4-72 hours are characterised by moderate or severe headache, usually accompanied by nausea, vomiting and/or photophobia and phonophobia, and sometimes preceded by a short-lasting aura of unilateral fully-reversible visual, sensory or other central nervous system symptoms. In a small minority of cases headache, but not necessarily the associated symptoms, becomes very frequent, with loss of episodicity.

**Exclusions:** Headache, not elsewhere classified (MB4D)

#### **8A80.0**

##### **Migraine without aura**

Recurrent headache disorder manifesting in attacks lasting 4-72 hours. The duration of attacks may be shorter in children. Typical characteristics of the headache are unilateral location, pulsating quality, moderate or severe intensity, aggravation by routine physical activity and association with nausea and/or photophobia and phonophobia.

#### **8A80.1**

##### **Migraine with aura**

Recurrent attacks, lasting minutes, of unilateral fully-reversible visual, sensory or other central nervous system symptoms that usually develop gradually and are usually followed by headache and associated migraine symptoms.

#### **8A80.10**

Hemiplegic migraine

Migraine with aura including motor weakness.

#### **8A80.1Y**

Other specified migraine with aura

#### **8A80.1Z**

Migraine with aura, unspecified

#### **8A80.2**

##### **Chronic migraine**

Headache occurring on 15 or more days per month for more than three months, which, on at least eight days per month, has the features of migraine headache and is not associated with medication overuse.

#### **8A80.3**

##### **Complications related to migraine**

#### **8A80.30**

Status migrainosus

A debilitating migraine attack lasting for more than 72 hours

#### **8A80.3Y**

Other specified complications related to migraine

#### **8A80.4**

##### **Cyclic vomiting syndrome**

Recurrent episodic attacks, usually stereotypical in the individual patient, of vomiting and intense nausea. Attacks are associated with pallor and lethargy. There is complete resolution of symptoms between attacks.

#### **8A80.Y**

##### **Other specified migraine**

#### **8A80.Z**

##### **Migraine, unspecified**

**8A81****Tension-type headache**

A primary and highly prevalent headache disorder, in most cases episodic. Attacks of highly variable frequency and duration are characterised by mild-to-moderate headache without associated symptoms, although pericranial tenderness may be present. In a minority of cases the disorder evolves, with increasingly frequent headache and sometimes loss of episodicity.

**Exclusions:** New daily-persistent headache (8A83)

**8A81.0****Infrequent episodic tension-type headache**

Infrequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting minutes to days. The pain does not worsen with routine physical activity and is not associated with nausea, but photophobia or phonophobia may be present.

**8A81.1****Frequent episodic tension-type headache**

Frequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting minutes to days. The pain does not worsen with routine physical activity and is not associated with nausea, but photophobia or phonophobia may be present.

**8A81.2****Chronic tension-type headache**

A disorder evolving from frequent episodic tension-type headache, with daily or very frequent episodes of headache, typically bilateral, pressing or tightening in quality and of mild to moderate intensity, lasting hours to days, or unremitting. The pain does not worsen with routine physical activity, but may be associated with mild nausea, photophobia or phonophobia.

**8A81.Y****Other specified tension-type headache****8A81.Z****Tension-type headache, unspecified****8A82****Trigeminal autonomic cephalalgias**

A group of related primary headache disorders essentially characterised by unilateral headache and trigeminal autonomic activation. In most but not all of these disorders, the headache is short-lasting and very frequently recurring, but sometimes remitting for long periods.

**8A83****Other primary headache disorder**

A group of clinically heterogeneous headache disorders, believed to be primary. Although largely unrelated, they fall into four categories: headaches associated with physical exertion; headaches attributed to direct physical but innocuous stimuli; epicranial headaches; and other miscellaneous primary headache disorders.

**8A84****Secondary headache**

**Coding Note:** Code also the causing condition

**8A84.0****Acute headache associated with traumatic injury to the head**

Headache of less than three months' duration associated with traumatic injury to the head.

|                     |                                                                                                                                                                                                                                                                                                         |

**8B02****Nontraumatic subdural haemorrhage**

**Coding Note:** This entity is not part of the definition of stroke.

**Exclusions:** Traumatic subdural haemorrhage (NA07.6)

**Coded Elsewhere:** Subdural nontraumatic haemorrhage of fetus or newborn (KA82.7)

**8B03****Nontraumatic epidural haemorrhage**

**Coding Note:** This entity is not part of the definition of stroke.

**8B0Z****Intracranial haemorrhage, unspecified**

Cerebral ischaemia (8B10-8B1Z)

**Coded Elsewhere:** Neonatal cerebral ischaemia (KB00)

**8B10****Transient ischaemic attack**

Transient episode of focal neurological dysfunction caused by focal brain ischemia without acute infarction in the clinically relevant area of the brain or transient monocular visual loss due to retinal ischemia. Symptoms should resolve completely within 24 hours.

**Exclusions:** Neonatal cerebral ischaemia (KB00)  
Transient global amnesia (MB21.12)

**8B10.0****Amaurosis fugax**

A transient episode of acute visual dysfunction caused by retinal ischaemia. Symptoms should resolve completely within 24 hours.

**Coding Note:** Code also the causing condition

**8B10.Y****Other specified transient ischaemic attack****8B10.Z****Transient ischaemic attack, unspecified****8B11****Cerebral ischaemic stroke**

Acute focal neurological dysfunction caused by focal infarction at single or multiple sites of the brain. Evidence of acute infarction may come either from a) symptom duration lasting more than 24 hours, or b) neuroimaging or other technique in the clinically relevant area of the brain. The term does not include infarction of the retina.

**Coding Note:** When the cause of ischaemic stroke is known, code to the cause. When the cause of ischaemic stroke is not known, code to 8B11.5-. When the cause of stroke is not known, code to 8B20 Stroke not known if ischaemic or haemorrhagic.

**Exclusions:** sequelae of cerebral infarction (8B25.0)  
Silent cerebral infarct (8B21.0)

**8B11.50** Cerebral ischaemic stroke due to unspecified occlusion or stenosis of extracranial large artery  
This is a sudden loss of brain function due to a lack of adequate blood flow of the large extracranial arteries.

**Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

**Exclusions:** Cerebral ischaemic stroke due to embolic occlusion (8B11.2)  
Cerebral ischaemic stroke due to other known cause (8B11.4)  
Cerebral ischaemic stroke due to extracranial large artery atherosclerosis (8B11.0)

**8B11.51** Cerebral ischaemic stroke due to unspecified occlusion or stenosis of intracranial large artery  
This is a sudden loss of brain function due to a lack of adequate blood flow of the large intracranial arteries.

**Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

**Exclusions:** Cerebral ischaemic stroke due to intracranial large artery atherosclerosis (8B11.1)  
Cerebral ischaemic stroke due to embolic occlusion (8B11.2)  
Cerebral ischaemic stroke due to other known cause (8B11.4)

**8B11.5Z** Cerebral ischaemic stroke, unspecified

**Coding Note:** If an additional code is used for anatomy, the artery affected by the stroke should be selected.

**8B1Y** **Other specified cerebral ischaemia**

**8B1Z** **Cerebral ischaemia, unspecified**

**8B20** **Stroke not known if ischaemic or haemorrhagic**

Fulfills criteria for stroke in acute symptoms of focal brain injury that have lasted 24 hours or more (or led to death before 24 hours), but subtype of stroke (ischemic or haemorrhagic) has not been determined by neuroimaging or other techniques.

**Exclusions:** sequelae of stroke (8B25.4)

**8B21** **Cerebrovascular disease with no acute cerebral symptom**

Silent cerebral infarct is defined as an infarct demonstrated on neuroimaging or at autopsy that has not caused acute dysfunction of the brain (i.e. does not qualify for diagnoses of TIA or cerebral ischemic stroke). The term "silent" denotes lack of acute symptoms.

**Exclusions:** Transient ischaemic attack (8B10)  
Cerebral ischaemic stroke (8B11)  
Intracerebral haemorrhage (8B00)  
Subarachnoid haemorrhage (8B01)  
Stroke not known if ischaemic or haemorrhagic (8B20)

**8B23****Cerebrovascular abnormalities**

Cerebrovascular abnormalities in diseases that also involve other parts of the vascular system than intracranial and extracranial arteries, or other body systems than the nervous system.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Vein of Galen aneurysm (LA90.20)

Cerebral arteritis in infectious or parasitic diseases (8B22.7Y)

**8B24****Hypoxic-ischaemic encephalopathy**

Brain damage due to hypoxia-ischemia: Previous term Anoxic brain damage has been changed. The new term is now widely accepted, and better describes the pathophysiology, i.e., the combination of complete and incomplete transitory global cerebral ischemia together with a combination of anoxia and hypoxia. In a surviving patient, pure anoxic encephalopathy is very uncommon.

**Exclusions:** complicating: surgical and medical care (NE80-NE8Z)

neonatal anoxia (KB21)

Central nervous system complications of anaesthesia during pregnancy (JA67.2)

complicating: abortion or ectopic or molar pregnancy (JA00-JA0Z)

Central nervous system complications of anaesthesia during labour or delivery (JB0C.3)

Central nervous system complications of anaesthesia during the puerperium (JB43.2)

**Coded Elsewhere:** Hypoxic ischaemic encephalopathy of newborn (KB04)

**8B24.0****Anoxic-ischaemic encephalopathy****8B24.Y****Other specified hypoxic-ischaemic encephalopathy****8B24.Z****Hypoxic-ischaemic encephalopathy, unspecified****8B25****Late effects of cerebrovascular disease**

Effects of cerebrovascular disease 1 month or later after the onset of the disease. Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

**Coding Note:** Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.

Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

- 8B25.0      Late effects of cerebral ischemic stroke**  
Late effects of cerebral ischaemic stroke 1 month or later after the onset of the disease. Codes for the acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
- Coding Note:** Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.
- Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
- 8B25.1      Late effects of intracerebral haemorrhage**  
#DRAFT# This is the late effects of a non-traumatic intracranial haemorrhage 1 month or later after the onset of the disease. Codes for acute haemorrhage should be exclusively used for the acute haemorrhage and immediately related hospitalisation episodes.
- Coding Note:** Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added. Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.
- Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
- 8B25.2      Late effects of subarachnoid haemorrhage**  
Late effects of non-traumatic subarachnoid haemorrhage 1 month or later after the onset of the disease. Codes for acute haemorrhage should be exclusively used for the acute haemorrhage and immediately related hospitalisation episodes.
- Coding Note:** Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.
- Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.
- Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.
- 8B25.3      Late effects of other nontraumatic intracranial haemorrhage**  
Late effects of other non-traumatic intracranial haemorrhage 1 month or later after the onset of the disease. Codes for acute episode should be exclusively used for the acute haemorrhage and immediately related hospitalisation episodes.
- Coding Note:** Use of the code "Late effects of cerebrovascular disease" requires that there are residual (still persisting) symptoms or signs after a previous cerebrovascular event. Codes for neurological symptoms may be added.
- Code first, the specific residual condition(s) resulting from a previous cerebrovascular event.
- Codes for acute stroke should be exclusively used for the acute stroke and immediately related hospitalisation episodes.

| <b>8B40</b>   | <b>Cauda equina syndrome</b><br>#DRAFT# This is a clinical diagnosis which can be due to any condition affecting the structure and function of the lumbar and sacral nerve roots as they traverse the lower spinal canal below the end of the spinal cord. The syndrome is associated with radiological evidence of stenosis commonly due to lumbar vertebral degenerative disease.                                                                              |

| <b>8B43.0</b> | <b>Acute arterial infarction of the spinal cord</b><br>Acute arterial infarction of the spinal cord is due to occlusion of the anterior or posterior spinal arteries or their branches. Classical anterior spinal artery occlusion in the watershed zone in the lower cervical cord causes a specific cord syndrome with sparing of the posterior segment of the cord. Associated aortic atherosclerotic disease as well as dissection should not be overlooked. |
| <b>8B43.1</b> | <b>Acute venous infarction of the spinal cord</b><br>Loss of blood flow in the venous system, leading to spinal cord infarction, commonly associated with dural fistula and dural arteriovenous malformation.                                                                                                                                                                                                                                                    |

| <b>8B44.0</b>  | <b>Hereditary spastic paraplegia</b><br>Hereditary spastic paraplegias (HSP) comprise a genetically and clinically heterogeneous group of neurodegenerative disorders characterised by varying degrees of lower limb spasticity, pyramidal weakness, hyperreflexia and hypertonic bladder involvement. Clinically, HSPs can be divided into two main groups: uncomplicated (pure) and complicated (complex) forms depending on the presence of other neurological features including ataxia, peripheral neuropathy, cognitive impairment, epilepsy, amyotrophy, retinopathy, deafness, ichthyosis and extrapyramidal involvement, in addition to spastic paraparesis. Pure HSPs are characterised by slowly progressive lower extremity spasticity and weakness, often associated with hypertonic urinary disturbances, mild reduction of lower extremity vibration sense and, occasionally, of joint position sensation. Complex HSP forms are characterised by the presence of additional neurological or non-neurological features. A positive family history particularly in autosomal dominant cases is often but not always present. The diagnosis may be aided by neuroimaging and genetic testing.<br><i>Coded Elsewhere:</i> Spastic paraplegia - nephritis - deafness (LD2H.Y) |

## Motor neuron diseases or related disorders (8B60-8B6Z)

A group of disorders characterised by progressive weakness secondary to degeneration of the lower motor neurons.

### 8B60

#### **Motor neuron disease**

Motor neuron disease is a neurodegenerative disorder of undetermined etiology, characterised by degeneration of upper motor neurons (cortical Betz cells and corticospinal tract) or lower motor neurons (ventral horns of spinal cord and cranial nerve motor nuclei) or both. Features of involvement of lower motor neurons (LMN) are atrophy, weakness, fasciculations, hypotonia, decreased or absent deep tendon reflexes. Features of involvement of upper motor neurons (UMN) are spasticity, exaggerated deep tendon reflexes, and extensor plantar responses. Depending on the site of onset and the presence of UMN or LMN features or both, MND has varying patterns and distributions of signs and symptoms.

**Coded Elsewhere:** Brown-Vialetto-van Laere syndrome (LD2H.Y)

### 8B60.0

#### **Amyotrophic lateral sclerosis**

Amyotrophic lateral sclerosis (ALS) is a progressive, fatal disorder in which progressive signs of LMN and UMN degeneration are seen within one or more of the four regions: bulbar, cervical, thoracic and lumbosacral. Electrophysiological studies may be required to confirm lower motor neuron degeneration and to exclude alternative causes. Neuroimaging may be performed to exclude other causes, which might explain the clinical and electrophysiological features. Familial ALS (FALS) of autosomal dominant inheritance constitutes 5 to 10% of ALS. The clinical profile of FALS and sporadic ALS is similar. Mutations in the C9ORF72 and Cu/Zn superoxide dismutase (SOD1) genes constitute 50-60% of FALS.

### 8B60.1

#### **Progressive bulbar palsy**

Progressive bulbar palsy (PBP) is a variant of amyotrophic lateral sclerosis that initially presents with symptoms of bulbar weakness such as dysarthria and dysphagia. Symptoms may remain relatively confined to the bulbar region. PBP more commonly affects females than males. Patients typically progress to develop limb weakness and features consistent with more typical ALS at a later stage of disease.

### 8B60.2

#### **Progressive pseudobulbar palsy**

Spastic speech, difficulty in swallowing, emotional lability, brisk jaw jerk, release reflexes such as palmomental reflex due to involvement of craniobulbar tracts are the common features of progressive pseudobulbar palsy. Usually mild lower motor neuron signs observed in progressive bulbar palsy may also co-exist or may develop during the progression of the disorder.

| <b>8B60.3</b> | <p><b>Progressive muscular atrophy</b></p> <p>In progressive muscular atrophy, lower motor neuron signs in limb and trunk muscles are present without upper motor neuron involvement. Over time, some patients may progress to develop upper motor neuron signs, of which pathological evidence is common even in patients who never displayed clinical upper motor neuron signs, suggesting that progressive muscular atrophy is a form of ALS.</p> <p><b>Exclusions:</b> Fazio-Londe syndrome (8B60)</p> <p>Amyotrophic lateral sclerosis (8B60.0)</p>                                                                                              |
| <b>8B60.4</b> | <p><b>Primary lateral sclerosis</b></p> <p>Primary lateral sclerosis (PLS) is a rare motor neuron disease variant which presents with slowly progressive UMN signs, such as spastic gait, brisk deep tendon jerks, and extensor plantar responses. Onset is most commonly with spastic paraparesis, but patients typically progress to develop upper limb and bulbar involvement. The characteristic feature of PLS is the complete absence of involvement of lower motor neuron involvement. When LMN signs develop during the course of the disease, the diagnosis will change to ALS, and they are considered a spectrum of the same disorder.</p> |
| <b>8B60.5</b> | <p><b>Amyotrophic lateral sclerosis-Plus</b></p> <p>This category represents a group of disorders with motor symptoms of ALS and superimposed features of dysfunction of other neurological systems, such as extrapyramidal, cerebellar or cognitive dysfunction.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>8B60.6</b> | <p><b>Monomelic amyotrophy</b></p> <p>Atrophy and weakness restricted to one upper or lower limb, onset in the second or third decade, male predominance, and sporadic occurrence are characteristic features of MMA. Other typical features include: insidious onset of lower motor neuron signs due to anterior horn cell involvement, absence of upper motor neuron signs, slow progression followed by stabilization within a few years,, and a benign symptomatic disease course. MMA is particularly prevalent in Asia although it is encountered worldwide.</p>                                                                                |
| <b>8B60.7</b> | <p><b>Madras type motor neuron disease</b></p> <p>#DRAFT# The characteristic features of Madras type motor neuron disease are sporadic occurrence; young onset, in the second decade of life; asymmetric weakness and wasting of the limbs; fasciculations; bilateral facial palsy; bulbar paralysis; pyramidal signs; sensorineural hearing loss; and a relatively benign disease course. The majority of cases are reported from South India and very few cases have been reported from elsewhere in India or from other countries.</p>                                                                                                             |

**8B61****Spinal muscular atrophy**

Spinal muscular atrophy (SMA) is a progressive disorder with loss of anterior horn cells leading to muscle weakness and wasting. The weakness is typically symmetrical. Typically, upper motor neuron signs are absent and there is no sensory deficit. Feeding and swallowing can be affected, and involvement of respiratory muscles may occur. SMA is an autosomal recessive disorder linked to chromosome 5q13 and the disorder is caused by deletion or mutation of SMN 1 (spinal motor neuron 1) gene. The four types of SMA I, II, III and IV are categorised based on the age of onset of the disease and the ability to achieve motor milestones.

**8B61.0 Infantile spinal muscular atrophy, Type I**

In SMA type 1, onset of weakness may be prenatal (decreased fetal movements toward the end of pregnancy) or within the first six months of life. Infants demonstrate a characteristic frog position with the thighs externally rotated and abducted and the knees flexed (floppy infant). Bulbar weakness causes feeding difficulty. Children are never able to sit without support, and the average survival is 9 months; survival beyond 2 years is rare.

**8B61.1 Late infantile spinal muscular atrophy, Type II**

In SMA type 2, muscle weakness is seen between the ages of 6 to 18 months. The child can sit unsupported, but cannot stand or walk independently. Death usually occurs between 2 years of age and young adulthood.

**8B61.2 Juvenile form spinal muscular dystrophy, Type III**

In SMA type 3, weakness of muscles is seen after 18 months of age. The child is able to sit and stand independently. There is a limb girdle-type of distribution of weakness causing waddling gait, falls, and difficulty with running. The ability to walk may be lost, requiring a wheelchair as the disease progresses. The life expectancy may be normal.

**8B61.3 Adult onset spinal muscular atrophy, Type IV**

In SMA type 4 weakness, most commonly develops after 35 years of age (less commonly between 18 to 35 years old). Weakness of proximal muscles is more prominent in the legs than in the arms. Insidious onset and very slow progression are the characteristic features, and life span is normal.

**8B61.4 Localised spinal muscular atrophy**

This category comprises a group of disorders with a varied pattern of weakness and autosomal dominant or X-linked recessive inheritance with specific genetic profiles.

**8B61.Y Other specified spinal muscular atrophy****8B61.Z Spinal muscular atrophy, unspecified**

**8B62**

**Post polio progressive muscular atrophy**

The diagnostic criteria for Post-polio progressive muscular atrophy (PPMA) are: a credible history of poliomyelitis with partial recovery of function, a minimum 10-year period of stabilization, and the subsequent development of progressive muscle weakness. Symptoms of weakness, atrophy, and fatigue of previously affected muscles may be seen. These symptoms may also be newly noted in muscles that were apparently unaffected by the poliomyelitis episode. Muscle cramps and fasciculations may accompany the new weakness.

**Inclusions:** Post polio myelitic syndrome

**8B6Y**

**Other specified motor neuron diseases or related disorders**

**8B6Z**

**Motor neuron diseases or related disorders, unspecified**

## Disorders of nerve root, plexus or peripheral nerves (8B80-8C4Z)

- Exclusions:**
- neuritis NOS (FB56)
  - Injury of cranial nerves (NA04)
  - Injury of nerves or spinal cord at neck level (NA30-NA4Z)
  - Injury of nerves or lumbar spinal cord at abdomen, lower back or pelvis level (NB60-NB7Z)
  - Injury of nerves at shoulder or upper arm level (NC14)
  - Injury of nerves at forearm level (NC34)
  - Injury of nerves at wrist or hand level (NC55)
  - Injury of nerves at hip or thigh level (NC74)
  - Injury of nerves at lower leg level (NC94)
  - Injury of nerves at ankle or foot level (ND15)

- Coded Elsewhere:**
- Neuromyotonia (8C71.4)
  - Disorder of the optic nerve (9C40)
  - Ocular motor nerve palsies (9C81)
  - Infections of the peripheral nerves (1D0Y)

## Disorders of cranial nerves (8B80-8B8Z)

#DRAFT# This is a group of disorders of the cranial nerves, the twelve nerves that emerge from the brain and brainstem.

- Exclusions:**
- Disorders of acoustic nerve (AB72)
  - Disorder of the optic nerve (9C40)

- Coded Elsewhere:**
- Acute neuropathy of cranial nerve due to zoster (1E91.4)
  - Ocular motor nerve palsies (9C81)

### 8B80

#### Disorders of olfactory nerve

#DRAFT# The olfactory nerve is a pure sensory nerve that mediates the sense of smell; the first order sensory neurons of the olfactory system reside in the nasal cavity, travel via unmyelinated central processes across the cribriform plate of the ethmoid bone to synapse on second-order sensory neurons that make up the olfactory bulb; impairment of the olfactory nerve result from head trauma; tumours, particularly an olfactory groove meningioma; tobacco smoking and the common cold. Symptoms of olfactory nerve involvement are loss or reduction of the sense of smell (anosmia, hyposmia) or rarely, increased olfactory acuity (hyperosmia) or distortion of smell (parosmia).

- Inclusions:**
- Disorder of 1st cranial nerve

- Exclusions:**
- Idiopathic anosmia (MB41.0)
  - Idiopathic parosmia (MB41.1)

- Coded Elsewhere:**
- Injury of olfactory nerve (NA04.0)

**8B81****Disorders of vestibulocochlear nerve**

**Coded Elsewhere:** Vestibular neuritis (AB30.0)

Meniere disease (AB31.0)

Acquired hearing impairment (AB51)

Acute vestibular syndrome (AB30)

Episodic vestibular syndrome (AB31)

Chronic vestibular syndrome (AB32)

**8B81.0****Brainstem lesion****8B81.Y****Other specified disorders of vestibulocochlear nerve****8B81.Z****Disorders of vestibulocochlear nerve, unspecified****8B82****Disorders of trigeminal nerve**

The trigeminal nerve is a mixed nerve with three divisions, ophthalmic, maxillary and mandibular divisions, that provides sensory innervation to the face and mucous membrane of the oral and nasal cavities and motor innervations to the muscle of mastication, tensor tympani, tensor veli palatine, mylohyoid and anterior belly of the digastric muscle. The trigeminal nuclear complex extends throughout the brainstem, hence it is susceptible to many pathologic processes including demyelination, ischemia, haemorrhage, infectious and non-infectious inflammation and neoplasm leading to symptoms of trigeminal nerve involvement. Compression of the sensory nerve root outside the brain stem by a vascular loop leads to trigeminal neuralgia. Symptoms and signs depend on the site of the lesion. In general, a trigeminal nerve disorder is associated with hemisensory facial loss, deviation of the jaw to paralysed side on opening of the mouth, and loss of the corneal reflex.

**Coded Elsewhere:** Atypical facial pain (8A85)

**8B82.0****Trigeminal neuralgia**

Trigeminal neuralgia is a manifestation of orofacial neuropathic pain restricted to one or more divisions of the trigeminal nerve. The pain is recurrent, abrupt in onset and termination, triggered by innocuous stimuli and typically compared to an electric shock or described as shooting or stabbing. Some patients experience continuous pain between these painful paroxysms.

**8B82.Z****Disorders of trigeminal nerve, unspecified****8B83****Disorders of spinal accessory nerve**

**Coded Elsewhere:** Injury of accessory nerve (NA04.A)

Lesion in jugular foramen (8B87)

**8B84****Disorders of hypoglossal nerve**

#DRAFT# The hypoglossal nerve is a pure motor nerve supplying the somatic musculature of tongue; its cell bodies are located in hypoglossal nucleus in the medulla. Hypoglossal nerve fibres emerge as a series of rootlets, which converge to form hypoglossal nerve. All the intrinsic muscles of the tongue (longitudinal, transverse and vertical) and extrinsic muscles of tongue (hyoglossus, styloglossus, genioglossus) are innervated by this nerve. Lesions of the nerve lead to atrophy, furrowing, fasciculations and weakness of the ipsilateral half of the tongue. The tongue deviates to the side of lesion due to unopposed action of contralateral genioglossus; dysarthria and dysphasia are minimal but difficulty in manipulating food in the mouth is often evident. Bilateral involvement results in diffuse atrophy, weakness and fasciculations of the tongue; the tongue cannot be protruded voluntarily and there is difficulty in articulation.

**8B85****Disorders of multiple cranial nerves**

This is a group of disorders of multiple cranial nerves, the twelve nerves that emerge from the brain and brainstem.

**Inclusions:** Cranial polyneuritis

**8B86****Disorders of vagus nerve**

#DRAFT# This nerve has an extensive sensory and motor distribution and important autonomic functions; it innervates the muscles of the larynx and pharynx, abdominal and thoracic viscera (autonomic effects), and carries sensations from pharynx, larynx, aortic arch and body, abdominal and thoracic viscera and taste sensation from pharynx. The nerve can be affected by chest tumours and injury during surgery. Clinical features of impairment of the vague nerve include hoarseness of voice; dysphagia; ipsilateral loss of sensation of the pharynx, larynx, and external ear; and paralysis of the uvula with deviation of uvula to the opposite side.

**Exclusions:** Paralysis of vocal cords or larynx (CA0H.0)

**Coded Elsewhere:** Lesion in jugular foramen (8B87)

**8B87****Disorders of glossopharyngeal nerve**

#DRAFT# The glossopharyngeal nerve contains motor, sensory, gustatory and parasympathetic fibres and emerges from the medulla along with the vagus and hypoglossal nerves, and exits the skull via jugular foramen. It innervates the stylopharyngeus muscle (elevator of pharynx), carries pain, temperature and touch sensation from the posterior one-third of the tongue and pharynx, Eustachian tube, and carries chemo- and baroreceptive related impulses from the carotid sinus and carotid body. Somatic sensory fibres supply the skin of the external ear, and special sensory fibres supply the taste buds of the posterior one-third of tongue. Lesions of the glossopharyngeal nerve rarely occur in isolation but are usually seen along with involvement of vagus and spinal accessory nerves, such as in tumours of the glomus jugulare. Injury, inflammation, and internal carotid dissection also affect the glossopharyngeal nerve, leading to hoarseness of voice, dysphagia, and loss of the normal gag reflex.

**Inclusions:** Disorders of 9th cranial nerve

**8B88****Disorders of facial nerve**

**8B88.0 Bell palsy**

#DRAFT# Idiopathic acute facial nerve palsy is also known as Bell's palsy. Facial nerve dysfunction at the stylomastoid foramen leads to ipsilateral upper and lower facial weakness, manifested by an asymmetric smile, poor eyebrow elevation, decreased forehead wrinkling, widened palpebral fissure, weak eye closure, deviation of eye upward and laterally with attempted eye closure (Bell's phenomenon) and flattening of the nasolabial fold. Sagging of the lower eyelid causes tears to spill over the cheek, and saliva may also dribble from the corner of mouth. Although there may be subjective feelings of heaviness or numbness in the face, sensory loss is rarely demonstrable and taste is intact. If the lesion is in the middle ear portion proximal to the stylomastoid foramen, taste is lost over the anterior two-thirds of the tongue on same side. If the nerve to the stapedius is interrupted, there is hyperacusis (increased sensitivity to loud sounds).

**8B88.1 Facial myokymia**

#DRAFT# This is an involuntary twitching or wave-like movement of facial muscles.

**8B88.2 Hemifacial spasm**

Hemifacial spasm (HFS) is a movement disorder most commonly caused by vascular compression of the VII cranial nerve at its root exit zone from the brainstem. It manifests as involuntary contractions and twitching on ipsilateral side of the face.

**8B88.3 Facial neuritis****8B88.Y Other specified disorders of facial nerve****8B88.Z Disorders of facial nerve, unspecified****8B8Y Other specified disorders of cranial nerves****8B8Z Disorders of cranial nerves, unspecified**

Nerve root or plexus disorders (8B90-8B9Z)

#DRAFT# These are conditions of the root and/or plexus portions of nerves. Plexus portions are network-like.

**Exclusions:**           intervertebral disc disorders (FA80-FA8Z)

                          Spondylolysis (FA81)

**8B90 Nerve root and plexus compressions**

**Coding Note:**   Code also the causing condition

**8B91****Brachial plexus disorders**

#DRAFT# The brachial plexus is formed by ventral rami of five spinal nerves (C5-T1), which have motor, sensory and preganglionic sympathetic fibres innervating the upper limb. These five rami join to form three trunks (upper-C5-C6; middle-C7; lower-C8-T1) which again divide into six divisions to become three cords (lateral, medial and posterior). The plexus is vulnerable to trauma at various levels and can be affected by a variety of diseases because of its close proximity to lymph nodes, blood vessels and lung parenchyma; diabetes mellitus and vasculitis can also cause brachial plexus dysfunction. Some cases are considered as an idiopathic brachial plexopathy. Clinical features depend on whether the entire plexus or a portion of it is involved. In panplexopathy, the arm hangs lifelessly by the side, the limb is flaccid and areflexic with complete sensory loss below a line extending from the shoulder diagonally downward and medially to the middle of upper arm.

In lesions of the upper trunk, the arm hangs at the side, internally rotated at the shoulder, with the elbow extended and the forearm pronated in a “waiter’s tip” posture. The biceps and brachioradialis reflexes are absent and sensory loss is found over the lateral aspect of the arm, forearm and thumb.

In lesions of the lower trunk, there is weakness of the intrinsic hand muscles, the finger flexion reflex is diminished or absent, and there is sensory loss over the two medial fingers as well as the medial aspect of forearm and hand.

**8B91.0****Neuralgic shoulder amyotrophy**

Parsonage-Turner syndrome is a rare condition of unknown etiology that presents with a characteristic pattern of sudden and acute pain across the top of the shoulder, lasting a few hours to a fortnight, followed by flaccid paralysis of some muscles of the shoulder girdle.

**8B91.1****Thoracic outlet syndrome due to cervical rib****8B91.Y****Other specified brachial plexus disorders****8B91.Z****Brachial plexus disorders, unspecified****8B92****Lumbosacral plexus disorders**

#DRAFT# The lumbar plexus is formed by the anterior primary rami of lumbar spinal nerves L1 to L4 and the sacral plexus is derived from the anterior primary rami of spinal nerves L4, L5, S1, S2, and S3. The lumbar plexus communicates with the sacral plexus via the anterior division of L4. The lumbosacral plexus can be affected by a variety of diseases like direct invasions by neoplasms (cervix, prostate, bladder, colorectum, kidney, ovary) or dysfunction due to other causes such as diabetes mellitus, vasculitis and radiation injury. It can also be idiopathic.

In lumbar plexus lesions, there is weakness of hip flexion, knee extension and hip adduction. Sensation may be lost in the inguinal region, over the genitalia, the lateral, anterior and medial thigh and on the medial aspect of the lower leg; the knee jerk may be decreased or absent.

In sacral plexus lesions, there is weakness of hip extensors and abductors, knee flexors, ankle plantar flexors and dorsiflexors; sensory loss is found over the posterior aspect of the thigh, the anterolateral and posterior aspect of the leg below the knee, and the dorsolateral and plantar surface of the foot. The ankle jerk is reduced or absent.

**8B92.0**            **Post radiation lumbosacral plexopathy**

**8B92.1**            **Vasculitic lumbosacral plexopathy**

**8B92.2**            **Diabetic lumbosacral plexopathy**

**Coding Note:**    Always assign an additional code for diabetes mellitus

**8B92.3**            **Lumbosacral radiculoplexopathy**

**8B92.Y**            **Other specified lumbosacral plexus disorders**

**8B92.Z**            **Lumbosacral plexus disorders, unspecified**

**8B93**            **Radiculopathy**

**Exclusions:**            Neuritis (FB56)  
                                 Intervertebral disc degeneration (FA80)

**8B93.0**            **Radiculopathy due to compression**

**8B93.1**            **Radiculopathy due to metabolic disorders**

**8B93.2**            **Radiculopathy due to electric shock or lightning**

**8B93.3**            **Radiculopathy due to radiation injury**

**8B93.4**            **Radiculopathy due to nutritional deficiencies**

**8B93.5**            **Radiculopathy due to toxicity**

**8B93.6**            **Radiculopathy due to intervertebral disc disorders**

**8B93.7**            **Radiculopathy due to neoplastic disease**

**8B93.8**            **Radiculopathy due to spondylosis**

**8B93.Y**            **Other specified radiculopathy**

**8B93.Z**            **Radiculopathy, unspecified**

**8B94**            **Diabetic radiculoplexoneuropathy**

Diabetic radiculoplexoneuropathy is a rare, but established complication of a focal neuropathy occurring in patients with diabetes type 2. Etiologically inflammatory changes of microvasculitis are assumed. It is independent on the stage of diabetes and often occurs usually in association of weight loss, not before the 4th or 5th decade. It presents with acute severe pain, and predominant motor involvement of the lumbar plexus often asymmetric and usually unilateral. Muscle atrophy occurs early. It is self limiting, but disability may persist.

Always assign an additional code for the type of diabetes mellitus.

**Coding Note:**    Code also the causing condition

**8B95**            **Secondary brachial plexus lesion due to certain specified disorders**

**Coding Note:**    Code also the causing condition

**8B9Y**            **Other specified nerve root or plexus disorders**

**8B9Z****Nerve root or plexus disorders, unspecified**

Polyneuropathy (8C00-8C0Z)

**8C00****Idiopathic progressive neuropathy****8C01****Inflammatory polyneuropathy**

Acquired inflammatory peripheral neuropathies are of a presumed immune etiology and are classified on the basis of their clinical course: acute inflammatory demyelinating polyneuropathy (AIDP or Guillain-Barré syndrome) with the motor deficit reaching a maximal level by 28 days, and chronic inflammatory demyelinating polyneuropathy (CIDP) which has a slowly progressive course of two or more months or a relapsing remitting course. There are many variants of AIDP and CIDP.

**8C01.0****Acute inflammatory demyelinating polyneuropathy**

Progressive weakness of the limbs over a few days to 28 days, symmetrical deficit, areflexia, absent or mild sensory disturbance, elevated cerebrospinal fluid protein, and slowing of nerve conduction velocities are the cardinal features. The disorder may be preceded by upper respiratory or gastrointestinal infection or immunization 1 to 4 weeks prior to onset of the illness. Bifacial palsy may be present.

**Inclusions:** Acute Inflammatory Demyelinating Polyradiculoneuropathy

**8C01.1****Post vaccinal neuropathy****8C01.2****Subacute inflammatory demyelinating polyneuropathy**

Subacute inflammatory demyelinating polyneuropathy (SIDP) is a subacute progressive symmetric sensorial and/or motor disorder characterised by muscular weakness with impaired sensation, absent or diminished tendon reflexes and elevated cerebrospinal fluid (CSF) proteins. SIDP is an intermediate form between Guillain-Barré syndrome (GBS) and chronic inflammatory demyelinating polyneuropathy (CIDP).

**8C01.3****Chronic inflammatory demyelinating polyneuropathy**

Chronic inflammatory demyelinating polyneuropathy is a chronic monophasic, progressive or relapsing symmetric sensorimotor disorder characterised by progressive muscular weakness with impaired sensation, absent or diminished tendon reflexes and elevated cerebrospinal fluid proteins.

**8C01.Y****Other specified inflammatory polyneuropathy****8C01.Z****Inflammatory polyneuropathy, unspecified****8C03****Other secondary polyneuropathy**

**Coding Note:** Code also the causing condition

**8C03.0****Diabetic polyneuropathy**

**Coding Note:** Always assign an additional code for diabetes mellitus.

**Coded Elsewhere:** Diabetic foot ulcer (BD54)

|                     | <b>Exclusions:</b> Injury of ulnar nerve at upper arm level (NC14.0)                                                                                                                                                    |
|                     | Injury of ulnar nerve at forearm level (NC34.0)                                                                                                                                                                         |
|                     | Injury of ulnar nerve at wrist or hand level (NC55.0)                                                                                                                                                                   |

**8C10.2 Lesion of radial nerve**

**Coding Note:** Code also the causing condition

**Exclusions:** Injury of radial nerve at upper arm level (NC14.2)  
Injury of radial nerve at forearm level (NC34.2)  
Injury of radial nerve at wrist or hand level (NC55.2)

**8C10.Y Other specified mononeuropathies of upper limb**

**Coding Note:** Code also the causing condition

**8C10.Z Mononeuropathies of upper limb, unspecified**

**Coding Note:** Code also the causing condition

**8C11 Mononeuropathies of lower limb**

Damage to a single nerve or nerve group of the lower limb (not including central nervous structures such as the brain, brainstem or spinal cord), resulting in a loss of movement, sensation and/or autonomic function.

**Coding Note:** Code also the causing condition

**Inclusions:** Mononeuritis of lower limb

**Exclusions:** current traumatic nerve disorder - see nerve injury by body region (Chapter 22)

**8C11.0 Lesion of sciatic nerve**

Disease or damage involving the SCIATIC NERVE, which divides into the PERONEAL NERVE and TIBIAL NERVE (see also PERONEAL NEUROPATHIES and TIBIAL NEUROPATHY). Clinical manifestations may include SCIATICA or pain localised to the hip, PARESIS or PARALYSIS of posterior thigh muscles and muscles innervated by the peroneal and tibial nerves, and sensory loss involving the lateral and posterior thigh, posterior and lateral leg, and sole of the foot. The sciatic nerve may be affected by trauma; ISCHEMIA; COLLAGEN DISEASES; and other conditions.

**Coding Note:** Code also the causing condition

**Exclusions:** sciatica attributed to intervertebral disc disorder (FA80)  
sciatica NOS (ME84.3)  
Injury of sciatic nerve at hip or thigh level (NC74.0)

**8C11.00 Sciatic nerve piriformis syndrome**

**8C11.0Y Other specified lesion of sciatic nerve**

**Coding Note:** Code also the causing condition

**8C11.0Z Lesion of sciatic nerve, unspecified**

**Coding Note:** Code also the causing condition

|                     |                                                                                                                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8C11.1</b>       | <b>Meralgia paraesthetica</b><br>#DRAFT# This is a disorder characterised by tingling, numbness, and burning pain in the outer side of the thigh. It is caused by compression of the lateral femoral cutaneous nerve, a sensory nerve to the skin, as it exits the pelvis. |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                            |
| <b>8C11.2</b>       | <b>Lesion of femoral nerve</b>                                                                                                                                                                                                                                             |

## Diseases of neuromuscular junction or muscle (8C60-8D0Z)

Diseases resulting from destruction or malfunction of the neuromuscular junction, a chemical synapse formed between the end of the motor nerve terminal and the voluntary muscle. Pathology can occur at the presynaptic or postsynaptic membrane and leads to dysfunction of neuromuscular transmission. Common diseases of this category include Myasthenia Gravis and Lambert Eaton Myasthenic Syndrome.

### Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Myasthenia gravis is the most common autoimmune disease affecting the neuromuscular junction and is characterised by painless fatigable muscle weakness. It is caused by autoantibodies against neuromuscular junction proteins, either the nicotinic acetylcholine receptor (AChR) or the muscle specific tyrosine kinase (MuSK). Mutations in neuromuscular junction proteins cause congenital myasthenic syndromes. Other antibodies mediated conditions affecting the neuromuscular junction, including Lambert Eaton myasthenic syndrome and neuromyotonia.

**Coded Elsewhere:** Botulism (1A11)

Neuromuscular junction disorders due to toxicity (NE61)

#### 8C60

#### Myasthenia gravis

Myasthenia gravis is the most common acquired auto-antibody mediated neuromuscular transmission disorder. Prevalence is 1–2 per 10,000 persons. Fluctuating weakness increasing with repeated activity and improving after a period of rest is the hallmark. Myasthenia Gravis with antibodies directed against postsynaptic proteins, usually the nicotinic acetylcholine receptor are the most prevalent. Other types are Myasthenia Gravis associated with muscle-specific kinase antibodies and MG with unknown autoantibodies (seronegative) Myasthenia Gravis.

- There are three groups:
1. Purely ocular Myasthenia Gravis
  2. Early-onset (<40-50 years) generalised Myasthenia Gravis
  3. Late-onset generalised MG.

In about 15%, the disease can be classified as paraneoplastic, usually associated with a thymoma.

**Coded Elsewhere:** Transient neonatal myasthenia gravis (KB08.0)

#### 8C60.0

#### Drug-induced myasthenia gravis

Some drugs can have clear effects on Myasthenia Gravis, including Neuromuscular junction blockers, antibiotics, prednisone, chloroquine, D-penicillamine, interferons, and others. In rapid-onset drug-induced Myasthenia Gravis, myasthenic signs develop within days which rapidly disappear after drug withdrawal. Anti-Acetylcholinesterase antibodies are absent. This disorder may unmask a pre-existing neuromuscular transmission disorder or may exacerbate pre-existing Myasthenia Gravis, i.e. subclinical Myasthenia Gravis becomes manifest after drug treatment, or known MG becomes more severe. Certain drugs are linked with aggravation of Myasthenia Gravis, including pain management medications, tricyclic antidepressants and some antiepileptic medications, and should be used with caution.

#### 8C60.Y

#### Other specified myasthenia gravis

**8C60.Z**      **Myasthenia gravis, unspecified**

**8C61**      **Congenital myasthenic syndromes**

Congenital myasthenic syndrome (CMS) is a heterogeneous group of genetically determined diseases. There are four well-defined categories: Congenital myasthenic syndrome with presynaptic defect, Synaptic basal lamina-associated CMS, Congenital myasthenia with postsynaptic defect, CMS with glycosylation deficiency, and the remaining category is that of unidentified CMS.

**8C62**      **Lambert-Eaton syndrome**

Lambert-Eaton myasthenic syndrome, 20 times as rare as acetylcholine receptor positive myasthenia gravis with a prevalence of 3.42 per million, is an immune-mediated disease of the neuromuscular junction. Clinically the disease is characterised by proximal weakness of the legs. In most patients, the weakness extends to other muscles including the oculobulbar ones. Autonomic symptoms (dry mouth, erectile dysfunction, constipation) are frequent. Tendon reflexes are reduced. Repetitive nerve stimulation shows low compound muscle action potentials, decrement > 10% at low frequency and increment > 100% after maximum voluntary contraction at high frequency.

**8C6Y**      **Other specified myasthenia gravis and neuromuscular junction disorders**

**8C6Z**      **Unspecified myasthenia gravis or neuromuscular junction disorders**

Primary disorders of muscles (8C70-8C7Z)

Disorders in which the primary symptom of muscle weakness is secondary to a specific dysfunction of a muscle fiber.

**Exclusions:**      Metabolic disorders (5C50-5D2Z)  
                         Arthrogryposis multiplex congenita (LD26.41)

**Coded Elsewhere:**      Idiopathic rhabdomyolysis (FB32.20)  
                         Idiopathic inflammatory myopathy (4A41)

**8C70**      **Muscular dystrophy**

Progressive, hereditary skeletal muscle diseases characterised by muscle weakness, wasting, defects in muscle proteins, necrosis of muscle tissue and replacement of muscle tissue with connective and fatty tissue.

**Coded Elsewhere:**      Muscular dystrophy affecting extraocular muscle (9C82.1)  
                         Barth syndrome (5C50.E0)  
                         Epidermolysis bullosa simplex with muscular dystrophy (EC30)

**8C70.0**      **Becker muscular dystrophy**

#DRAFT# Becker muscular dystrophy is a myotonic disorder that involves slowly worsening muscle weakness of the legs and pelvis. Symptoms include muscle weakness of the lower body, breathing problems, learning disabilities, fatigue and loss of balance and coordination.

- 8C70.1      Duchenne muscular dystrophy**  
 Duchenne muscular dystrophy (DMD) is a severe X-linked myopathy caused by mutation in the dystrophin gene with symptoms appearing before the age of 6 with a rapid disease progression. Symptoms may include fatigue, learning difficulties (the IQ can be below 75), Muscle weakness, problems with motor skills, frequent falls and progressive difficulty walking.
- 8C70.2      Emery-Dreifuss muscular dystrophy**  
 Emery-Dreifuss muscular dystrophy (EDMD) is a muscle disease characterised by muscular weakness and atrophy, with early contractures of the tendons and cardiac involvement (arrhythmias, cardiomyopathy).
- 8C70.3      Facioscapulohumeral muscular dystrophy**  
 Facioscapulohumeral muscular dystrophy (FSHD) is an autosomal dominantly inherited muscle disease characterised by progressive muscle weakness with initial focal involvement of the facial, shoulder and arm muscles.
- 8C70.4      Limb-girdle muscular dystrophy**  
 Limb-girdle muscular dystrophy (LGMD) constitutes a group of genetically determined, progressive disorders of muscles, in which the pelvic or shoulder girdle musculature is predominantly or primarily involved. It may be inherited in an autosomal recessive or dominant fashion.
- 8C70.40      Dominant limb-girdle muscular dystrophy**  
 The Limb Girdle Muscular Dystrophies (LGMD) are a group of genetic disorders characterised predominantly by progressive wasting and weakness of proximal limb girdle muscles, including pelvic, shoulder, upper arm and thigh muscles. The onset symptoms usually vary from early childhood to late adulthood, and the progression rate and distribution of weakness and wasting also varies considerably among individuals and genetic subtypes. There are currently 8 autosomal dominant LGMDs (LGMD1), linked to specific gene mutations. Dominant LGMDs are often allelic with other clinical disorders, including the myofibrillar myopathies or dilated cardiomyopathy.
- Exclusions:**      Secondary myopathies (8C80-8C8Z)  
                             Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

**8C71.0****Myotonic dystrophy**

Myotonic dystrophy is a group of inherited muscular disorders. It is the most common form of muscular dystrophy that begins in adulthood. Myotonic dystrophy is characterised by progressive muscle wasting and weakness, and prolonged muscle contractions (myotonia) that are not able to relax after use. Other signs and symptoms of myotonic dystrophy include slurred speech or temporary locking of their jaw, cataracts and cardiac conduction defects. In affected men, hormonal changes may lead to early balding and infertility. The clinical severity varies widely among affected patients, even among members of the same family.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

**Coded Elsewhere:** Myotonic cataract (9B10.2Y)

**8C71.1****Chondrodystrophic myotonia**

Chondrodystrophic myotonia (Schwartz-Jampel syndrome) is a congenital myotonic syndrome characterised by myotonia that results in a characteristic facies with blepharophimosis and a puckered facial appearance, and osteoarticular abnormalities leading to limited joint mobility.

**8C71.2****Myotonia congenita**

Thomsen and Becker disease are myotonic disorders characterised by slow muscle relaxation associated with hyperexcitation of the muscle fibres occurring within the first few months after birth. The myotonia is unusual in that it is relieved by exercise (warm-up effect). Autosomal dominant myotonia congenita (Thomsen disease) is a non-dystrophic muscle disorder caused by mutation in the gene encoding skeletal muscle chloride channel-1 (CLCN1). It is clinically characterised by muscle stiffness and an inability of the muscle to relax after voluntary contraction. Autosomal recessive myotonia congenita (Becker disease) is caused by mutation in the gene encoding skeletal muscle chloride channel-1 (CLCN1). It is a non-dystrophic skeletal muscle disorder characterised by muscle stiffness and an inability of the muscle to relax after voluntary contraction. Most patients have symptom onset in the legs, which later progresses to the arms, neck, and facial muscles. Many patients show marked hypertrophy of the lower limb muscles. Transient muscle weakness is a characteristic feature.

**8C71.3****Drug-induced myotonia**

Drug-induced myotonia refers to the myotonia-inducing effects of certain drugs. Hypocholesterolaemic agents may induce myotonia by altering the sterol composition of the muscle cell membrane, while other drugs including beta-adrenergic blockers and agonists, succinylcholine and diuretics may exacerbate or unmask pre-existing myotonia.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>8C73</b>         | <p><b>Mitochondrial myopathies</b></p> <p>Mitochondrial myopathies are heterogeneous group of disorders caused by dysfunction of mitochondrial oxidative phosphorylation and can be classified according to the associated biochemical, genetic defects (in the mitochondrial DNA or in nuclear encoded proteins) or clinical phenotype. Exclude: defects of mitochondrial respiratory chain, Kearns-Sayre syndrome, myoclonic epilepsy with ragged red fibres (MERRF)</p> <p><b>Coded Elsewhere:</b> Leigh syndrome (5C53.24)</p> <p style="padding-left: 100px;">Progressive external ophthalmoplegia (9C82.0)</p>                                                                                                                                                                                                                                      |
| <b>8C73.0</b>       | <p><b>Autosomal recessive cardiomyopathy or ophthalmoplegia</b></p> <p>Autosomal recessive cardiomyopathy and ophthalmoplegia is a childhood-onset disease characterised by progressive external ophthalmoplegia, mild facial and proximal limb weakness, and severe cardiomyopathy. Muscle biopsies show ragged-red and cytochrome C oxidase-negative fibres; the activities of several complexes in the electron-transport chain are decreased. The combination of progressive external ophthalmoplegia, cardiomyopathy, and multiple mtDNA deletions is thought to be due to a defect of communication between the nuclear and mitochondrial genomes.</p> <p><b>Exclusions:</b>           Secondary myopathies (8C80-8C8Z)</p> <p style="padding-left: 100px;">Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)</p> |
| <b>8C73.1</b>       | <p><b>Neuropathy, ataxia, and retinitis pigmentosa</b></p> <p>Neuropathy, Ataxia, and Retinitis Pigmentosa (NARP) syndrome is a clinically heterogeneous oxidative phosphorylation disorder often characterised by a combination of sensory-motor neuropathy, cerebellar ataxia, and night blindness.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>8C75</b>    | <b>Distal myopathies</b><br><p>Distal myopathies are heterogeneous group of myopathies characterised clinically by progressive weakness and atrophy starting in distal muscles and progressing to proximal ones, and histologically by nonspecific myopathic features on muscle biopsy.</p>                                                                                                                                       |

**8C76****Myofibrillar myopathy**

Myofibrillar myopathies are a heterogeneous group of disorders, characterised by the pathologic finding of myofibrillar disruption on electron microscope with a spectrum of histological abnormalities including excessive desmin accumulation in muscle fibres.

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Secondary myopathies (8C80-8C8Z)

**8C77****Ocular myopathy**

Slowly progressive weakness of ocular muscles, usually characterised by decreased mobility of the eye and drooping of the upper lid. The disorder may be unilateral or bilateral, and may be caused by central or peripheral nervous system lesion or by a neuromuscular disease.

**Exclusions:** Ocular myopathy with mitochondrial abnormalities (9C82.0)  
oculopharyngeal muscular dystrophy (9C82.1)  
Ocular muscular dystrophy (9C82.1)

**8C78****Malignant hyperthermia or hyperpyrexia**

Malignant hyperthermia is a pharmacogenetic disorder of skeletal muscle that presents as a hypermetabolic response to potent volatile anaesthetic gases such as halothane, sevoflurane, desflurane and the depolarizing muscle relaxant succinylcholine, and rarely in humans, to stresses such as vigorous exercise and heat. May be caused by a mutation in the Ryanodine Receptor 1 gene.

**8C7Y****Other specified primary disorders of muscles****8C7Z****Primary disorders of muscles, unspecified**

Secondary myopathies (8C80-8C8Z)

This is a group of conditions in which the muscle fibres are dysfunctional, resulting in muscle weakness. The myopathy is caused by an underlying disorder.

**Exclusions:** Arthrogryposis multiplex congenita (LD26.41)  
Ischaemic infarction of muscle (FB32.2)

**Coded Elsewhere:** Alcoholic myopathy (8D44.1)  
Myopathy due to toxicity (8D43.3)

**8C80****Drug-induced myopathy**

Myopathy caused by drugs that ranges from mild myalgias with or without mild weakness to chronic myopathy with severe weakness, to massive rhabdomyolysis with acute renal failure. It could be due to several different mechanisms including direct myotoxicity, immune mediated and indirect muscle damage through drug-induced coma, drug-induced hypokalaemia, drug-induced hyperkinetic states or dystonic states.

**8C81****Autoimmune myopathy**

Autoimmune myopathy is a subgroup of idiopathic inflammatory myopathies, which, despite diverse causes, have the common histopathological features of myocyte necrosis without significant inflammation. Patients present with a subacute severe symmetrical proximal myopathy, associated with a markedly elevated creatine kinase level. These are most likely immune-mediated, as they respond to immunotherapy. It is often accompanied by statin therapy, connective tissue diseases, cancer, and autoantibodies specific for signal recognition particle (SRP) or 3-hydroxy-3-methylglutaryl-coenzyme A reductase (HMGCR).

**Coding Note:** Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C82****Myopathy in certain specified infectious or parasitic disease**

Myopathy in certain specified infectious or parasitic disease is an uncommon group of muscle diseases caused by a broad range of bacterial, fungal, parasitic, and viral agents. Bacterial organisms cause pyomyositis, psoas abscess, Staphylococcus aureus myositis, group A streptococcal necrotizing myositis, group B streptococcal myositis, clostridial gas gangrene, and nonclostridial myositis. Fungal myositis is rare and usually occurs among immunocompromised hosts. Parasitic myositis is most commonly a result of trichinosis or cysticercosis, but other protozoa or helminths may be involved. Viruses may cause benign acute myositis, pleurodynia, acute rhabdomyolysis, or an immune-mediated polymyositis.

**Coding Note:** Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C83****Myopathy in certain specified endocrine disease**

Myopathy in certain specified endocrine disease refers to muscle disorders associated with adrenal dysfunction (as steroid myopathy), thyroid dysfunction (as in myxoedema coma or thyrotoxic myopathy), parathyroid dysfunction (as in multiple endocrine neoplasia), pituitary dysfunction, and islands of Langerhans dysfunction (as in diabetic myopathy from ischemic infarction of the femoral muscles). Steroid myopathy is the most common endocrine myopathy. These conditions are usually reversible with correction of the underlying endocrine disturbance.

**Coding Note:** Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C84****Secondary rhabdomyolysis**

Secondary rhabdomyolysis occurs when the primary effect of a aetiological factor results in a functional or biochemical state which is conducive to the development of ischemic, degenerative, necrotic or membrane destabilizing changes in muscle, producing the clinical and biochemical features of rhabdomyolysis. Most frequently, rhabdomyolysis is secondary to a metabolic derangement often genetic in nature, as result of abnormally excessive movement, excessive isometric tension by attempted movement against resistance, or coma leading to increased intramuscular pressure, ischemia, hypoxia and necrosis. Secondary rhabdomyolysis can also be caused by a mutation in various genes (RYR1, LPIN).

**Coding Note:** Code also the causing condition

**Exclusions:** Myasthenia gravis or certain specified neuromuscular junction disorders (8C60-8C6Z)

Primary disorders of muscles (8C70-8C7Z)

**8C8Y****Other specified secondary myopathies**

**Coding Note:** Code also the causing condition

**8C8Z****Secondary myopathies, unspecified**

**Coding Note:** Code also the causing condition

**8D0Y****Other specified diseases of neuromuscular junction or muscle****8D0Z****Diseases of neuromuscular junction or muscle, unspecified****Cerebral palsy (8D20-8D2Z)**

#DRAFT# A heterogeneous group of nonprogressive motor disorders caused by developmental brain anomalies or chronic brain injuries that originate in the prenatal period, perinatal period, or first few years of life. The four major subtypes are spastic, athetoid, ataxic, and mixed cerebral palsy, with spastic forms being the most common. The motor disorder may range from difficulties with fine motor control to severe spasticity (see MUSCLE SPASTICITY) in all limbs. Spastic diplegia (Little disease) is the most common subtype, and is characterised by spasticity that is more prominent in the legs than in the arms. Pathologically, this condition may be associated with LEUKOMALACIA, PERIVENTRICULAR.

**Exclusions:** Hereditary spastic paraplegia (8B44.0)

**8D20****Spastic cerebral palsy**

Spastic cerebral palsy is characterised by increased muscle tone associated with hyperactive muscle stretch reflexes (deep tendon reflexes) and an increase in resistance to rapid muscle stretch. Extensor plantar responses are commonly present.

| <b>8D21</b>    | <b>Dyskinetic cerebral palsy</b><br>Dyskinetic cerebral palsy, also known as extrapyramidal cerebral palsy is characterised by impairment of voluntary movement because of the presence of interfering involuntary movements, and inappropriate co-contraction of agonist and antagonist muscles (dystonia). This group of disorders includes choreoathetotic cerebral palsy and dystonic cerebral palsy. The former is characterised by large amplitude, involuntary movements of mainly distal limbs (athetosis) with or without small amplitude, fleeting, asymmetric contractions of individual muscle groups (chorea).<br><br>Dystonic cerebral palsy predominantly affects proximal trunk and limb muscles, which may show slow, persistent movements, leading to the adoption of unusual postures, such as torticollis.<br><b>Inclusions:</b> Athetoid cerebral palsy |
| <b>8D22</b>    | <b>Ataxic cerebral palsy</b><br>Ataxic cerebral palsy is dominated by signs of cerebellar dysfunction, including hypotonia, ataxia, dysidiadochokinesis, dysmetria, dysarthria and nystagmus. Reflexes may be pendular, although there are often also signs of spasticity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**8D23****Worster-Drought syndrome**

Worster-Drought syndrome (WDS) is a form of cerebral palsy characterised by congenital pseudobulbar (suprabulbar) paresis manifesting as selective weakness of the lips, tongue and soft palate, dysphagia, dysphonia, drooling and jaw jerking.

## Nutritional or toxic disorders of the nervous system (8D40-8D4Z)

**8D40****Neurological disorders due to nutrient deficiency**

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Dementia due to pellagra (6D85.8)

White matter disorders due to nutritional deficiency (8A45.3)

Dementia due to nutritional deficiency (6D85.Y)

**8D40.0****Encephalopathy due to nutritional deficiency**

**Coding Note:** Code also the causing condition

**8D40.1****Neuropathy due to nutritional deficiency**

**Coding Note:** Code also the causing condition

**8D40.2****Myopathy due to nutritional deficiency**

**Coding Note:** Code also the causing condition

**8D40.3****Intellectual developmental disorder due to nutritional deficiency**

#DRAFT# This is a nutritional deficiency causing developmental conditions characterised by significant impairment of cognitive functions, which are associated with limitations of learning, adaptive behaviour and skills.

**Coding Note:** Code also the causing condition

**8D40.Y****Other specified neurological disorders due to nutrient deficiency**

**Coding Note:** Code also the causing condition

**8D40.Z****Neurological disorders due to nutrient deficiency, unspecified**

**Coding Note:** Code also the causing condition

**8D41****Neurological disorders due to an excess of micro or macro nutrients**

#DRAFT# This is a group of nervous system disorders due to an excess of micro and/or macronutrients. Micronutrients are required in trace amounts whereas macronutrients are required in relatively large amounts.

**Coding Note:** Code also the causing condition

**8D41.0****Peripheral neuropathy due to vitamin B6 hyperalimentation**

#DRAFT# This is a disorder of the peripheral nervous system due to an excess of vitamin B6 (pyridoxine) either due to administration or ingestion.

- 8D41.1      **Myopathy due to hypercalcaemia**
- 8D41.2      **Pseudotumour Cerebri related to Hypervitaminosis A**
- 8D41.Y      **Other specified neurological disorders due to an excess of micro or macro nutrients**

**Coding Note:** Code also the causing condition

- 8D41.Z      **Neurological disorders due to an excess of micro or macro nutrients, unspecified**

**Coding Note:** Code also the causing condition

## **8D42      Neurological disorders due to overweight or obesity in adults or children**

Neurological disorders that arise from the metabolic dysfunction, inflammation, and dyslipidemia caused by overweight (BMI > 25) or obese (BMI >30) status. Examples include mild cognitive impairment secondary to hippocampal alteration, hypothalamic dysfunction, autonomic dysfunction, peripheral polyneuropathy, and obstructive sleep apnea.

**Coding Note:** Code also the causing condition

## **8D43      Neurological disorders due to toxicity**

**Coded Elsewhere:** Neuromuscular junction disorders due to toxicity (NE61)

Intracranial hypertension associated with medication or toxin exposure (8D60.Y)

Myelopathy due to toxicity (8B42)

### **8D43.0      Encephalopathy due to toxicity**

8D43.00      Encephalopathy due to ammonia

8D43.0Y      Other specified encephalopathy due to toxicity

8D43.0Z      Encephalopathy due to toxicity, unspecified

### **8D43.1      Cognitive impairment due to toxicity**

These are conditions of impaired cognition due to the toxicity of substances.

**Coded Elsewhere:** Dementia due to exposure to heavy metals and other toxins (6D85.2)

Dementia due to carbon monoxide poisoning (6D84.Y)

Post radiation dementia (6D84.Y)

Dementia or parkinsonism due to manganese toxicity (6D84.Y)

| <b>8D43.2</b>  | <b>Neuropathy due to toxicity</b><br><p>In considering the diagnosis of toxic neuropathy, two criteria should be met: (1) Exposure can be verified and temporally related to the onset of clinical symptoms. Neuropathic symptoms usually occur concurrently with the exposure or following a variable latency of up to several months. (2) There must be neurological signs and abnormal electrodiagnostic studies, because many toxic neuropathies are subclinical, subjective symptoms may or may not occur. Removal from exposure results in cessation of progression of symptoms and the deficit. Most toxins produce symmetrical axonal degeneration in a length-dependent pattern, beginning in the distal segments of the long and large-calibre nerve fibres eventually spreading proximally with continued exposure. In addition to motor and/or sensory deficits, severe pain may be a characteristic feature.</p> <p><b>Coded Elsewhere:</b> Alcoholic polyneuropathy (8D44.0)</p> |

**8D44****Alcohol-related neurological disorders**

**Coded Elsewhere:** Dementia due to use of alcohol (6D84.0)

**8D44.0****Alcoholic polyneuropathy**

#DRAFT# This is a nerve disorder affecting multiple peripheral nerves simultaneously, which is due to the toxicity of alcohol.

**8D44.1****Alcoholic myopathy**

Myopathy secondary to alcohol use and includes acute and chronic alcoholic myopathy. Several forms have been described: acute necrotizing myopathy, acute hypokalaemic myopathy, chronic alcoholic myopathy, asymptomatic alcoholic myopathy, and alcoholic cardiomyopathy.

**8D44.Y****Other specified alcohol-related neurological disorders****8D44.Z****Alcohol-related neurological disorders, unspecified****8D4Y****Other specified nutritional or toxic disorders of the nervous system****8D4Z****Nutritional or toxic disorders of the nervous system, unspecified**

## Disorders of cerebrospinal fluid pressure or flow (8D60-8D6Z)

**8D60****Increased intracranial pressure**

An increase in pressure within the skull caused by changes in the volumes of the intracranial components, such as brain matter, CSF and blood, or by the presence of a pathological mass entity.

**8D60.0****Brain herniation syndromes**

The shift or displacement of brain tissue due to mass effect from its normal location to a region it does not occupy.

**8D60.1****Cerebral oedema**

Is an excess accumulation of fluid in the intracellular and/or extracellular spaces of the brain.

**Exclusions:**

Traumatic cerebral oedema (NA07.2)

Cerebral oedema due to birth injury (KA40.1)

**8D60.Y****Other specified increased intracranial pressure****8D60.Z****Increased intracranial pressure, unspecified****8D61****Intracranial hypotension**

The syndrome of intracranial hypotension is a single pathophysiological entity of diverse origin. Usually it is characterised by an orthostatic headache, one that occurs or worsens with upright posture. Patients with chronic headaches and asymptomatic patients have been described.

|                     |                                                                                                                                                                                                                                                                                     |

| <b>8D65</b>    | <p><b>Cerebrospinal fluid fistula</b></p> <p>Cerebrospinal fluid fistula is a condition in which the cerebrospinal fluid (CSF) held in and around the human brain and spinal cord leaks out of the surrounding protective sac, the dura, for no apparent reason or due to several pathological processes.</p>                                                                                                                                                                                                                                                      |
| <b>8D66</b>    | <p><b>Syringomyelia or syringobulbia</b></p> <p>In syringomyelia, there is fluid-filled tubular cavitation (syrinx formation) within the central spinal cord. The syrinx can elongate, enlarge and expand into the grey and white matter and, as it does so, it compresses the nervous tissue of the corticospinal and spinothalamic tracts and the anterior horn cells. This leads to the various neurological symptoms and signs. If the syrinx extends into the brainstem, syringobulbia results.</p> <p><b>Exclusions:</b> Congenital hydromyelia (LA07.3)</p> |

## Disorders of autonomic nervous system (8D80-8D8Z)

This is a group of conditions characterised as being in or associated with the autonomic nervous system, the

component of the peripheral nervous system that regulates involuntary physiologic processes.

**Inclusions:** Disorder of parasympathetic nervous system

**Coded Elsewhere:** Paroxysmal autonomic disorders

Hypohidrosis (EE01)

| <b>8D87.0</b>       | <b>Multiple system atrophy</b><br>Multiple system atrophy (MSA) is a rare neurodegenerative disorder characterised by varied combinations of parkinsonian, cerebellar, autonomic (erectile dysfunction, bladder dysfunction, orthostatic hypotension) and pyramidal features. The disease belongs to the group of alpha-synucleinopathies, a group of diseases characterised by aggregation of alpha-synuclein in affected brain regions. There are two different types: MSA-P (with parkinsonism) and MSA-C (with cerebellar dysfunction).                                  |

- 8D88.Z      Autonomic neuropathies, unspecified**
- 8D89      Disorders of orthostatic tolerance**  
 Disorders characterized by symptomatic arterial hypotension (lightheadedness, fatigue) when assuming an upright position usually due to dysfunction of adrenergic regulation.  
**Coded Elsewhere:** Orthostatic hypotension (BA21)
- 8D89.0      Reflex syncope**  
 Reflex syncope is a transient loss of consciousness with spontaneous recovery and associated with loss of postural tone. Reflex syncope is the most common form of syncope and can occur in individuals with normal autonomic function. The mechanism is believed to be related to blood pooling in the legs followed by reduction in blood return to the heart which triggers a sympathetic tone increase. Vigorous cardiac contractions with an underfilled ventricle are hypothesized to cause reflex loss of sympathetic tone and vagotonia.
- 8D89.1      Syncope due to autonomic failure**  
 #DRAFT# This is a disorder in which syncope occurs because of failure of the autonomic reflexes that maintain blood pressure and heart rate.

| <b>8D89.2</b> | <b>Postural orthostatic tachycardia syndrome</b><br>Postural Orthostatic Tachycardia Syndrome is a type of chronic orthostatic intolerance lasting three months or longer associated with excessive upright tachycardia in the absence of orthostatic hypotension, plus a constellation of typically daily symptoms which may include lightheadedness, dizziness, nausea, dyspnoea, diaphoresis, headache, fatigue and other symptoms of autonomic dysfunction. Excessive tachycardia is defined by present consensus as a heart rate increase of at least 30 beats per minute in adults (40 beats per minute for adolescents), or a heart rate greater than 120 beats per minute, within 10 minutes of upright tilt table testing. |
| <b>8D89.3</b> | <b>Baroreflex failure</b><br>#DRAFT# This is a group of disorders characterised by failure of the baroreflex mechanism. This can occur due to afferent, receptors, control centre or efferent baroreflex dysfunction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>8D8C</b>   | <b>Autonomic dysreflexia</b><br>This is a potentially dangerous disorder associated with damage to the spinal cord above the sixth thoracic level characterized by a marked increase in the sympathetic response to minor stimuli. It leads to sudden severe hypertension which can be life-threatening.                                                                                                                                                                                                                                                                                                                                                                                                                            |

**8D8D****Hypoglycaemia unawareness**

Hypoglycemia unawareness is defined at the onset of neuroglycopenia before the appearance of autonomic warning symptoms

**8D8Y****Other specified disorders of autonomic nervous system****8D8Z****Disorders of autonomic nervous system, unspecified****Human prion diseases (8E00-8E0Z)**

Human prion diseases or transmissible spongiform encephalopathies are rare transmissible diseases affecting the central nervous system. The infectious agents are composed of an abnormal isoform of a host membrane protein called 'prion protein' (PrP). Their common features are a long duration of incubation and lesions limited to the central nervous system without inflammatory or immunologic reaction but with accumulation of an abnormal form of prion protein (PrPsc).

**8E00****Sporadic Creutzfeldt-Jakob Disease**

A disease of the brain, that is associated with a mutation of normal prion protein genes or spontaneous transformation of prion proteins. This disease is characterised by a long incubation period, progressive dementia, neurological deficits, and is fatal. Transmission may be by direct contact with infected nervous tissue or blood. Confirmation is by pathological examination of the brain.

**8E01****Acquired prion disease**

Environmentally acquired prion diseases are prion diseases caused by a known source of abnormal prion protein.

**8E01.0****Iatrogenically acquired Creutzfeldt-Jakob Disease**

Iatrogenically acquired Creutzfeldt-Jakob Disease (iCJD) is CJD acquired by medical procedures, medicines, medicinal materials, or devices.

**8E01.1****Kuru**

A disease of the nervous system, caused by a prion. This disease is characterised by limb pain, ataxia, tremors, decreased coordination, or emotional changes, and is fatal. Transmission is by ingestion of infected human brain, or direct contact. Confirmation is commonly by clinical signs, or pathological examination of the brain.

**8E01.2****Variant Creutzfeldt-Jakob Disease**

A disease of the brain, that is suspected to be caused by a prion associated with Bovine Spongiform Encephalopathy. This disease is characterised by a long incubation period, psychiatric symptoms followed by neurological deficits, and is fatal. Transmission may be by ingestion of food (with a bovine origin) contaminated with infected brain or spinal cord from an infected cow, or blood transfusion. Confirmation is by pathological examination of the brain.

**8E01.3****Other acquired Creutzfeldt-Jakob Disease**

There have been cases of Creutzfeldt-Jakob Disease (CJD) associated with neurosurgical procedures and stereotactic electroencephalogram (EEG) electrode placement on the brain, particularly in the 1950s to 1970s when the transmissibility of prions was not yet recognised.

**8E01.Z**      **Acquired prion disease, unspecified**

**8E02**      **Genetic prion diseases**

**8E02.0**      **Genetic Creutzfeldt-Jakob disease**

A disease of the brain, that is associated with a prion. This disease is characterised by neurological deficits, and is fatal. Confirmation is by pathological examination of the brain.

**8E02.1**      **Gerstmann-Straussler-Scheinker syndrome**

A disease caused by inheritance of mutation(s) in normal prion protein genes. This disease is characterised by cerebellar ataxia, decreased coordination, dysmetria, or dysarthria, and is fatal. Confirmation is by pathological examination of the brain and genetic testing.

**Exclusions:**      Gerstmann syndrome (MB4C)

**8E02.2**      **Fatal familial insomnia**

A disease of the brain, caused by inheritance of mutation(s) of normal prion protein genes. This disease is characterised by severe insomnia and autonomic system dysfunction, and is fatal. Confirmation is by pathological examination of the brain and genetic testing.

**8E02.3**      **Other genetic prion diseases**

#DRAFT# This is a group of diseases due to mutations of the PRNP gene.

**8E02.Y**      **Other specified Creutzfeldt-Jakob disease**

**8E02.Z**      **Creutzfeldt-Jakob disease, unspecified**

**8E03**      **Variably protease sensitive prionopathy**

A disease of the brain, caused by a mutation(s) in prion protein genes. This disease is characterised by deposition of abnormal prions in the brain leading to behavioural and mood changes, speech deficits, and progressive motor impairments. Confirmation is by pathological examination of the brain or identification of protease-sensitive prion proteins in a brain sample.

**8E0Y**      **Other specified human prion diseases**

**8E0Z**      **Human prion diseases, unspecified**

## Disorders of consciousness (8E20-8E2Z)

**Coded Elsewhere:** Delirium (6D70)

Coma (MB20.1)

**8E20**      **Persistent vegetative state**

Subacute or chronic state of severe disturbance of consciousness lasting at least a month, characterised by the recovery of cyclic arousal states mimicking sleep/wake cycles after a severe brain injury. Patients with this condition are unresponsive and show no evidence of awareness of themselves or their environment. Cardiopulmonary and visceral autonomic regulation is maintained by the brainstem.

**8E21****Permanent vegetative state**

Prognostic term applied to patients in a persistent vegetative state for whom no recovery is expected.

**8E22****Minimally conscious state**

Subacute or chronic state of severely disturbed consciousness in which patients show minimal yet definite signs of consciousness, such as visual pursuit or command following, occurring after a severe brain injury. These patients do not show functional communication or functional use of objects.

**8E22.0****Minimally conscious state plus**

Subcategory of patients in a minimally conscious state who show signs of command following.

**8E22.1****Minimally conscious state minus**

Subcategory of patients in a minimally conscious state who show signs of non-reflex behaviour such as eye tracking, orientation to pain, or contingent responses to specific emotional stimuli but without command following.

**8E22.Y****Other specified minimally conscious state****8E22.Z****Minimally conscious state, unspecified****8E2Y****Other specified disorders of consciousness****8E2Z****Disorders of consciousness, unspecified**

## Other disorders of the nervous system (8E40-8E4Y)

**Coded Elsewhere:** Brain death (MH10)

Neurosarcoidosis (4B20.3)

**8E40****Disorders of the meninges excluding infection**

**Coded Elsewhere:** Postprocedural meningitis (8E62)

**8E40.0****Neoplastic meningitis**

Inflammation of the meninges due to malignant infiltration from carcinomas, leukaemias and lymphomas. The syndrome is clinically characterised by headache, neck stiffness, fever and photophobia with potential progression to stupor and coma. The presentation may be acute, subacute or chronic. Diagnosis may be aided by neuroimaging and spinal fluid analysis which may reveal a lymphocytic pleocytosis, raised protein and the presence of malignant cells on cytology.

**Coding Note:** Code also the causing condition

**8E40.1****Chemical meningitis**

The cranial and/or the spinal dura may be affected. Neurological features include headache, visual disturbance, cranial nerve palsies, ataxia and with spinal involvement, limb weakness, sensory impairment and sphincter disturbances . Diagnosis may be aided by neuroimaging and spinal fluid analysis.                                                                                                              |
| <b>8E41.0</b> | <b>Pachymeningitis due to infection</b>                              | Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater caused by chronic infection such as tuberculosis. The cranial and/or the spinal dura may be affected. Neurological features include headache, visual disturbance, cranial nerve palsies, ataxia and, with spinal involvement, limb weakness, sensory impairment and sphincter disturbances. Diagnosis may be aided by neuroimaging, spinal fluid analysis and dural biopsy.                                                                                                                                                     |
| <b>8E41.1</b> | <b>Idiopathic hypertrophic pachymeningitis</b>                       | Inflammation of the pachymeninges resulting in localised or diffuse thickening of the dura mater for which no identifiable cause is found. The cranial and/or the spinal dura may be affected. Neurological features include headache, visual disturbance, cranial nerve palsies, ataxia and with spinal involvement, limb weakness, sensory impairment and sphincter disturbances. Diagnosis may be aided by neuroimaging and spinal fluid analysis and dural biopsy.                                                                                                                                                           |
| <b>8E41.Y</b> | <b>Other specified pachymeningitis</b>                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>8E41.Z</b> | <b>Pachymeningitis, unspecified</b>                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**8E42****Superficial siderosis of the nervous system**

Superficial siderosis is the deposition of haemosiderin in the central nervous system as a result of chronic or recurrent subarachnoid haemorrhage due to vascular anomalies, aneurysms, vascular tumours, neurosurgery, cervical root lesions, head injury and trauma. Clinical features of Superficial siderosis include sensorineural deafness, cerebellar ataxia, pyramidal weakness and less frequently dementia, loss of sphincter control, anosmia, anisocoria, sensory disturbance, extra-ocular motor palsies, sciatica and lower motor neuron signs. The diagnosis may be confirmed by pure tone audiometry, neuroimaging, spinal fluid analysis, angiography to identify a potential bleeding source and where appropriate genetic testing.

**8E43****Pain disorders**

**Exclusions:** Chronic neuropathic pain (MG30.5)

**8E43.0****Neuropathic pain**

Neuropathic pain is described as electric, burning, or shock like, caused by metabolic, nutritional, infectious, genetic, autoimmune, and/or vasculitic processes. The pain may occur spontaneously, without provocation, or be provoked by noxious or nonnoxious stimuli. Pain is characteristic of small fibre neuropathy, but even in large fibre neuropathies, a sufficient number of small fibres may be damaged to cause pain. Neuropathic pain usually affects distal skin and subcutaneous structures. The pain may be constant or intermittent, and may be described as searing, burning, or icy cold.

Complex regional pain syndrome follows trauma and comprises regional pain, sensory changes, abnormalities of temperature, sudomotor activity, colour changes of the skin, and oedema.

**Exclusions:** Chronic neuropathic pain (MG30.5)

**8E43.00****Phantom limb syndrome**

Phantom limb pain is the perception of sensations, including pain, in a limb that has been amputated or a body part that has been removed. These sensations may include a specific position, shape, or movement of the phantom, feelings of warmth or cold, itching, tingling, or electric sensations, and other paraesthesias.

**8E43.0Y****Other specified neuropathic pain****8E43.0Z****Neuropathic pain, unspecified****8E43.Y****Other specified pain disorders****8E43.Z****Pain disorders, unspecified****8E44****Post anoxic brain damage**

Post anoxic brain damage refers to the variable severity of encephalopathy that results from circulatory arrest, hypotension or asphyxia.

**8E45****Locked-in syndrome**

**8E46****Reye syndrome**

Reye syndrome is sudden (acute) brain damage (encephalopathy) and liver function problems of unknown cause. The syndrome has occurred with the use of aspirin to treat chickenpox or the flu in children. However, it has become very uncommon since aspirin is no longer recommended for routine use in children. Reye syndrome often begins with vomiting, which lasts for many hours. The vomiting is quickly followed by irritable and aggressive behaviour. There is no specific treatment for this condition. The health care provider will monitor the pressure in the brain, blood gases, and blood acid-base balance (pH).

**8E47****Encephalopathy, not elsewhere classified**

Global brain dysfunction

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Neonatal encephalopathy (KB03)

**8E48****Encephalitis, not elsewhere classified****8E49****Postviral fatigue syndrome**

**Inclusions:** chronic fatigue syndrome  
myalgic encephalomyelitis

**Exclusions:** Fatigue (MG22)

**8E4A****Paraneoplastic or autoimmune disorders of the nervous system**

Paraneoplastic and autoimmune disorders of the nervous system result from a targeted immune attack on neurons or glial cells in the central (e.g. encephalopathy, ataxia, myelitis) or peripheral nervous systems (peripheral or autonomic neuropathies, neuromuscular junction disorders or myopathy). In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed autoimmune the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. These disorders are commonly multifocal causing injury and symptoms arising from involvement at many levels of the nervous system. A personal or family history of autoimmunity is often found. Accompanying neural and non-organ specific (thyroid peroxidase [TPO] antibodies) autoantibodies may be found. The neural autoantibody profile may be predictive of a specific cancer type and may be associated with a particular neurological phenotype. Exclusion of alternative etiologies (e.g. infections) is important. Response to immunotherapy may support the diagnosis.

**Coding Note:** Code also the causing condition

**8E4A.0 Paraneoplastic or autoimmune disorders of the central nervous system, brain or spinal cord**

Paraneoplastic and autoimmune disorders of the central nervous system, brain and spinal cord nervous system result from a targeted immune attack on neurons or glial cells in the central (e.g. encephalopathy, ataxia, myelopathy, myelitis) nervous system. In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed 'autoimmune' the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. These disorders are commonly multifocal causing injury and symptoms arising from involvement at many levels of the central nervous system. A personal or family history of autoimmunity is often found. Accompanying neural and non-organ specific (thyroid peroxidase [TPO] antibodies) autoantibodies may be found. The neural autoantibody profile may be predictive of a specific cancer type and may be associated with a particular neurological phenotype. Exclusion of alternative etiologies (e.g. infections) is important. Response to immunotherapy may support the diagnosis.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Paraneoplastic retinopathy (9B71.4)

Autoimmune retinopathy (9B71.5)

Opsoclonus-myoclonus (9C85.02)

**8E4A.1 Paraneoplastic or autoimmune disorders of the peripheral or autonomic nervous system**

Paraneoplastic and autoimmune disorders of the peripheral and autonomic nervous system result from a targeted immune attack on neurons or glial cells in the peripheral nervous systems (peripheral or autonomic neuropathies). In the paraneoplastic context, this attack is a consequence of a potentially effective tumour immune response initiated by onco-neural antigens derived from a systemic cancer. In the non-paraneoplastic context termed autoimmune the etiology remains elusive though increasing evidence indicates a preceding infectious trigger in at least some cases. Onset may be subacute or insidious and these disorders may be limited, multifocal or generalised. Autoimmune somatic peripheral nerve disorders may affect the nerve at multiple levels including root, nerve and plexus and may be axonal, demyelinating or both. Autoimmune autonomic disorders result in autonomic failure that can be partial or generalised. The prototypic autonomic neuropathy is the autoimmune ganglionopathy associated with

antibodies targeting the ganglionic nicotinic acetylcholine receptor ( $\alpha 3$  gAChR). Screening for cancer is appropriate for those with specific neural antibody profiles and other risk factors.

Associated neural antibodies in peripheral neuropathies include anti neuronal nuclear antibody type 1 or anti-Hu, CASPR2, gAChR, ganglioside (GM1 IgG and IGM) antibodies.

**Coding Note:** Code also the causing condition

**8E4A.2 Paraneoplastic or autoimmune neuromuscular transmission disorders**

NMT disorders are defined by a variable disturbance of the function of the neuromuscular transmission, resulting in fluctuating muscle weakness and fatigue. These are usually classified into pre- and postsynaptic disorders.

Presynaptic disorders, mainly the Lambert Eaton Myasthenic Syndrome (LEMS) is associated with antibodies targeting the voltage gated calcium channels (PQ and N type). LEMS is associated with malignancy (pulmonary or extra-pulmonary small cell carcinoma) in about 50% of cases. In the context of LEMS the detection of SOX 1 (anti glial nuclear) antibodies is highly predictive of cancer.

Postsynaptically, myasthenia gravis is mostly (> 90%) associated with antibodies targeting the muscle acetylcholine receptor (AChR) or rarely other proteins (including muscle -specific kinase -MuSK). Myasthenia is usually not considered a paraneoplastic disease, with the exception of thymoma in about 10% cases.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Lambert-Eaton syndrome (8C62)

Myasthenia gravis (8C60)

**8E4A.3 Paraneoplastic or autoimmune disorders of the muscle**

Paraneoplastic and autoimmune diseases of muscle present with weakness and can be caused by a variety of causes, either by undefined remote effects or autoimmune effects in cancer, or autoimmune mechanisms in non cancer related conditions. The presentation is variable, usually presenting with a proximal myopathic pattern.

## CHAPTER 09

---

### Diseases of the visual system

This chapter has 160 four-character categories.

Code range starts with 9A00

This refers to any diseases of the visual system, which includes the eyes and adnexa, the visual pathways and brain areas, which initiate and control visual perception and visually guided behaviour.

**Exclusions:**

- Certain conditions originating in the perinatal period (Chapter 19)
- Certain infectious or parasitic diseases (Chapter 01)
- Complications of pregnancy, childbirth and the puerperium (Chapter 18)
- Endocrine, nutritional or metabolic diseases (Chapter 05)
- Injury, poisoning or certain other consequences of external causes (Chapter 22)
- Posterior cortical atrophy (8A21.0)

**Coded Elsewhere:**

- Neoplasms of the eye or ocular adnexa
- Reasons for contact with the health care system in relation to eyes or vision
- Contusion of eyeball or orbital tissues (NA06.9)
- Foreign body in multiple parts of external eye (ND70.2)
- Oculocutaneous albinism (EC23.20)
- Traumatic injury to eyeball (NA06.8)
- Birth injury to eye (KA41)
- Late congenital syphilitic ophthalmopathy (1A60.2)
- Symptoms, signs or clinical findings of the visual system (MC10-MC2Y)
- Structural developmental anomalies of the eye, eyelid or lacrimal apparatus (LA10-LA1Z)

This chapter contains the following top level blocks:

- Disorders of the ocular adnexa or orbit
- Disorders of the eyeball - anterior segment
- Disorders of the eyeball - posterior segment
- Disorders of the eyeball affecting both anterior and posterior segments
- Disorders of the visual pathways or centres
- Glaucoma or glaucoma suspect
- Strabismus or ocular motility disorders
- Disorders of refraction or accommodation
- Postprocedural disorders of eye or ocular adnexa

- Impairment of visual functions
- Vision impairment
- Neoplasms of the eye or ocular adnexa
- Reasons for contact with the health care system in relation to eyes or vision

## Disorders of the ocular adnexa or orbit (9A00-9A4Z)

**Coded Elsewhere:** Ocular myiasis (1G01.0)

### Disorders of eyelid or peri-ocular area (9A00-9A0Z)

**Coded Elsewhere:** Congenital malformations of the eyelid

Seborrhoeic keratosis (2F21.0)

Cysts of eyelid (2F36.4)

Eyelid trauma (NA06.0)

Benign cutaneous neoplasm or cyst of eyelid (2F36.Z)

#### 9A00

### **Congenital malposition of eyelids**

**Coded Elsewhere:** Congenital entropion (LA14.02)

Congenital ectropion (LA14.03)

Congenital ptosis (LA14.04)

Hypotelorism (LB71.0)

Hypertelorism (LB71.1)

Epiblepharon (LA14.0Y)

#### 9A00.0

### **Dystopia canthorum**

**Coded Elsewhere:** Waardenburg syndrome (EC23.2Y)

#### 9A00.1

### **Telecanthus**

#DRAFT# This is either on the corner of the eye, where eyelids meet) refers to increased distance between the medial canthi of the eyes, while the inter-pupillary distance is normal. This is in contrast to hypertelorism, where the inter-pupillary distance is increased.

#### 9A00.Y

### **Other specified congenital malposition of eyelids**

#### 9A00.Z

### **Congenital malposition of eyelids, unspecified**

#### 9A01

### **Infectious disorders of eyelid**

**Coded Elsewhere:** Trachoma (1C23)

Involvement of eyelid in tuberculosis (1B12.1)

Involvement of eyelid in leprosy (1B20.3)

| <b>9A02.1</b>       | <b>Posterior blepharitis</b><br>Posterior blepharitis is inflammation of the eyelids secondary to dysfunction of the meibomian glands. Like anterior blepharitis it is a bilateral chronic condition and manifested by a broad spectrum of symptoms involving the lids including inflammation and plugging of the meibomian orifices and production of abnormal secretion upon pressure over the glands. It may be associated with skin rosacea. |
| <b>9A02.2</b>       | <b>Ligneous conjunctivitis</b><br>Ligneous conjunctivitis (LC) is a rare form of chronic conjunctivitis characterised by the recurrent formation of pseudomembranous lesions most commonly on the palpebral surfaces. It is most frequently reported as a clinical manifestation of severe homozygous or compound-heterozygous hypoplasminogenaemia. Most cases involve infants and children.                                                    |
| <b>9A02.4</b>       | <b>Meibomian gland dysfunction</b><br>This refers to the dysfunction of a special kind of sebaceous gland at the rim of the eyelids inside the tarsal plate, responsible for the supply of meibum, an oily substance that prevents evaporation of the eye's tear film. Meibum prevents tear spillage onto the cheek, trapping tears between the oiled edge and the eyeball, and makes the closed lids airtight.                                  |

| <b>9A03.1</b>  | <b>Entropion of eyelid</b><br>#DRAFT# This is a condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it. Entropion is usually caused by genetic factors and very rarely it may be congenital when an extra fold of skin grows with the lower eyelid (epiblepharon). Entropion can also create secondary pain of the eye (leading to self trauma, scarring of the eyelid, or nerve damage). The upper or lower eyelid can be involved, and one or both eyes may be affected.    |
| <b>9A03.10</b> | Cicatricial entropion of eyelid<br>#DRAFT# This is a condition in which the eyelid (usually the lower lid) folds inward, with areas of fibrous tissue (fibrosis) that replace normal skin after injury. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it. Entropion is usually caused by genetic factors and very rarely it may be congenital when an extra fold of skin grows with the lower eyelid (epiblepharon). Entropion can also create secondary pain of the eye (leading to self trauma, scarring of the eyelid, or nerve damage). |
| <b>9A03.11</b> | Mechanical entropion of eyelid<br>#DRAFT# This is a mechanical condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it. Entropion is usually caused by genetic factors and very rarely it may be congenital when an extra fold of skin grows with the lower eyelid (epiblepharon). Entropion can also create secondary pain of the eye (leading to self trauma, scarring of the eyelid, or nerve damage).                                                                      |

| <b>9A03.24</b> | <p>Floppy eyelid syndrome</p> <p>Acquired disorder of unknown origin, manifested by an easily everted floppy upper eyelid and papillary conjunctivitis of the upper palpebral conjunctiva. It is primarily associated with obese men and obstructive sleep apnoea. The tarsus of the upper eyelid becomes softer and looser probably due to mechanical forces and enzymatical changes. The upper eyelid everts during sleep, resulting in irritation, papillary conjunctivitis, and conjunctival keratinization. Effective treatment consists of preventing the upper eyelid from everting while the patient is sleeping.</p> |

| <b>9A04.0</b>  | <p><b>Trichiasis without entropion</b></p> <p>This refers to abnormally positioned eyelashes that grow back toward the eye, touching the cornea or conjunctiva. This can be caused by infection, inflammation, autoimmune conditions, congenital defects, eyelid agenesis and trauma such as burns or eyelid injury. This diagnosis is without a condition in which the eyelid (usually the lower lid) folds inward. It is very uncomfortable, as the eyelashes constantly rub against the cornea and irritate it.</p>                                                                                                       |
| <b>9A04.1</b>  | <p><b>Madarosis of eyelid or periocular area</b></p> <p>Partial or complete loss of eyelashes and/or eyebrow hairs. **9A04.Z      Acquired disorders of eyelashes, unspecified**

**9A05      Movement disorders of eyelid**

**Exclusions:**      Tic disorders (8A05)

**Coded Elsewhere:** Benign essential blepharospasm (8A02.00)

Hemifacial spasm (8B88.2)

Facial tic (8A05.03)

**9A05.0      Myokymia of eyelid**

Myokymia is used to describe an involuntary eyelid muscle contraction, typically involving the lower eyelid or less often the upper eyelid. It occurs in normal individuals and typically starts and disappears spontaneously. However, it can sometimes last up to three weeks. Since the condition typically resolves itself, medical professionals do not consider it to be serious or a cause for concern.

**Exclusions:**      Facial myokymia (8B88.1)

Myokymia (MB47.5)

**9A05.1      Eyelid apraxia**

#DRAFT# This is characterised by loss of the ability to execute or carry out learned purposeful movements of the eyelid, despite having the desire and the physical ability to perform the movements. It is a disorder of motor planning, which may be acquired or developmental, but is not caused by incoordination, sensory loss, or failure to comprehend simple commands (which can be tested by asking the person to recognize the correct movement from a series). It is caused by damage to specific areas of the cerebrum.

**9A05.Y      Other specified movement disorders of eyelid**

**9A05.Z      Movement disorders of eyelid, unspecified**

**9A06      Certain specified disorders of eyelid**

**9A06.0      Involvement of eyelid by dermatosis classified elsewhere**

Involvement of eyelid by skin diseases such as psoriasis or lichen planus.

**9A06.1      Vitiligo of eyelid or periocular area**

#DRAFT# This is a condition of the eyelid and periocular area that causes depigmentation of sections of skin. It occurs when melanocytes, the cells responsible for skin pigmentation, die or are unable to function. The cause of vitiligo is unknown, but research suggests that it may arise from autoimmune, genetic, oxidative stress, neural, or viral causes.

**9A06.2      Symblepharon, acquired**

#DRAFT# This is a partial or complete adhesion of the palpebral conjunctiva of the eyelid to the bulbar conjunctiva of the eyeball. It results either from disease (conjunctival sequelae of Trachoma) or trauma. Cicatricial pemphigoid and, in severe cases, rosacea may cause symblepharon. It is rarely congenital.

**9A06.3      Traumatic scar of eyelid**

|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9A10.1</b> | <b>Orbital inflammatory syndrome</b><br>This refers to a marginated mass-like enhancing soft tissue involving any area of the orbit. It is the most common painful orbital mass in the adult population, and is associated with proptosis, cranial nerve palsy (Tolosa-Hunt syndrome), uveitis, and retinal detachment.                                                                                                                                                  |
| <b>9A10.2</b> | <b>Benign lymphoepithelial lesion of lacrimal gland</b><br>This is a type of benign enlargement of the parotid and/or lacrimal glands. This pathologic state is sometimes, but not always, associated with Sjögren's syndrome. This diagnosis is of paired almond-shaped glands, one for each eye, that secrete the aqueous layer of the tear film.                                                                                                                      |
| <b>9A10.3</b> | <b>Hyperlacrimation</b><br>Overflow of tears due to excessive secretion by the lacrimal gland. It may be caused by drugs (e.g. pilocarpine), strong emotion; or as a reflex from trigeminal stimulation by an inflamed eye; or irritation of the cornea or conjunctiva by a chemical irritant in the air; cold wind; or a foreign body in the eye. The main symptoms are discomfort and blurring of vision and sometimes embarrassment. Management depends on the cause. |
| <b>9A10.4</b> | <b>Underproduction of tears</b><br>Underproduction of tears causes keratoconjunctivitis sicca and can be caused by disorders that interrupt the neural control of lacrimation.                                                                                                                                                                                                                                                                                           |
| <b>9A10.Y</b> | <b>Other specified disorders of lacrimal gland</b>                                                                                                                                                                                                                                                                                                                                                                                                                       |

Disorders of orbit (9A20-9A2Z)

This refers to disorders of the cavity or socket of the skull in which the eye and its appendages are situated. "Orbit" can refer to the bony socket, or it can also be used to imply the contents.

**Coded Elsewhere:** Neoplasms of orbit  
Orbital trauma  
Structural developmental anomalies of orbit (LA14.2)

## Disorders of the eyeball - anterior segment (9A60-9B3Z)

This refers to any disorders of the front third of the eye that includes the structures in front of the vitreous humour: the cornea, iris, ciliary body, and lens.

**Coded Elsewhere:** Structural disorders of the pupil (LA11.6)  
Developmental anomalies of anterior segment (LA11.Y)

## Disorders of conjunctiva (9A60-9A6Z)

This is a group of conditions associated with the conjunctiva which lines the inside of the eyelids and covers the sclera.

**Coded Elsewhere:** Neoplasms of conjunctiva

| <b>9A60.01</b> | <p>Acute atopic conjunctivitis</p> <p>This is the allergic inflammation of the conjunctiva (mucous membrane that covers the posterior surface of the eyelids and the anterior pericorneal surface of the eyeball) of the immediate type, due to airborne allergens such as pollens, dusts, spores, and animal hair.</p>                                                                                                                                                                         |
| <b>9A60.02</b> | <p>Allergic conjunctivitis</p> <p>Allergic conjunctivitis is an IgE-mediated response due to the exposure of seasonal or perennial allergens in sensitized patients. The allergen-induced inflammatory response of the conjunctiva results in the release of histamine and other mediators. Symptoms consist of redness (mainly due to vasodilation of the peripheral small blood vessels), oedema (swelling) of the conjunctiva, itching, and increased lacrimation (production of tears).</p> |

| <b>9A60.5</b> | <b>Vernal keratoconjunctivitis</b>                | Vernal keratoconjunctivitis is a persistent and severe form of ocular allergy that affects children and young adults, usually in warm climates. Vernal keratoconjunctivitis typically appears in boys between the ages of 4–12 years. The typical symptoms are intense itching, tearing, and photophobia. Disease exacerbation can be triggered either by allergen re-exposure or by nonspecific stimuli such as sunlight, wind, and dust. The tarsal form is characterised by irregularly sized hypertrophic papillae, leading to a cobblestone appearance of the upper tarsal plate. The limbal form is characterised by transient, multiple limbal, or conjunctival gelatinous yellow-grey infiltrates superposed with white points or deposits, known as Horner–Trantas dots and papillae at the limbus. |

| <b>9A61.0</b> | <b>Pingueculae</b>                                | #DRAFT# This is a common type of conjunctival degeneration in the eye. It is seen as a yellow white deposit on the conjunctiva adjacent to the limbus (the junction between the cornea and sclera). It is to be distinguished clinically from pterygium, which is a wedge shaped area of fibrosis that appears to grow into the cornea.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>9A61.1</b> | <b>Pterygium</b>                                  | #DRAFT# This is a benign growth of the conjunctiva extending onto cornea that is characterised by elastotic degeneration of collagen (actinic elastosis) and fibrovascular proliferation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Disorders of the cornea (9A70-9A7Z)

This refers to disorders of the transparent front part of the eye that covers the iris, pupil, and anterior chamber. The cornea, with the anterior chamber and lens, refracts light, with the cornea accounting for approximately two-thirds of the eye's total optical power.

**Coded Elsewhere:** Neoplasms of the cornea

### 9A70

#### Hereditary corneal dystrophies

The term corneal dystrophy embraces a heterogeneous group of bilateral genetically determined non-inflammatory corneal diseases that are usually restricted to the cornea. The designation is imprecise but remains in vogue because of its clinical value.

**Coded Elsewhere:** X-linked ichthyosis (EC20.01)

Cornea plana (LA11.1)

Megalocornea (LA11.1)

Microcornea (LA11.1)

| <b>9A78.20</b> | <p>Bullous keratopathy</p> <p>This is the maximum stage of corneal oedema.</p> <p>It is a pathological condition in which small vesicles, or bullae, are formed in the cornea due to endothelial dysfunction. In a healthy cornea, endothelial cells keep the tissue from excess fluid absorption, pumping it back into the aqueous humour. When affected by some reason, such as Fuchs' dystrophy or a trauma during cataract removal, endothelial cells suffer mortality or damage. The corneal endothelial cells normally do not undergo mitotic cell division, and cell loss results in permanent loss of function.</p> |
| <b>9A78.21</b> | Secondary corneal oedema                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## **9A90**

### **Degeneration of iris or ciliary body**

#DRAFT# This is gradual deterioration of the iris and the ciliary body with impairment or loss of function, caused by injury, disease, or aging.

#### **9A90.0**

##### **Disorders of chamber angle**

This refers to the change of tissue to a lower or less functionally active form, of the fluid-filled space inside the eye between the iris and the cornea's innermost surface, the endothelium.

#### **9A90.1**

##### **Degeneration of iris**

This refers to the change of tissue to a lower or less functionally active form, of the thin, circular structure in the eye, responsible for controlling the diameter and size of the pupil and thus the amount of light reaching the retina. The color of the iris is often referred to as "eye color."

#### **9A90.2**

##### **Iris atrophy**

#### **9A90.Y**

##### **Other specified degeneration of iris or ciliary body**

#### **9A90.Z**

##### **Degeneration of iris or ciliary body, unspecified**

## **9A91**

### **Cyst of iris or ciliary body**

#DRAFT# This is a closed sac, associated with iris and ciliary body that may contain air, fluids, or semi-solid material, having a distinct membrane and division compared to the nearby tissue.

## **9A92**

### **Persistent pupillary membranes**

#DRAFT# This is a condition of the eye involving remnants of a fetal membrane that persist as strands of tissue crossing the pupil. It normally atrophies from the time of birth to the age of four to eight weeks. PPM occurs when this atrophy is incomplete.

## **9A93**

### **Adhesions or disruptions of iris or ciliary body**

This refers to adhesions and disruptions of the thin, circular structure in the eye, responsible for controlling the diameter and size of the pupil and thus the amount of light reaching the retina. The colour of the iris is often referred to as "eye colour." It is also of the circumferential tissue inside the eye composed of the ciliary muscle and ciliary processes. It is triangular in horizontal section and is coated by a double layer, the ciliary epithelium.

**Exclusions:** Corectopia (LA11)

**9A94****Certain specified disorders of iris or ciliary body**

#DRAFT# This is a group of conditions associated with iris and the ciliary body, that is the circumferential tissue inside the eye composed of the ciliary muscle and ciliary processes, which are not classified elsewhere.

**9A94.0****Rubeosis of iris****9A94.1****Floppy iris syndrome**

This is a complication that may occur during cataract extraction in certain patients. This syndrome is characterised by a flaccid iris which billows in response to ordinary intraocular fluid currents, a propensity for this floppy iris to prolapse towards the area of cataract extraction during surgery, and progressive intraoperative pupil constriction despite standard procedures to prevent this.

**9A94.2****Plateau iris syndrome****9A94.Y****Other disorders of iris and ciliary body****9A96****Anterior uveitis**

#DRAFT# This is an inflammation of the iris and the anterior chamber, which is the fluid-filled space inside the eye between the iris and the cornea's innermost surface.

**Coding Note:** Code also the causing condition

**9A96.0****Anterior uveitis not associated with systemic conditions****9A96.1****Anterior uveitis associated with systemic conditions**

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Sarcoid associated anterior uveitis (4B20.4)

**9A96.2****Infection-associated anterior uveitis**

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Gonococcal anterior uveitis (1A72.4)

Zoster anterior uveitis (1E91.1)

Secondary syphilitic anterior uveitis (1A61.4)

Tuberculous anterior uveitis (1B12.1)

Chronic tuberculous iridocyclitis (1B12.1)

Syphilitic uveitis (1A62.20)

**9A96.3****Primary anterior uveitis**

This refers to primary inflammation of the uvea. The uvea consists of the middle, pigmented, vascular structures of the eye and includes the iris, ciliary body, and choroid.

**9A96.Y****Other specified anterior uveitis**

**Coding Note:** Code also the causing condition

**9A96.Z****Anterior uveitis, unspecified**

**Coding Note:** Code also the causing condition

**9A9Y**      **Other specified disorders of the anterior uvea**

**9A9Z**      **Disorders of the anterior uvea, unspecified**

Functional disorders of the pupil (9B00-9B0Z)

**9B00**      **Disorders of the afferent pupillary system**

**9B00.0**      **Relative afferent pupillary defects**

**9B00.1**      **Amaurotic pupillary reaction**

**9B00.2**      **Paradoxical pupillary reaction to light or darkness**

**9B00.3**      **Wernicke pupils**

**9B00.Y**      **Other specified disorders of the afferent pupillary system**

**9B00.Z**      **Disorders of the afferent pupillary system, unspecified**

**9B01**      **Disorders of the efferent pupillary system**

***Coded Elsewhere:*** Horner syndrome (8D8A.1)

Horner syndrome, acquired (8D8A.1)

Horner syndrome, congenital (8D8A.1)

**9B01.0**      **Physiologic anisocoria**

#DRAFT# This is when human pupils differ in size. It is generally considered to be benign, though it must be distinguished from Congenital Horner's syndrome, pharmacological dilatation or other conditions connected to the sympathetic nervous system. The prevalence of physiological anisocoria has not been found to be influenced by the sex, age, or iris colour of the subject.

**9B01.1**      **Parasympathoparetic pupils**

Damage to the parasympathetic outflow to the iris sphincter muscle

***Coded Elsewhere:*** Third nerve palsy (9C81.0)

**9B01.2**      **Pharmacologic inhibition of the parasympathetic pathway**

**9B01.3**      **Iris sphincter disorders**

This refers to disorders of the muscle in the part of the eye called the iris. It encircles the pupil of the iris, appropriate to its function as a constrictor of the pupil.

**9B01.4**      **Pharmacologic parasympathicotonic pupils**

Pharmacologic stimulation of the parasympathetic pathway

**9B01.5**      **Pharmacologic sympathoparetic pupils**

**9B01.6**      **Sympathotonic pupils**

**9B01.7**      **Episodic unilateral mydriasis**

**9B01.Y**      **Other specified disorders of the efferent pupillary system**

**9B01.Z Disorders of the efferent pupillary system, unspecified**

**9B02 Light-near dissociations**

#DRAFT# This is when the pupil does not react to light, but it does react to accommodation. Other causes of light-near dissociation involve damage to the brainstem, where a tonic pupil is not produced. Brainstem causes of light-near dissociation include Argyll Robertson pupil and Parinaud syndrome.

**9B02.0 Argyll Robertson pupil**

These are bilateral small pupils that constrict when the patient focuses on a near object but do not constrict when exposed to bright light (they do not “react” to light).

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Syphilitic Argyll Robertson pupil (1A62.01)

**9B02.1 Pregeniculate light-near dissociations**

**9B02.2 Mesencephalic light-near dissociations**

**9B02.Y Other specified light-near dissociations**

**9B02.Z Light-near dissociations, unspecified**

**9B0Y Other specified functional disorders of the pupil**

**9B0Z Functional disorders of the pupil, unspecified**

Disorders of lens (9B10-9B1Z)

#DRAFT# This is a group of conditions associated with the lens, a transparent, biconvex structure in the eye that, along with the cornea, helps to refract light to be focused on the retina.

**Coded Elsewhere:** Structural developmental anomalies of lens or zonula (LA12)

Presence of intraocular lens (QB51.2)

**9B10 Cataract**

#DRAFT# This is a clouding of the lens inside the eye which leads to a decrease in vision. It is the most common cause of blindness and is conventionally treated with surgery. Visual loss occurs because opacification of the lens obstructs light from passing and being focused on to the retina at the back of the eye.

**9B10.0 Age-related cataract**

A senile cataract is a clouding of the lens of the eye, which impedes the passage of light, related to ageing, and that occurs usually starting from the age of 40.

**Exclusions:** capsular glaucoma with pseudoexfoliation of lens (9C61.0)

**9B10.00 Coronary age-related cataract**

**9B10.01 Punctate age-related cataract**

|                |                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9B10.02</b> | Mature age-related cataract<br>This is a mature age-related clouding of the lens inside the eye which leads to a decrease in vision. **9B10.2Y** Other specified cataracts

**Coding Note:** Code also the causing condition

**9B10.Z** **Cataract, unspecified**

**9B11** **Certain specified disorders of lens**

#DRAFT# This is a group of conditions associated with the lens, a transparent, biconvex structure in the eye that, along with the cornea, helps to refract light to be focused on the retina, which are not classified elsewhere.

**Exclusions:** congenital lens malformations (LA12)  
Cataract lens fragments in eye following cataract surgery (9D21)

**Coded Elsewhere:** Presence of intraocular lens (QB51.2)

**9B11.0** **Aphakia**

#DRAFT# This is the absence of the lens of the eye, due to surgical removal, a perforating wound or ulcer, or congenital anomaly. It causes a loss of accommodation, far sightedness (hyperopia), and a deep anterior chamber. Complications include detachment of the vitreous or retina, and glaucoma.

**9B11.1** **Dislocation of lens**

#DRAFT# This is abnormal position of the crystalline lens of the eye due to abnormality of or injury to the suspensory ligaments (zonular fibres) that anchor the lens to the ciliary muscle.

**9B11.Y** **Other disorders of lens**

**9B1Z** **Disorders of lens, unspecified**

---

**9B3Y** **Other specified disorders of the eyeball - anterior segment**

**9B3Z** **Disorders of the eyeball - anterior segment, unspecified**

## Disorders of the eyeball - posterior segment (9B50-9C0Z)

This refers to disorders of the back two-thirds of the eye that includes the anterior hyaloid membrane and all of the optical structures behind it: the vitreous humour, retina, choroid, and optic nerve.

### Disorders of sclera (9B50-9B5Z)

**Coded Elsewhere:** Blue sclera (LA11.0)

#### 9B50

##### Episcleritis

Episcleritis is a benign, self-limiting inflammatory disease affecting part of the eye called the episclera. The episclera is a thin layer of tissue that lies between the conjunctiva and the connective tissue layer that forms the white of the eye (sclera). Episcleritis is a common condition, and is characterised by the abrupt onset of mild eye pain and redness.

**Coded Elsewhere:** Tuberculous episcleritis (1B12.1)  
Late syphilitic episcleritis (1A62.20)

#### 9B51

##### Scleritis

Inflammation of the white, opaque, fibrous, outer tunic of the eyeball. Can be associated with uveitis.

**Coded Elsewhere:** Zoster scleritis (1E91.1)

#### 9B52

##### Scleral staphyloma

**Exclusions:** degenerative myopia (9B76)

#### 9B5Y

##### Other specified disorders of sclera

#### 9B5Z

##### Disorders of sclera, unspecified

### Disorders of the choroid (9B60-9B6Z)

**Inclusions:** Disorders of posterior uvea

**Coded Elsewhere:** Neoplasms of choroid

Congenital malformations of choroid (LA13.6)

#### 9B60

##### Choroidal degeneration

#DRAFT# This is gradual deterioration of the choroid, the vascular layer of the eye, with impairment or loss of function, caused by injury, disease, or aging.

**Exclusions:** angioid streaks (9B78.3)

#### 9B61

##### Choroidal dystrophy

#DRAFT# This is a group of progressive, hereditary disorders that are characterised by clinically apparent retinal pigment epithelial (RPE) and choroidal atrophy.

**Exclusions:** ornithinaemia (5C50.9)

#### 9B62

##### Chorioretinal scars

#DRAFT# This is an area of pigmentary change or fibrosis that is located on the inside surface of the eye.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Usher syndrome (LD2H.4)

Asphyxiating thoracic dystrophy (LD24.B1)

**9B71**

**Retinopathy**

**Coding Note:** Code also the causing condition

**9B71.0**

**Diabetic retinopathy**

A condition characterised as a disease of the retina (retinopathy) involving damage to the small blood vessels in the retina which is due to chronically high blood glucose levels in people with diabetes.

**Coding Note:** Always assign an additional code for diabetes mellitus.

**9B71.00**

**Nonproliferative diabetic retinopathy**

#DRAFT# This is nonproliferative retinopathy (damage to the retina) caused by complications of diabetes, which can eventually lead to blindness. It is an ocular manifestation of diabetes, a systemic disease, which affects up to 80 percent of all patients who have had diabetes for 10 years or more.

Always assign an additional code for the type of diabetes mellitus.

**Coding Note:** Code also the causing condition

**9B71.01**

**Proliferative diabetic retinopathy**

|                     | Radiation retinopathy is damage to retina due to exposure to ionizing radiation. Radiation retinopathy has a delayed onset, typically after months or years of radiation, and is slowly progressive. In general, radiation retinopathy is seen around 18 months after treatment with external-beam radiation and with brachytherapy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                     | Retinopathy of prematurity is a vasoproliferative disorder that affects extremely premature infants potentially leading to severe visual impairment or blindness. Exposure of newborn premature infants to hyperoxia down regulates retinal vascular endothelial growth factor. Blood vessels constrict and can become obliterated, resulting in delays of normal retinal vascular development. Low birth weight, young gestational age, and severity of illness (e.g. respiratory distress syndrome, bronchopulmonary dysplasia, sepsis) are associated factors. It primarily occurs in extremely low birth weight infants because of the cessation of normal retinal vascular maturation.                                                                                                                                     |

|                     | Paraneoplastic retinopathies result from a targeted attack on the retina due to a tumour immune response initiated by onco-neural antigens derived from systemic cancer. Patients usually present after cancer diagnosis with progressive visual dimming and photopsias but dysfunction of rods (impaired dark adaption and peripheral vision loss) and cones (decreased visual acuity, colour dysfunction, photosensitivity and glare) may also occur. Symptoms are often worse than clinical signs. Other causes of retinopathy should be excluded. Multiple anti-retinal autoantibodies (e.g. anti-recoverin antibodies) are described although their significance is uncertain. Two major subsets are recognised: cancer-associated retinopathy (most commonly small-cell lung cancer) and melanoma-associated retinopathy. |
|                     | Associated neural autoantibodies include:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**9B71.5****Autoimmune retinopathy**

Autoimmune retinopathies are immune-mediated inflammatory disorders of the retina that differ from paraneoplastic retinopathies in the lack of association with cancer. Patients present with progressive visual loss and dysfunction of rods (impaired dark adaption and peripheral vision problems) and cones (visual acuity, colour dysfunction, photosensitivity and glare) may occur. The symptoms are often worse than the clinical signs on fundoscopy. Multiple anti-retinal autoantibodies (e.g. anti-recoverin antibodies) are described although their significance is uncertain. Autoimmune retinopathy is a diagnosis of exclusion and other causes of retinopathy need to be ruled out, while the potential role of immunotherapy remains uncertain.

Associated neural autoantibodies include:

anti-recoverin autoantibodies; alpha-enolase autoantibodies; anti-transducin autoantibodies.

**Coding Note:** Code also the causing condition

**9B71.Z****Retinopathy, unspecified**

**Coding Note:** Code also the causing condition

**9B72****Inflammatory diseases of the retina**

This refers to inflammatory diseases of light-sensitive layer of tissue, lining the inner surface of the eye. The optics of the eye create an image of the visual world on the retina, which serves much the same function as the film in a camera.

**Coded Elsewhere:** Retinal vasculitis (9B78.12)

**9B72.0****Viral retinitis****9B72.00****Cytomegaloviral retinitis**

This is an inflammation of the eye's retina that can lead to blindness. This is a DNA virus in the family Herpesviridae known for producing large cells with nuclear and cytoplasmic inclusions. Such inclusions are called an "owl's eye" effect.

**9B72.01****HIV retinitis****9B72.0Y****Other specified viral retinitis****9B72.0Z****Viral retinitis, unspecified****9B72.Y****Other specified inflammatory diseases of the retina****9B72.Z****Inflammatory diseases of the retina, unspecified****9B73****Retinal detachments or breaks**

Retinal breaks are full thickness openings in the neurosensory retina that can be in the form of a hole, a tear or a retinal dialysis. Retinal detachment is a condition in which the retina peels away from its underlying layer of support tissue.

**Exclusions:** detachment of retinal pigment epithelium (9B78.6)

| <b>9B75.3</b>  | <b>Macular telangiectasia</b><br>#DRAFT# This is a condition of the retina about which may result in blindness. It is a form of pathologically dilated blood vessels (telangiectasia) at the region of highest visual acuity, the yellow spot in the human eye (macula). The tissue deteriorates and the retinal structure becomes scarred due to the development of liquid-filled cysts, which impairs nutrition of the photoreceptor cells and destroys vision permanently. |

| <b>9B83</b> | <b>Vitreous haemorrhage</b><br>#DRAFT# This is the extravasation, or leakage, of blood into the areas in and around the vitreous humour of the eye. The vitreous humour is the clear gel that fills the space between the lens and the retina of the eye. A variety of conditions can result in blood leaking into the vitreous humour, which can cause impaired vision, floaters, and photopsia |

## Disorders of the visual pathways or centres (9C40-9C4Z)

This refers to disorders part of the central nervous system which gives organisms the ability to process visual detail, as well as enabling the formation of several non-image photo response functions.

| <b>9C40.B</b>  | <p><b>Optic atrophy</b></p> <p>Optic atrophies (OA) refer to a specific group of hereditary optic neuropathies in which the cause of the optic nerve dysfunction is inherited either in an autosomal dominant or autosomal recessive pattern. Autosomal dominant optic atrophy (ADOA), type Kjer, is the most common OA, whereas autosomal recessive optic atrophy (AROA) is a rare form.</p> <p><b>Coded Elsewhere:</b> Leber hereditary optic neuropathy (8C73.Y)</p> |

|               | Primary open-angle glaucoma is a chronic progressive optic neuropathy with characteristic morphological changes at the optic nerve head and retinal nerve fibre layer in the absence of other ocular disease or congenital anomalies. Progressive retinal ganglion cell death and visual field loss are associated with these changes. Anterior chamber angle appearance is normal and major risk factors include level of intraocular pressure and older age. |

|                     | Neovascular secondary angle-closure glaucoma is a frequent condition where neovascular membranes occlude and close the chamber angle by fibrovascular contraction leading to intraocular pressure elevation and subsequent optic nerve damage. Neovascularization can be due to retinal venous occlusion, diabetic retinopathy, ocular ischemia, long-standing retinal detachment and other ischemic conditions of the eye. |

**9C6Y**      **Other specified glaucoma or glaucoma suspect**

**9C6Z**      **Glaucoma or glaucoma suspect, unspecified**

## Strabismus or ocular motility disorders (9C80-9C8Z)

Disorder due to abnormalities of extraocular muscles or ocular motor abnormalities.

**Coded Elsewhere:** Diseases of neuromuscular junction or muscle (8C60-8D0Z)

### **9C80**      **Non paralytic strabismus**

Non-paralytic strabismus is an abnormal binocular alignment in which one of the eyes is deviated. There are full ocular movements in each eye. The condition can alternate between eyes or only involve one eye. Strabismus may be intermittent or constant. The abnormal alignment may be present at distance fixation, near fixation or both.

#### **9C80.0**      **Esotropia**

Esotropia is an abnormal binocular alignment in which one of the eyes has an inward deviation. Fixation can be alternating or monocular. Esotropia is present in all distances. Squint angles can vary with distances.

#### **9C80.1**      **Exotropia**

Exotropia is an abnormal binocular alignment in which one of the eyes has an outward deviation. Fixation can be alternating or monocular. Exotropia is present in all distances.

#### **9C80.2**      **Vertical or torsional strabismus**

An abnormal binocular alignment which may be constant or intermittent, that is not horizontal, but vertical or torsional (rotational) around the pupillary axis.

#### **9C80.3**      **Intermittent strabismus**

An abnormal binocular alignment which is present intermittently, with normal alignment at other times with binocular single vision.

#### **9C80.30**      Intermittent divergent exotropia

#### **9C80.31**      Intermittent convergent esotropia

#### **9C80.3Y**      Other specified intermittent strabismus

#### **9C80.3Z**      Intermittent strabismus, unspecified

#### **9C80.4**      **Heterophoria**

A temporary deviation of the eyes from normal binocular alignment when there is disruption of the visual input from one eye. The alignment is normal when there is binocular visual input.

| <b>9C82.0</b>  | <b>Progressive external ophthalmoplegia</b><br>Chronic ophthalmoplegia is characterised by progressive weakness of ocular muscles and levator muscle of the upper eyelid. The condition is mainly manifested in adults. It may be totally and permanently isolated, however in a minority of cases it is associated with skeletal myopathy, which causes abnormal fatigability and even permanent muscle weakness. In this case the affection is still termed isolated progressive external ophthalmoplegia. A large proportion of chronic ophthalmoplegias presents with multisystemic pattern of signs: neurological signs (hearing loss, retinopathy, cerebellar disorders, peripheral neuropathy, etc.), endocrine (diabetes, hypogonadism, hypoparathyroidism, etc.), kidney (kidney failure, tubulopathy, etc.), and heart disorders (conduction disorders, myocardiopathy, etc.). |

| 9D00.0      | <b>Myopia</b><br>A refractive error in which rays of light entering the eye parallel to the optic axis are brought to a focus in front of the retina when ocular accommodation is relaxed. This usually results from the eyeball being too long from front to back, but can be caused by an overly curved cornea, a lens with increased optical power, or both. It is also called nearsightedness.<br><b>Exclusions:</b> degenerative myopia (9B76) |
| 9D00.1      | <b>Hypermetropia</b><br>A refractive error in which rays of light entering the eye parallel to the optic axis are brought to a focus behind the retina, as a result of the eyeball being too short from front to back. It is also called farsightedness because the near point is more distant than it is in emmetropia with an equal amplitude of accommodation.                                                                                   |

|               |                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9D00.2</b> | <b>Astigmatism</b><br>Unequal curvature of the refractive surfaces of the eye. Thus a point source of light cannot be brought to a point focus on the retina but is spread over a more or less diffuse area. This results from the radius of curvature in one plane being longer or shorter than the radius at right angles to it. |
| <b>9D00.3</b> | <b>Presbyopia</b><br>The normal decreasing elasticity of the crystalline lens that leads to loss of accommodation.                                                                                                                                                                                                                 |
| <b>9D00.4</b> | <b>Anisometropia</b>                                                                                                                                                                                                                                                                                                               |
| <b>9D00.5</b> | <b>Aniseikonia</b>                                                                                                                                                                                                                                                                                                                 |

| <b>9D21</b> | <b>Cataract lens fragments in eye following cataract surgery</b>                                             |
| <b>9D22</b> | <b>Chorioretinal scars after surgery for detachment</b>                                                      |
| <b>9D23</b> | <b>Conjunctival blebitis after glaucoma surgery</b>                                                          |

**9D24                      Complications with glaucoma drainage devices**

**9D25                      Glaucoma due to ocular surgery or laser**

## Impairment of visual functions (9D41-9D7Z)

**Coded Elsewhere:** Impairment of electrophysiological functions (MC21)

Polyopia (9D53)

**9D41                      Impairment of visual field**

Ranges of visual field impairment refer to the extent of peripheral vision outside fixation. The extent should be measured for each eye separately.

**9D42                      Patterns of visual field impairment**

Patterns of visual field impairment are often indicative for certain disease conditions.

**9D42.0                   Visual field loss, pattern not specified**

**9D42.2                   Peripheral field deficit**

**9D42.20                Enlarged blind spot**

**Inclusions:**                      Scotoma of blind spot area

**9D42.21                Arcuate scotoma**

A Bjerrum or arcuate scotoma follows the pattern of the retinal nerve fibres. It is typical for glaucomatous defects and can also be caused by juxta-papillary lesions.

**9D42.22                Nasal step**

A nasal step is a discontinuity of the nasal field limit at the horizontal meridian. It is typical for glaucoma.

**9D42.23                Ring scotoma**

A ring scotoma is a scotoma that surrounds the central field. Initially, it may consist of several smaller scotomas that gradually coalesce.

**9D42.24                Isolated peripheral scotoma**

Isolated scotomas may be the result of scarring from infections or surgery.

**9D42.2Y                Other specified peripheral field deficit**

**9D42.2Z                Peripheral field deficit, unspecified**

**9D42.3                   Hemianopic or quadrantic loss**

Defects that cover a hemi-field or a quadrant in one eye may be the result of optic nerve involvement.

**9D42.4                   Central scotoma**

A central scotoma is a defect that covers the fovea. It therefore causes visual acuity loss and may necessitate eccentric fixation.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9D42.5</b>  | <b>Para-central scotoma</b><br>A para-central scotoma is a scotoma adjacent to the fovea. Both may minimally affect letter chart acuity, but may interfere significantly with reading and other activities.                                                                                                                                                                                                                                                                                                                         |
| <b>9D42.6</b>  | <b>Homonymous hemianopia or quadrant anopia</b><br>Homonymous, binocular field defects present the same or similar patterns in both eyes. They are caused by lesions of the retro-chiasmal pathways.                                                                                                                                                                                                                                                                                                                                |

## Vision impairment (9D90-9D9Z)

A vision impairment results when an eye condition affects the visual system and one or more of its vision functions. Typically, population-based surveys measure visual impairment using exclusively visual acuity, with severity categorized as mild, moderate or severe distance vision impairment or blindness, and near vision impairment. However, in the clinical setting, other visual functions are also often assessed, such as a person's field of vision, contrast sensitivity and colour vision.

### 9D90

### Vision impairment including blindness

The table below gives a classification of severity of vision impairment based on visual acuity. For epidemiological studies, it is recommended to collect the following information on visual acuity for each eye, for both eyes open and for distance and near.

- a. Uncorrected visual acuity
- b. Presenting visual acuity
- c. Best corrected visual acuity

Blindness is also categorized according to the degree of constriction of the central visual field in the better eye to less than 10 degrees.

For capturing and coding of "No vision impairment", use QA00.62 (QA00.6 Examination of eyes or vision).

| Category                     | Visual acuity *1                                                                                                |                                                                                                                  |

\*1 Presented in metres, decimals, feet and logMar

**Coded Elsewhere:** No vision impairment (QA00.62)

**9D90.1 Mild vision impairment**

**9D90.2 Moderate vision impairment**

**Inclusions:** visual impairment category 2, in both eyes

**9D90.3 Severe vision impairment**

**Inclusions:** visual impairment category 3 in one eye, with categories 1 or 2 in the other eye

**9D90.6 Blindness**

The numerical definition used for WHO statistics refers to profound, near-total or total loss. The functional definition refers to individuals who have little or no residual vision and who have to rely predominantly on vision substitution skills, i.e. on using senses other than vision (Braille or talking books for reading, a long cane or guide dog for mobility, or touch for manipulation).

**Inclusions:**

- visual impairment category 5
- visual impairment categories 4, 5, 6 in both eyes
- visual impairment categories 4, 5, 6 in one eye and categories 1, 2, 3 or 9 in the other eye
- visual impairment categories 4, 5, 6 in one eye [normal vision in other eye]

|               |                                                      |                                                                                                                                                                                                                                                                                                                                                       |
|---------------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>9D90.7</b> | <b>Near vision impairment</b>                        | Near vision refers to the ability to perform tasks that require detailed vision at a close distance. It should be measured with both eyes open at the subject's preferred viewing distance and with the subject's habitual near vision correction (if any). Near vision impairment is characterised by a presenting near visual acuity worse than N6. |
| <b>9D92</b>   | <b>Specific vision dysfunctions</b>                  | Specific visual dysfunctions refer to functional deficits in higher cerebral centres. Such dysfunctions may exist with or without visual impairment of the eyes and the lower visual system.                                                                                                                                                          |
| <b>9D93</b>   | <b>Complex vision-related dysfunctions</b>           | Complex Vision-Related Dysfunctions involve interactions with other sensory and motor systems. They reflect the combined effects at all stages of processing.                                                                                                                                                                                         |
| <b>9D94</b>   | <b>Impairment of presenting visual acuity</b>        |                                                                                                                                                                                                                                                                                                                                                       |
| <b>9D95</b>   | <b>Impairment of best corrected visual acuity</b>    |                                                                                                                                                                                                                                                                                                                                                       |
| <b>9D96</b>   | <b>Impairment of uncorrected visual acuity</b>       |                                                                                                                                                                                                                                                                                                                                                       |
| <b>9D9Y</b>   | <b>Other specified vision impairment</b>             |                                                                                                                                                                                                                                                                                                                                                       |
| <b>9D9Z</b>   | <b>Vision impairment, unspecified</b>                |                                                                                                                                                                                                                                                                                                                                                       |

| <b>9E1Z</b>   | <b>Diseases of the visual system, unspecified</b>    |                                                                                                                                                                                                                                                                                                                                                       |

# CHAPTER 10

---

## Diseases of the ear or mastoid process

This chapter has 78 four-character categories.

Code range starts with AA00

This chapter contains diseases of the ear and diseases of the mastoid process.

- Exclusions:**
- Complications of pregnancy, childbirth and the puerperium (Chapter 18)
  - Certain infectious or parasitic diseases (Chapter 01)
  - Certain conditions originating in the perinatal period (Chapter 19)
  - Injury, poisoning or certain other consequences of external causes (Chapter 22)
  - Neoplasms (Chapter 02)
  - Endocrine, nutritional or metabolic diseases (Chapter 05)
- Coded Elsewhere:**
- Structural developmental anomalies of the ear (LA20-LA2Z)
  - Symptoms, signs or clinical findings of ear or mastoid process (MC40-MC6Y)

This chapter contains the following top level blocks:

- Diseases of external ear
- Diseases of middle ear or mastoid
- Diseases of inner ear
- Disorders with hearing impairment
- Disorders of ear, not elsewhere classified
- Postprocedural disorders of ear or mastoid process

## Diseases of external ear (AA00-AA6Z)

**Coded Elsewhere:** Inflammatory disorders of the external ear (EG40-EG4Z)

### Infectious diseases of external ear (AA00-AA0Z)

**Coded Elsewhere:** Erysipelas of external ear (1B70.01)

Candida otomycosis (1F23.16)

Herpes simplex infection of external ear (1F00.0Y)

Otitis externa due to zoster (1E91.Y)

#### AA00

#### **Abscess of external ear**

A fluctuant collection of purulent exudate and necrotic tissue located in the external auditory canal or in the soft tissues of the pinna, most commonly due to *Staphylococcus aureus*.

#### AA01

#### **Cellulitis of external ear**

A diffuse subacute bacterial infection of the soft tissues of the external ear, most commonly due to beta-haemolytic streptococci. It may arise within an apparently healthy external ear but may complicate both inflammatory and infective forms of otitis externa.

**Exclusions:** Erysipelas of external ear (1B70.01)  
Staphylococcal cellulitis of skin (1B70.2)  
Streptococcal cellulitis of skin (1B70.1)

#### AA02

#### **Malignant otitis externa**

Malignant otitis externa is a rare life-threatening infective complication of otitis externa. It is due in the majority of cases to *Pseudomonas aeruginosa*. Organisms penetrate from the external ear canal into the surrounding deeper tissues resulting in osteomyelitis of the temporal bone and risks of damage to adjacent cranial nerves and septic thrombo-emboli to the brain. Advanced age, uncontrolled diabetes mellitus and immunosuppression are risk factors.

#### AA03

#### **Otomycosis**

Fungal infection of the ear. Otomycosis is due to *Aspergillus* spp., especially *A. niger*, in 75% or more of cases and *Candida* in most of the remainder.

**Coded Elsewhere:** *Aspergillus* otomycosis (1F20.10)  
*Candida* otomycosis (1F23.16)

#### AA04

#### **Perichondritis of external ear**

Perichondritis is an infection of the tissue surrounding the cartilage of the outer ear, the perichondrium. It usually results from injury to the ear from ear surgery, ear piercing (especially piercing of the cartilage), or trauma from contact sports. The most common bacterium causing perichondritis is *Pseudomonas aeruginosa*. Presenting features include pain, redness and swelling of the auricle, and fever.

#### AA0Y

#### **Other specified infectious diseases of external ear**

#### AA0Z

#### **Infectious diseases of external ear, unspecified**

## Otitis externa (AA10-AA3Z)

Inflammation of the outer ear including the external ear canal, cartilages of the auricle, and the tympanic membrane.

## Noninfectious inflammation of external ear (AA10-AA1Z)

**Coded Elsewhere:** Contact dermatitis of external ear (EG40)

Juvenile spring eruption (EJ30.0)

### AA10

#### Seborrhoeic otitis externa

Seborrhoeic dermatitis affecting the skin of the external ear. It is usually accompanied by evidence of seborrhoeic dermatitis at other sites. In mild cases it may be asymptomatic but it can present acutely with severe pain, oedema and exudation. Longstanding cases may be complicated by chronic lymphoedema and occlusion of the external auditory canal.

**Exclusions:** Seborrhoea (ED91.2)

### AA11

#### Acute noninfectious otitis externa

Rapid onset of eczematous inflammation of the outer ear the cause of which cannot be more precisely classified.

**Exclusions:** Acute seborrhoeic otitis externa (AA10)  
Allergic contact dermatitis of external ear (EG40.0)  
Irritant contact dermatitis of external ear (EK02.10)

### AA12

#### Chondrodermatitis nodularis

A common pressure-induced painful nodule or ulcer affecting the external ear. It results from ischaemia of skin and underlying cartilage from a focal point of high pressure from the weight of the recumbent head. The site of involvement is dependent on the shape of the pinna (most commonly the helix is involved but in some individuals it is the antihelix which is more prominent) and whether the sufferer is limited to sleeping on one side and is thus unable to spare the ear from constant pressure when lying in bed.

### AA13

#### Chronic otitis externa

#DRAFT# This is a chronic inflammatory dermatosis of the outer ear and ear canal.

### AA1Y

#### Other specified noninfectious inflammation of external ear

### AA1Z

#### Noninfectious inflammation of external ear, unspecified

---

### AA3Y

#### Other specified otitis externa

**Coding Note:** Code also the causing condition

### AA3Z

#### Otitis externa, unspecified

**Coding Note:** Code also the causing condition

Noninflammatory disorders of the external ear (AA40-AA4Z)

Miscellaneous noninflammatory disorders involving the external ear.

**Coded Elsewhere:** Ear-lobe keloid (EE60.00)

Acanthoma fissuratum (EH92.Y)

**AA40 Acquired deformity of external auditory canal**

**AA40.0 Exostosis of external auditory canal**

**AA40.1 Acquired stenosis of external auditory canal**

Acquired stenosis of external auditory canal was described as resulting from a number of different causes. Since then, histology and imaging studies of this disease have shown that a common cascade of inflammatory changes resulting from these different causes is the primary pathogenesis leading to medial canal fibrosis. Once there is complete obstruction of the external auditory canal, surgery is the primary treatment.

**AA40.2 Cholesteatoma of external auditory canal**

#DRAFT# This is a destructive and expanding growth consisting of an accumulation of keratinous debris within a cyst-like penetration of the bony portion of the external auditory canal wall. There is localised ulceration of the skin of the floor of the canal, with underlying osteitis and sometimes necrosis of bone.

**AA40.Y Other specified acquired deformity of external auditory canal**

**AA41 Acquired deformity of pinna**

Acquired deformities involving the external ear.

**Inclusions:** Acquired deformity of auricle

**AA41.0 Cauliflower ear**

Cauliflower ear is the end result of fibrosis of the skin and soft tissues of the pinna following a traumatic subperichondrial haematoma, usually due to trauma. It manifests as permanent swelling and deformity of the ear, described as resembling a cauliflower. It is found most commonly amongst men involved in contact sports such as boxing, wrestling, martial arts and rugby football.

**AA41.Y Other specified acquired deformity of pinna**

**AA42 Impacted cerumen**

Impacted cerumen is the presence of occlusive aural wax in the external ear canal. Wax may cause tinnitus or otalgia and removal may be required to allow adequate otoscopic examination and/or alleviate symptoms.

**AA4Y Other specified noninflammatory disorders of the external ear**

**AA4Z Noninflammatory disorders of the external ear, unspecified**

---

**AA6Z Diseases of external ear, unspecified**

## Diseases of middle ear or mastoid (AA80-AB1Z)

Middle ear, derived from the first pharyngeal (branchial) pouch; has the malleus and incus and stapes and includes the spaces of the epitympanum and mesotympanum and hypotympanum. The mastoid; normally contains "air"; the lateral boundary of the mesotympanum is where the tympanic membrane is, or normally would be located.

**Coded Elsewhere:** Congenital conductive hearing loss (AB50.0)

Otosclerosis (AB33)

Congenital mixed conductive and sensorineural hearing loss (AB50.2)

## Otitis media (AA80-AB0Z)

### Nonsuppurative otitis media (AA80-AA8Z)

#DRAFT# This is inflammation of the middle ear, or middle ear infection. It occurs in the area between the tympanic membrane and the inner ear, including a duct known as the eustachian tube.

#### AA80

#### **Acute serous or mucoid otitis media**

Acute serous or mucoid otitis media is a collection of non-infected fluid in the middle ear that has developed as a result of a upper respiratory infection.

#### AA81

#### **Acute nonserous nonsuppurative otitis media**

#DRAFT# This is most often purely viral and self-limited, as it usually accompanies viral URI (upper respiratory infection). There is congestion of the ears and perhaps mild discomfort and popping, but the symptoms resolve with the underlying URI.

**Exclusions:** Otitic barotrauma (NF04.0)

#### AA82

#### **Chronic serous or mucoid otitis media**

Chronic serous or mucoid otitis media is probably the most common form of sub-acute middle ear disease found in the developed world. It typically lingers following otitis media, when the fluid in the ear, formed by the infection, does not clear spontaneously. The tympanic membrane is intact but the middle ear is liquid- fluid filled. This presumably puts the middle ear at risk for further infection and often worsens hearing by about 30 dB. This is most frequently found in children and can interfere with language acquisition and learning.

#### AA83

#### **Noninfected otitis media with effusion**

#### AA8Z

#### **Nonsuppurative otitis media, unspecified**

## Suppurative otitis media (AA90-AA9Z)

This involves a perforation (hole) in the tympanic membrane and active bacterial infection within the middle ear space for several weeks or more. There may be enough pus that it drains to the outside of the ear (otorrhea), or the purulence may be minimal enough to only be seen on examination using a binocular microscope, unspecified.

### AA90

#### Acute suppurative otitis media

Acute suppurative otitis media is defined as an inflammation of the middle ear which erupts suddenly and passes quickly. It is characteristic to have a middle-ear infection behind a reddened eardrum.

### AA91

#### Chronic suppurative otitis media

##### AA91.0

##### Chronic tubotympanic suppurative otitis media

Having a tympanic membrane perforation for at least three months, chronic suppurative otitis media has traditionally been classified into safe and unsafe type. Chronic tubotympanic suppurative otitis media is considered "safe" (meaning it is unlikely to become a worse problem for the patient) if it involves a central perforation of the pars tensa with the inflammatory process affecting the mucosa of the middle ear cleft.

**Inclusions:** Benign chronic suppurative otitis media  
Chronic tubotympanic disease

##### AA91.1

##### Chronic atticoantral suppurative otitis media

Chronic suppurative otitis media has traditionally been classified into safe and unsafe type. Chronic atticoantral suppurative otitis media which is unsafe type is typified by a marginal perforation of the posterosuperior pars tensa or pars flaccida.

**Inclusions:** Chronic atticoantral disease

##### AA91.2

##### Other chronic suppurative otitis media

This involves a perforation (hole) in the tympanic membrane and active bacterial infection within the middle ear space for several weeks or more. There may be enough pus that it drains to the outside of the ear (otorrhea), or the purulence may be minimal enough to only be seen on examination using a binocular microscope.

##### AA91.Z

##### Chronic suppurative otitis media, unspecified

### AA9Z

#### Suppurative otitis media, unspecified whether acute or chronic

### AB00

#### Acute otitis media

**Coded Elsewhere:** Acute nonserous nonsuppurative otitis media (AA81)  
Acute suppurative otitis media (AA90)

### AB01

#### Chronic otitis media

**Coded Elsewhere:** Chronic serous or mucoid otitis media (AA82)  
Chronic suppurative otitis media (AA91)

### AB0Y

#### Other specified otitis media

**Coding Note:** Code also the causing condition

| <b>AB14</b>   | <b>Acute myringitis</b><br>Myringitis is the inflammation of the tympanic membrane, often involving painful blisters on the tympanic membrane. It can develop as self-maintained primary disease of the TM (primary myringitis) or as an effect of an inflammatory process of adjacent tissues of the external or middle ear (secondary myringitis). Myringitis may be accompanied by hearing impairment and a sensation of congestion and earache. It is generally a viral or bacterial infection and may occur with otitis media. After 3 weeks, acute myringitis becomes subacute and, within 3 months, chronic.<br><i>Inclusions:</i> Acute tympanitis<br><i>Exclusions:</i> Acute myringitis with otitis media (AB00) |

| <b>AB30</b>         | <b>Acute vestibular syndrome</b><br>A clinical syndrome of acute-onset, continuous vertigo, dizziness, or unsteadiness lasting days to weeks, and generally including features suggestive of new, ongoing vestibular system dysfunction (e.g., vomiting, nystagmus, severe postural instability). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Acute vestibular syndrome usually connotes a single, monophasic event, often caused by a one-time disorder, but it may instead punctuate a relapsing-and-remitting or stepwise, progressive illness course. Disorders typically presenting this syndrome include vestibular neuritis, acute labyrinthitis, traumatic vestibulopathy, demyelinating disease with vestibular involvement, and strokes affecting central or peripheral vestibular structures. |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>AB30.0</b>       | <b>Vestibular neuritis</b><br>Vestibular neuritis (also known as vestibular neuronitis) may be described as acute, sustained dysfunction of the peripheral vestibular system with secondary nausea, vomiting, and vertigo. Important negative features include aural fullness and hearing loss.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>AB30.1</b>       | <b>Labyrinthitis</b><br>Labyrinthitis is an inflammatory disorder of the inner ear (labyrinth) producing disturbances of balance and hearing to varying degrees. It can be caused by bacterial or viral infections and autoimmune processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>AB30.Y</b>       | <b>Other specified acute vestibular syndrome</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**AB31****Episodic vestibular syndrome**

A clinical syndrome of transient vertigo, dizziness, or unsteadiness lasting seconds to hours, occasionally days, and generally including features suggestive of temporary, short-lived vestibular system dysfunction (e.g., nausea, nystagmus, sudden falls). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Episodic vestibular syndrome usually connotes multiple, recurrent events caused by an episodic disorder with repeated spells (triggered or spontaneous), but may initially present after the first event.

**Coded Elsewhere:** Benign paroxysmal vertigo of childhood (8A80.Y)

**AB31.0****Meniere disease**

Meniere Disease (MD) is a chronic progressive inner ear disease, with endolymphatic hydrops. It is characterised by recurrent attacks of debilitating spontaneous vertigo lasting from 20 minutes to up to 12 hours, accompanied by a sense of fullness and tinnitus in the affected ear, and ipsilateral fluctuating sensorineural hearing loss (SNHL) in the low or low and middle frequencies. There may be nystagmus during attacks and falls are frequent. When known, etiology should be added.

**Inclusions:** Labyrinthine hydrops

**AB31.1****Vestibular migraine**

Recurrent attacks of moderate to severe vestibular symptoms lasting from 5 minutes to 72 hours in patients with a past or ongoing history of migraine headaches. Vestibular symptoms are usually spontaneous and positional vertigo, head motion-induced and visual vertigo as well as head motion-induced dizziness with nausea. Attacks of vestibular symptoms may occur together or independently of migraine symptoms like headache, photophobia, phonophobia or visual aura.

**AB31.2****Benign positional paroxysmal vertigo**

Benign paroxysmal positional vertigo is defined as an abnormal sensation of motion that is elicited by certain critical provocative physical positions of the patient (e.g. becoming dorsal recumbent). The provocative positions usually trigger specific eye movements (e.g. nystagmus). The character and direction of the nystagmus is specific to the part of the inner ear affected and the underlying pathophysiology.

**AB31.3****Superior canal dehiscence syndrome**

Superior canal dehiscence syndrome (SCDS) occurs when thin or dehiscent bone over the superior semicircular canal, best demonstrated on CT, allows pressure transmission between the canal and the intracranial space. Vertigo and nystagmus may occur when the canal is stimulated by loud sounds or changes in middle ear or intracranial pressure. Hyperacusis to bone-conducted sounds can cause conductive hearing loss, pulsatile tinnitus, or autophony (hearing one's own body sounds as loud or distorted). While the bony defect may be congenital, head trauma can be the final step that opens a functionally mobile labyrinthine window.

|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AB31.4</b> | <b>Disembarkment syndrome</b><br>Disembarkment syndrome, or Mal de débarquement (MdD) occurs when habituation to unfamiliar motion patterns like traveling on a boat, train, or airplane, becomes resistant to re-adaptation on return to stable conditions. It results in an illusion of self motion typically described as rocking, bobbing, or swaying. Brief periods of MdD (hours) are common in healthy individuals, this otherwise natural phenomenon can become persistent in some individuals.                                                                                                                                                                                      |
| <b>AB31.5</b> | <b>Autoimmune inner ear disease</b><br>Autoimmune inner ear disease (AIED) is a clinical syndrome of bilateral sensorineural hearing loss (SNHL) >30dB at one or more frequencies progressing over a period of 3-90 days. Progression of SNHL >15dB at one frequency or >10dB in two frequencies in at least one ear should be demonstrated. Vestibular symptoms may be present in 50% of patients and systemic autoimmune disease (SAD) coexists in 30% of patients.                                                                                                                                                                                                                        |
| <b>AB31.6</b> | <b>Vestibular paroxysmia</b><br>Vestibular paroxysmia (VP) is characterised by recurrent spells of vertigo or dizziness, lasting seconds to minutes, often many times a day. Attacks usually occur spontaneously but may occasionally be induced by changes of head position (which then needs to be distinguished from benign paroxysmal positioning vertigo). Possible accompanying symptoms are short attacks of tinnitus or changes in hearing. In the attack-free interval mild to moderate impairments of vestibular or audiological function may be found. Neurovascular cross-compression of the eighth nerve is the assumed mechanism.                                              |
| <b>AB31.7</b> | <b>Vertiginous syndromes</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>AB31.Z</b> | <b>Episodic vestibular syndrome, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>AB32</b>   | <b>Chronic vestibular syndrome</b><br>A clinical syndrome of chronic vertigo, dizziness, or unsteadiness lasting months to years and generally including features suggestive of persistent vestibular system dysfunction (e.g., oscillopsia, nystagmus, gait unsteadiness). There may also be symptoms or signs suggesting cochlear or central nervous system dysfunction. Chronic vestibular syndrome often connotes a progressive, deteriorating course, but sometimes instead reflects a stable, incomplete recovery after an acute vestibular event, or persistent, lingering symptoms between episodic vestibular events.                                                               |
| <b>AB32.0</b> | <b>Persistent Postural-Perceptual Dizziness</b><br>Persistent non-vertiginous dizziness, unsteadiness, or both lasting three months or more. Symptoms are present most days, often increasing throughout the day, but may wax and wane. Momentary flares may occur spontaneously or with sudden movement. Affected individuals feel worst when upright, exposed to moving or complex visual stimuli, and during active or passive head motion. These situations may not be equally provocative. Typically, the disorder follows occurrences of acute or episodic vestibular or balance-related problems. Symptoms may begin intermittently, and then consolidate. Gradual onset is uncommon. |
| <b>AB32.1</b> | <b>Chronic unilateral idiopathic vestibulopathy</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|               |                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>AB35</b>   | <b>Labyrinthine fistula</b><br>Labyrinthine fistula is a condition in which an abnormal communication is present between the perilymphatic space of the inner ear and the middle ear (usually at or adjacent to the round or oval window). The manifestations of this disease vary in severity and complexity, commonly ranging from very mild to incapacitating.                                    |
| <b>AB36</b>   | <b>Labyrinthine dysfunction</b>                                                                                                                                                                                                                                                                                                                                                                      |

**AB37****Noise effects on inner ear**

Noise toxicity can cause hearing loss, either transient or permanent, and impairment. Noise-induced hearing loss typically begins in the high-pitched frequency range of human voices communication.

**Inclusions:** Noise-induced hearing loss

**AB3Y****Other specified diseases of inner ear****AB3Z****Diseases of inner ear, unspecified**

## Disorders with hearing impairment (AB50-AB5Z)

**Exclusions:** Otosclerosis (AB33)

**AB50****Congenital hearing impairment**

Both dominant and recessive genes exist which can cause mild to profound impairment. If a family has a dominant gene for deafness it will persist across generations because it will manifest itself in the offspring even if it is inherited from only one parent. If a family had genetic hearing impairment caused by a recessive gene it will not always be apparent as it will have to be passed onto offspring from both parents. Hearing impairment is sustained before the acquisition of language, which occurs due to a congenital condition.

**AB50.0****Congenital conductive hearing loss****AB50.1****Congenital sensorineural hearing loss****AB50.2****Congenital mixed conductive and sensorineural hearing loss****AB50.Y****Other specified congenital hearing impairment****AB50.Z****Congenital hearing impairment, unspecified****AB51****Acquired hearing impairment**

Loss of hearing that occurs sometime the course of life and is not present at birth. The hearing impairment is sustained after the acquisition of language, which can occur due to disease, trauma, or as a side-effect of a medicine. Conductive hearing loss may occur as a result of a problem in the outer or middle ear such as an obstruction (cerumen, foreign body), damage to the ossicles, middle ear infections, and/or perforation of the tympanic membrane. Sensorineural hearing loss is a type of hearing loss in which the root cause lies in the vestibulocochlear nerve (Cranial nerve VIII), the inner ear, or central processing centres of the brain. Mixed conductive and sensorineural hearing loss refers to a mix of both conductive and sensorineural hearing loss.

**Exclusions:** noise-induced hearing loss (AB37)  
 Ototoxic hearing loss (AB53)  
 Sudden idiopathic hearing loss (AB55)  
 deafness NOS (AB52)  
 Deaf mutism, not elsewhere classified (AB50-AB5Z)

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Disorders of ear, not elsewhere classified (AB70-AB7Y)

**Exclusions:** Tinnitus (MC41)

### **AB70** Otolgia or effusion of ear

**Exclusions:** Otitis media (AA80-AB0Z)  
Chronic primary orofacial pain (MG30.03)  
Chronic secondary headache or orofacial pain (MG30.6)

### **AB70.0** Otorrhoea

**Exclusions:** leakage of cerebrospinal fluid through ear (8D63)  
Otorrhagia (AB70.1)

### **AB70.1** Otorrhagia

**Exclusions:** traumatic otorrhagia - code by type of injury (Chapter 22)

### **AB70.2** Ootalgia

Pain in one or both ears.

**Exclusions:** Chronic primary orofacial pain (MG30.03)  
Chronic secondary headache or orofacial pain (MG30.6)

### **AB71** Degenerative or vascular disorders of ear

**Exclusions:** Presbycusis (AB54)

### **AB72** Disorders of acoustic nerve

**Inclusions:** Disorder of 8th cranial nerve

### **AB72.0** Acoustic neuritis

**Coding Note:** Code also the causing condition

### **AB72.Y** Other specified disorders of acoustic nerve

### **AB72.Z** Disorders of acoustic nerve, unspecified

### **AB73** Atrophy ear

### **AB7Y** Other specified disorders of ear, not elsewhere classified

## Postprocedural disorders of ear or mastoid process (AB90-AB93)

### **AB90** Recurrent cholesteatoma of postmastoidectomy cavity

### **AB91** Mucosal cyst of postmastoidectomy cavity

### **AB92** Granulation of postmastoidectomy cavity

### **AB93** Chronic inflammation of postmastoidectomy cavity

# CHAPTER 11

---

## Diseases of the circulatory system

This chapter has 161 four-character categories.

Code range starts with BA00

This refers to diseases of the organ system that passes nutrients (such as amino acids, electrolytes and lymph), gases, hormones, blood cells, etc. to and from cells in the body to help fight diseases, stabilize body temperature and pH, and to maintain homeostasis.

**Exclusions:**

- Certain infectious or parasitic diseases (Chapter 01)
- Certain conditions originating in the perinatal period (Chapter 19)
- Congenital malformations, deformations and chromosomal abnormalities (Chapter 20)
- Complications of pregnancy, childbirth and the puerperium (Chapter 18)
- Injury, poisoning or certain other consequences of external causes (Chapter 22)
- Endocrine, nutritional or metabolic diseases (Chapter 05)

**Coded Elsewhere:**

- Neoplasms of the circulatory system
- Developmental anomalies of the circulatory system
- Infections of the circulatory system
- Symptoms, signs or clinical findings of the circulatory system (MC80-MC9Y)
- Cerebrovascular diseases (8B00-8B2Z)
- Functional vascular disorders of the skin (EG00-EG02)
- Diseases of the circulatory system complicating pregnancy, childbirth or the puerperium (JB64.4)

This chapter contains the following top level blocks:

- Hypertensive diseases
- Hypotension
- Ischaemic heart diseases
- Diseases of coronary artery
- Pulmonary heart disease or diseases of pulmonary circulation
- Pericarditis
- Acute or subacute endocarditis
- Heart valve diseases
- Diseases of the myocardium or cardiac chambers
- Cardiac arrhythmia

- Heart failure
- Diseases of arteries or arterioles
- Diseases of veins
- Disorders of lymphatic vessels or lymph nodes
- Postprocedural disorders of circulatory system
- Neoplasms of the circulatory system
- Developmental anomalies of the circulatory system
- Infections of the circulatory system

## Hypertensive diseases (BA00-BA04.Z)

Although a continuous association exists between higher BP and increased cardiovascular disease risk, it is useful to categorize BP levels for clinical and public health decision making. Recent guidelines categorise systemic hypertension into 4 levels on the basis of average BP measured in a healthcare setting (office pressures):

- Normal: systolic BP < 120 mmHg and diastolic BP < 80 mmHg
- Elevated: systolic BP 120-129 mmHg and diastolic BP < 80 mmHg
- Stage 1 hypertension: systolic BP 130-139 mmHg or diastolic BP 80-89 mmHg
- Stage 2 hypertension: systolic BP 140 mmHg or more, diastolic BP 90 mmHg or more

In children, systemic hypertension is defined as an average systolic or diastolic blood pressure equal or higher than the 95th percentile appropriate for the sex, age and height of the child.

The complications of uncontrolled or prolonged hypertension include damage to the blood vessels, heart, kidneys and brain.

**Exclusions:** Pulmonary hypertension (BB01)  
involving coronary vessels (BA40-BA6Z)  
Oedema, proteinuria, or hypertensive disorders in pregnancy, childbirth, or the puerperium (JA20-JA2Z)  
White coat hypertension (MC80.00)

**Coded Elsewhere:** Neonatal hypertension (KB45)

### BA00

#### Essential hypertension

Essential (primary) hypertension, accounting for 95% of all cases of hypertension, is defined as high blood pressure for which a secondary cause cannot be found.

**Inclusions:** high blood pressure

**Exclusions:** Cerebrovascular diseases (8B00-8B2Z)  
Background retinopathy and retinal vascular changes (9B78.1)

**Coded Elsewhere:** Pre-existing essential hypertension complicating pregnancy, childbirth or the puerperium (JA20.0)

### BA00.0

#### Combined diastolic and systolic hypertension

|               |                                               |
|---------------|-----------------------------------------------|
| <b>BA00.1</b> | <b>Isolated diastolic hypertension</b>        |
| <b>BA00.2</b> | <b>Isolated systolic hypertension</b>         |
| <b>BA00.Y</b> | <b>Other specified essential hypertension</b> |
| <b>BA00.Z</b> | <b>Essential hypertension, unspecified</b>    |

## **BA01**

### **Hypertensive heart disease**

Uncontrolled and prolonged hypertension can lead to a variety of changes in the myocardial structure, coronary vasculature, and conduction system of the heart. Hypertensive heart disease is a term applied generally to heart diseases, such as left ventricular hypertrophy, coronary artery disease, cardiac arrhythmias, and congestive heart failure, that are caused by direct or indirect effects hypertension.

**Coded Elsewhere:** Pre-existing hypertensive heart disease complicating pregnancy, childbirth or the puerperium (JA20.1)

Pre-existing hypertensive heart and renal disease complicating pregnancy, childbirth or the puerperium (JA20.3)

## **BA02**

### **Hypertensive renal disease**

Hypertensive renal disease is a medical condition referring to damage to the kidney due to chronic high blood pressure.

**Inclusions:** hypertensive nephropathy

**Exclusions:** Secondary hypertension (BA04)

**Coded Elsewhere:** Pre-existing hypertensive renal disease complicating pregnancy, childbirth or the puerperium (JA20.2)

Pre-existing hypertensive heart and renal disease complicating pregnancy, childbirth or the puerperium (JA20.3)

## **BA03**

### **Hypertensive crisis**

#DRAFT# This is severe hypertension (high blood pressure) with acute impairment of one or more organ systems (especially the central nervous system, cardiovascular system and/or the renal system) that can result in irreversible organ damage.

**Coding Note:** Code also the causing condition

## **BA04**

### **Secondary hypertension**

Defined through the measurement of the blood pressure using cuff method with a sitting systolic blood pressure above 140 mmHg or a sitting diastolic blood pressure above 90 mmHg in three consequent measurements with an identifiable cause.

**Coding Note:** Code also the causing condition

**Exclusions:** involving vessels of brain (8B00-8B2Z)

involving vessels of eye (9B78.1)

**Coded Elsewhere:** Congenital renal artery stenosis (LA90.40)

Hyperaldosteronism (5A72)

Pre-existing secondary hypertension complicating pregnancy, childbirth or the puerperium (JA20.4)

|                     |                                                               |
|---------------------|---------------------------------------------------------------|
| <b>BA04.0</b>       | <b>Combined diastolic and systolic secondary hypertension</b> |
| <b>BA04.1</b>       | <b>Isolated diastolic secondary hypertension</b>              |
| <b>BA04.2</b>       | <b>Isolated systolic secondary hypertension</b>               |
| <b>BA04.Y</b>       | <b>Other specified secondary hypertension</b>                 |
| <b>Coding Note:</b> | Code also the causing condition                               |
| <b>BA04.Z</b>       | <b>Secondary hypertension, unspecified</b>                    |
| <b>Coding Note:</b> | Code also the causing condition                               |

## Hypotension (BA20-BA2Z)

|                         |                                                 |
|-------------------------|-------------------------------------------------|
| <b>Exclusions:</b>      | cardiovascular collapse (MG40)                  |
|                         | Nonspecific low blood-pressure reading (MC80.1) |
|                         | Maternal hypotension syndrome (JA65.6)          |
| <b>Coded Elsewhere:</b> | Intracranial hypotension (8D61)                 |
|                         | Neonatal hypotension (KB46)                     |

|             |                                                 |
|-------------|-------------------------------------------------|
| <b>BA20</b> | <b>Idiopathic hypotension</b>                   |
| <b>BA21</b> | <b>Orthostatic hypotension</b>                  |
|             | <b>Exclusions:</b> Shy-Drager syndrome (8D87.0) |
| <b>BA2Y</b> | <b>Other specified hypotension</b>              |
| <b>BA2Z</b> | <b>Hypotension, unspecified</b>                 |

## Ischaemic heart diseases (BA40-BA6Z)

#DRAFT# This is most commonly caused by obstruction of coronary arteries by atheromatous plaque, but the obstruction may also be a nonatherosclerosis cause. A sudden cessation of perfusion leads to the aerobic metabolism, depletion of creatine phosphate, and onset of anaerobic glycolysis. Transient coronary occlusion resulting from coronary vasospasm or transient thrombosis is called supply-induced ischaemia. An inability to increase flow in response to increases in myocardial oxygen consumption is called demand-induced ischemia. Chest discomfort is usually the predominant symptom in stable angina, unstable angina, variant angina, microvascular angina and acute myocardial infarction. However, presentations of this disease also occurred without chest discomfort.

### Acute ischaemic heart disease (BA40-BA4Z)

**Inclusions:** acute coronary syndrome

#### **BA40**

#### **Angina pectoris**

#DRAFT# This is a discomfort in the chest or adjacent areas caused by myocardial ischemia. It is usually brought on by exertion and is associated with a disturbance in myocardial function. The typical episode of this disease usually begins gradually and reaches its maximum intensity over a period minutes before dissipating. The discomfort is relieved within minutes by rest or the use of nitroglycerin.

**Inclusions:** Anginal syndrome  
Ischaemic chest pain  
Angina NOS

**Exclusions:** Otocephaly (LA23)

**Coded Elsewhere:** Microvascular angina (BA86)

#### **BA40.0**

#### **Unstable angina**

#DRAFT# This is defined as angina pectoris with at least one of three features: (1) occurring at rest or minimum exertion and usually lasting over 20 minutes (if not interrupted by the administration of a nitrate or an analgesic); (2) being severe and usually described as frank pain; or (3) occurring with a crescendo pattern.

**Inclusions:** Preinfarction syndrome  
worsening effort angina

#### **BA40.1**

#### **Stable angina**

#DRAFT# This is a discomfort in the chest or adjacent areas and usually brought on by exertion and is associated with a disturbance in myocardial function. The typical episode of this disease usually begins gradually and reaches its maximum intensity over a period minutes before dissipating. The discomfort is relieved within minutes by rest or the use of nitroglycerin.

#### **BA40.Y**

#### **Other specified angina pectoris**

#### **BA40.Z**

#### **Angina pectoris, unspecified**

**BA41****Acute myocardial infarction**

The term acute myocardial infarction (MI) should be used when there is evidence of myocardial necrosis in a clinical setting consistent with acute myocardial ischemia. Under these conditions any one of the following criteria meets the diagnosis for MI;

Detection of a rise and/or fall of cardiac biomarker values with at least one value above the 99th percentile upper reference limit and with at least one of the following;

- a. Symptoms of ischaemia.
- b. New or presumed new significant ST-segment-T wave (ST-T) changes or new left bundle branch block (LBBB) in the electrocardiogram (ECG).
- c. Development of pathologic Q waves in the electrocardiogram (ECG).
- d. Imaging evidence of new loss of viable myocardium or new regional wall motion abnormality.
- e. Identification of an intracoronary thrombus by angiography or autopsy.

Infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction (WHO)

**Exclusions:**

- postmyocardial infarction syndrome (BA60.0)
- Subsequent myocardial infarction (BA42)
- Certain current complications following acute myocardial infarction (BA60)
- Old myocardial infarction (BA50)

**BA41.0****Acute ST elevation myocardial infarction**

STEMI is an acute myocardial infarction with developing ST elevation in two contiguous leads. The criteria of ST elevation are as follows: New ST elevation at the J point in two contiguous leads where these cut points apply: 0.2mV in men > 40 years, > 0.25mV in men < 40 years, and > 0.15 mV in women.

**BA41.1****Acute non-ST elevation myocardial infarction****BA41.Z****Acute myocardial infarction, unspecified****BA42****Subsequent myocardial infarction**

Infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction

**Inclusions:**

- extension of myocardial infarction
- recurrent myocardial infarction

**Exclusions:**

- specified as chronic or with a stated duration of more than 4 weeks (more than 28 days) from onset (BA50)

**BA42.0****Subsequent myocardial infarction, ST elevation myocardial infarction**

Extension or recurrent myocardial infarction. This category should be assigned for infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction. This most commonly results from total occlusion of the culprit coronary artery.

**BA42.1**      **Subsequent myocardial infarction, non-ST elevation myocardial infarction**  
Extension or recurrent myocardial infarction. For morbidity coding, this category should be assigned for infarction of any myocardial site, occurring within 4 weeks (28 days) from onset of a previous infarction. This most commonly results from severe obstruction, but not total occlusion, of the culprit coronary artery.

**BA42.Z**      **Subsequent myocardial infarction, unspecified**

**BA43**      **Coronary thrombosis not resulting in myocardial infarction**  
Superimposed thrombus associated with plaque rupture or erosion which does not obstruct the coronary flow to cause myocardial infarction.

**Inclusions:**      Occlusion of coronary artery or vein not resulting in myocardial infarction  
Embolism of coronary artery or vein not resulting in myocardial infarction  
Thromboembolism of coronary artery or vein not resulting in myocardial infarction

**BA4Z**      **Acute ischaemic heart disease, unspecified**

Chronic ischaemic heart disease (BA50-BA5Z)

Chronic heart disease is seen due to the atherosclerosis of coronary arteries. It is characterised by angina pectoris and unstable angina.

**BA50**      **Old myocardial infarction**  
Past myocardial infarction diagnosed by electrocardiogram (ECG) or other special investigation, but currently presenting no symptoms.

**Inclusions:**      healed myocardial infarction

**BA51**      **Ischaemic cardiomyopathy**  
Ischaemic cardiomyopathy has been defined as left ventricular systolic dysfunction with one or more of the following: a history of prior myocardial revascularisation or myocardial infarction, more than 75% stenosis in the left main stem or left anterior descending artery, or two vessels or more with a greater than 75% stenosis. It consists of a spectrum of pathophysiological states that relate to perfusion contraction matching and mismatching, including myocardial infarction, stunning, hibernation and scarring.

**BA51.0**      **Dilated cardiomyopathy due to congenital anomaly of coronary artery**  
Dilated cardiomyopathy due to a congenital anomaly of one or more coronary arteries, such as anomalous left coronary artery from pulmonary artery (ALCAPA), coronary ostial stenosis or atresia, right ventricular dependent coronary circulation in pulmonary atresia with an intact ventricular septum. It is a form of ischaemic cardiomyopathy causing systolic ventricular dysfunction that relates to a spectrum of perfusion contraction matching and mismatching, including myocardial infarction, stunning, hibernation and scarring.

**BA51.Y**      **Other specified ischaemic cardiomyopathy**

|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BA60.0</b> | <b>Dressler syndrome</b><br>A condition of postmyocardial infarction (1 to 8 weeks), characterised by a set of associated symptom, including malaise, fever, pericardial discomfort, leukocytosis, an elevated sedimentation rate, and a pericardial effusion. Patients with this syndrome usually demonstrate localised fibrous pericarditis containing polymorphonuclear leukocytes.<br><i>Inclusions:</i> Postmyocardial infarction syndrome                                                                                                                                                                                                                                                      |
| <b>BA60.1</b> | <b>Other pericarditis as current complication following acute myocardial infarction</b><br>An inflammation of the pericardium that can produce chest pain, which occurs as early as the first day and as late as 6 weeks after acute myocardial infarction. The pain of pericarditis radiates to either trapezius ridge. Transmural myocardial infarction is responsible for local pericardial inflammation. Transient pericardial friction rubs are relatively common in patients with transmural infarction within the first 48 hours. An acute fibrinous pericarditis occurs commonly after transmural infarction, whereas the risk of haemorrhagic pericarditis is increased by anticoagulation. |
| <b>BA60.2</b> | <b>Ventricular aneurysm as current complication following acute myocardial infarction</b><br>A discrete dyskinetic area of the left ventricular wall with a broad neck after acute myocardial infarction. The wall of the true aneurysm is thinner than the rest of the left ventricle; it is usually composed of fibrous tissue and necrotic muscle, occasionally mixed with viable myocardium. In contrast, pseudoaneurysms are composed of organised hematoma and pericardium and lack any elements of the original myocardial wall.                                                                                                                                                              |
| <b>BA60.3</b> | <b>Ventricular septal defect as current complication following acute myocardial infarction</b><br>A mechanical rupture of the interventricular septum after ST elevation myocardial infarction resulting in the left-to-right shunt to deteriorate hemodynamic, which confers a high 30-day mortality. Rupture of the septum with an anterior infarction tends to be apical in location, whereas inferior infarctions are associated with perforation of the basal septum.                                                                                                                                                                                                                           |
| <b>BA60.4</b> | <b>Cardiac rupture as current complication following acute myocardial infarction</b><br>A tearing of acutely infarcted tissue after acute myocardial infarction, which may involve the papillary muscles, interventricular septum, or free wall of either ventricle.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>BA60.5</b> | <b>Pulmonary embolism as current complication following acute myocardial infarction</b><br>A pulmonary embolism that resulted from thrombi in the veins of the lower extremities (e.g. after prolonged periods of bed rest) or mural thrombi overlying an area of right ventricular infarction after acute myocardial infarction.<br><i>Exclusions:</i> Mural thrombus as current complication following acute myocardial infarction (BA60.7)                                                                                                                                                                                                                                                        |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BA60.6</b> | <b>Rupture of papillary muscle or chordae tendineae as current complication following acute myocardial infarction</b><br>#DRAFT# Rupture of the myocardium after acute myocardial infarction that involves the papillary muscle or chordae tendineae. These manifest a new systolic murmur and acute left ventricular failure due to massive regurgitation of mitral valves.                                                                                                                 |
| <b>BA60.7</b> | <b>Mural thrombus as current complication following acute myocardial infarction</b><br>A blood clot formed on the endoventricle or endoatrium, usually overlying dyskinetic or akinetic area of the ventricular infarction after acute myocardial infarction.<br><b>Exclusions:</b> Pulmonary embolism as current complication following acute myocardial infarction (BA60.5)                                                                                                                |
| <b>BA60.8</b> | <b>Arrhythmia as current complication following acute myocardial infarction</b><br>A large and heterogeneous group of conditions in which the heart beats with an irregular or abnormal rhythm that can complicate the course of patients with acute myocardial infarction.                                                                                                                                                                                                                  |
| <b>BA60.9</b> | <b>Cardiogenic shock, unrelated to mechanical complications, as current complication following acute myocardial infarction</b><br>The most severe clinical expression of left ventricular failure and is associated with extensive damage to the left ventricular myocardium after acute myocardial infarction, unrelated to a mechanical defect such as ventricular septal or papillary muscle rupture. Shock is defined as systolic blood pressure (BP) < 90 mmHg and organ hypoperfusion. |
| <b>BA60.Y</b> | <b>Other specified current complications following acute myocardial infarction</b>                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>BA60.Z</b> | <b>Certain current complications following acute myocardial infarction, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                      |

**BA82****Coronary artery dissection**

Coronary artery dissection results from a tear in the inner layer of the coronary artery, the tunica intima. This allows blood to penetrate and cause an intramural hematoma in the central layer, the tunica media, and restriction in the size of lumen.

**Inclusions:** spontaneous coronary artery dissection

**Exclusions:** Injury or harm arising from a procedure, not elsewhere classified (NE81)

Injury of blood vessels of thorax (NB30)

**BA83****Coronary artery fistula, acquired**

Abnormal communication between a coronary artery and a cardiac chamber or major vessels, acquired after coronary or heart surgery, coronary angioplasty, rupture or coronary artery aneurysm or injury to the heart.

**BA84****Chronic total occlusion of coronary artery**

A chronic total occlusion of coronary artery is defined as the complete obstruction of a coronary artery or coronary arteries, exhibiting a TIMI flow score of zero or one, with an occlusion duration of greater than 3 months.

**Coding Note:** Code also the causing condition

**Exclusions:** Acute myocardial infarction (BA41)

**BA85****Coronary vasospastic disease**

The term coronary vasospastic disease refers to a sudden, intense vasoconstriction of an epicardial coronary artery that causes vessel occlusion or near occlusion. Although it may be involved in other coronary syndromes, it represents the usual cause of variant angina.

**BA85.0****Silent coronary vasospastic disease**

The feature of this is the frequency of asymptomatic ischemic episodes in coronary vasospastic disease.

**BA85.Y****Other specified coronary vasospastic disease****BA85.Z****Coronary vasospastic disease, unspecified****BA86****Coronary microvascular disease****BA8Y****Other specified diseases of coronary artery****BA8Z****Diseases of coronary artery, unspecified**

## Pulmonary heart disease or diseases of pulmonary circulation (BB00-BB0Z)

#DRAFT# This is enlargement of the right ventricle of the heart as a response to increased resistance or high blood pressure in the lungs (pulmonary hypertension), and diseases of pulmonary circulation.

### BB00

#### **Pulmonary thromboembolism**

#DRAFT# This is a blockage of the main artery of the lung or one of its branches by a substance that has travelled from elsewhere in the body through the bloodstream (embolism).

**Exclusions:** Complications following abortion, ectopic or molar pregnancy (JA05)

Diseases of the circulatory system complicating pregnancy, childbirth or the puerperium (JB64.4)

### BB00.0

#### **Acute pulmonary thromboembolism**

Acute pulmonary thromboembolism is defined as a partial or complete occlusion of a pulmonary arterial branch with the abrupt onset of related symptoms, such as dyspnoea, tachypnoea, chest pain, cough and blood-tinged sputum. However, acute pulmonary embolism may also occur in the absence of any symptoms.

### BB00.1

#### **Chronic pulmonary thromboembolism**

Chronic pulmonary thromboembolism is defined as a partial or complete occlusion of at least one major pulmonary arterial branch in the presence of a mean pulmonary artery pressure 25mmHg at rest, and normal left ventricular filling pressures, despite effective coagulation over at least three months.

**Coded Elsewhere:** Chronic thromboembolic pulmonary hypertension (BB01.3)

### BB00.Z

#### **Pulmonary thromboembolism, unspecified**

### BB01

#### **Pulmonary hypertension**

Pulmonary hypertension (PH) is a haemodynamic and pathophysiological condition defined as an increase in mean pulmonary arterial pressure (PAP) 25 mmHg at rest as assessed by right heart catheterization. PH can be found in multiple clinical conditions.

**Coded Elsewhere:** Persistent pulmonary hypertension of the newborn (KB42)

### BB01.0

#### **Pulmonary arterial hypertension**

Pulmonary arterial hypertension is a clinical condition characterised by the presence of pre-capillary pulmonary hypertension in the absence of other causes of pre-capillary pulmonary hypertension, such as due to lung diseases, chronic thromboembolic pulmonary hypertension, or other rare diseases. It includes different forms that share a similar clinical picture and virtually identical pathological changes of the lung microcirculation.

**Inclusions:** primary pulmonary hypertension

### BB01.1

#### **Pulmonary hypertension due to left heart disease**

#DRAFT# This is an increase of blood pressure in the pulmonary artery, pulmonary vein, or pulmonary capillaries, together known as the lung vasculature, leading to shortness of breath, dizziness, fainting, and other symptoms, all of which are exacerbated by exertion, due to left heart disease.

|                     |                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BB01.2</b>       | <b>Pulmonary hypertension due to lung disease or hypoxia</b><br>#DRAFT# This is an increase of blood pressure in the pulmonary artery, pulmonary vein, or pulmonary capillaries, together known as the lung vasculature, leading to shortness of breath, dizziness, fainting, and other symptoms, all of which are exacerbated by exertion, due to lung disease and/or hypoxia.            |
| <b>BB01.3</b>       | <b>Chronic thromboembolic pulmonary hypertension</b><br>Chronic thromboembolic pulmonary hypertension (CTEPH) is characterised by the persistence of thromboemboli in the form of organised tissue obstructing the pulmonary arteries. The consequence is an increase in pulmonary vascular resistance (PVR) resulting in pulmonary hypertension (PH) and progressive right heart failure. |
| <b>BB01.4</b>       | <b>Pulmonary hypertension with multifactorial mechanism</b><br>#DRAFT# This is an increase of blood pressure in the pulmonary artery, pulmonary vein, or pulmonary capillaries, together known as the lung vasculature, leading to shortness of breath, dizziness, fainting, and other symptoms, all of which are exacerbated by exertion, with unclear and/or multifactorial mechanism.   |
| <b>Coding Note:</b> | Code also the causing condition                                                                                                                                                                                                                                                                                                                                                            |
| <b>BB01.5</b>       | <b>Cor pulmonale</b><br>Cor pulmonale refers to the altered structure and/or impaired function of the right ventricle that results from pulmonary hypertension associated with diseases of the lung, upper airway, or chest wall.                                                                                                                                                          |

## Heart valve diseases (BB60-BC0Z)

#DRAFT# This is any disease process involving one or more of the valves of the heart (the aortic and mitral valves on the left and the pulmonary and tricuspid valves on the right).

**Exclusions:** Congenital anomaly of a ventriculo-arterial valve or adjacent regions (LA8A)  
Atypical truncal valve (LA85.4)  
Acute rheumatic fever (1B40-1B42)  
Structural developmental anomalies of the circulatory system (LA80-LA9Z)

### Mitral valve disease (BB60-BB6Z)

This is a disorder of the heart in which the mitral valve does not close properly when the heart pumps out blood. It is the abnormal leaking of blood from the left ventricle through the mitral valve into the left atrium when the left ventricle contracts. Simply put, there is regurgitation of blood back into the left atrium.

**Exclusions:** Congenital anomaly of mitral valve (LA87.1)

**Coded Elsewhere:** Injury to mitral valve (NB31.40)

#### **BB60** Mitral valve stenosis

**Exclusions:** Mitral valve stenosis with insufficiency (BB63)

**Coded Elsewhere:** Postprocedural mitral valve stenosis (BE12.0)

#### **BB60.0** Rheumatic mitral valve stenosis

Mitral stenosis refers to narrowing of the mitral valve orifice, resulting in impedance of filling of the left ventricle in diastole. It is usually caused by rheumatic heart disease.

#### **BB60.1** Nonrheumatic mitral valve stenosis

Mitral stenosis is narrowing of the passage through the mitral valve due to fibrosis, and calcinosis in the leaflets and chordal areas.

The most common reason of mitral stenosis is rheumatic fever. Except rheumatic fever; SLE, Malignant Sarcoid, Active Infective Endocarditis, Gout Whipple's Disease, Massive Annular calcification cause to the mitral stenosis.

**Exclusions:** Postprocedural mitral valve stenosis (BE12.0)

#### **BB60.Z** Mitral valve stenosis, unspecified

#### **BB61** Mitral valve insufficiency

Mitral insufficiency is a clinical condition which mitral valve can't close properly. It is the antidromic leaking of blood from the left ventricle through the mitral valve, and into the left atrium.

**Exclusions:** Mitral valve stenosis with insufficiency (BB63)

**Coded Elsewhere:** Postprocedural mitral valve insufficiency (BE12.1)

Mitral valve insufficiency due to acute myocardial infarction (BA60.6)

| <b>BB6Z</b>   | <b>Mitral valve disease, unspecified</b>                                                                                                                                                                                                                                                                              |

Aortic valve disease (BB70-BB7Z)

**Exclusions:** Congenital anomaly of aortic valve (LA8A.2)

**Coded Elsewhere:** Traumatic injury to aortic valve (NB31.4Y)

Dysplasia of aortic valve (LA8A.2Y)

## **BB70**

### **Aortic valve stenosis**

Aortic valve stenosis is abnormal narrowing of the aortic valve. This decreases the blood flow from heart to organs.

**Exclusions:** Congenital supraaortic stenosis (LA8A.3)

Congenital subaortic stenosis (LA8A.5)

**Coded Elsewhere:** Postprocedural aortic valve stenosis (BE12.2)

## **BB70.0**

### **Rheumatic aortic valve stenosis**

Aortic stenosis caused by scarring of the aortic valve due to rheumatic fever as a child or young adult. In aortic stenosis, the aortic valve does not open fully. This decreases blood flow from the heart.

## **BB70.1**

### **Nonrheumatic aortic valve stenosis**

**Exclusions:** Postprocedural aortic valve stenosis (BE12.2)

**Coded Elsewhere:** Stenosis of the neo-aortic valve of pulmonary origin (BC02.30)

## **BB70.Y**

### **Other specified aortic valve stenosis**

## **BB70.Z**

### **Aortic valve stenosis, unspecified**

## **BB71**

### **Aortic valve insufficiency**

Aortic valve insufficiency results from leakage and backflow of blood that is ejected from the left ventricle into the ascending aorta back into the left ventricle.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Postprocedural aortic valve insufficiency (BE12.3)

Insufficiency of the neo-aortic valve of pulmonary origin  
(BC02.31)

## **BB71.0**

### **Rheumatic aortic valve insufficiency**

Aortic insufficiency is the leaking of the aortic valve of the heart that causes blood to flow in the reverse direction during ventricular diastole, from the aorta into the left ventricle. Rheumatic fever causes the valve cusps to retract.

**Inclusions:** rheumatic aortic incompetence

rheumatic aortic regurgitation

**Exclusions:** Active or acute rheumatic endocarditis of aortic valve (1B41.1)

## **BB71.Y**

### **Other specified nonrheumatic aortic valve insufficiency**

**Coding Note:** Code also the causing condition

## **BB71.Z**

### **Aortic valve insufficiency, unspecified**

**Coding Note:** Code also the causing condition

**BC02****Acquired abnormality of congenitally malformed valve**

A postnatal pathological change in form or function of a congenitally malformed valve.

**Exclusions:** Congenital anomaly of aortic valve (LA8A.2)  
Congenital anomaly of mitral valve (LA87.1)  
Congenital anomaly of pulmonary valve (LA8A.0)  
Congenital anomaly of tricuspid valve (LA87.0)

**Coded Elsewhere:** Endocarditis of common atrioventricular valve (BB40)  
Endocarditis of right atrioventricular valve (BB40)  
Endocarditis of left atrioventricular valve (BB40)  
Endocarditis of the neo-aortic valve of pulmonary origin (BB40)  
Endocarditis of neopulmonary valve (BB40)

**BC02.0 Acquired common atrioventricular valvar abnormality in biventricular connections**

A postnatal pathological change in form or function of the common atrioventricular valve in the presence of biventricular atrioventricular connections.

**BC02.1 Acquired truncal valvar abnormality**

A postnatal pathological change in form or function of the truncal valve when the truncal valve supplies both the systemic and pulmonary circulations.

**Coded Elsewhere:** Endocarditis of truncal valve or neo-aortic valve of truncal origin (BB40)

**BC02.2 Acquired common atrioventricular valvar abnormality in double inlet ventricle**

**Coded Elsewhere:** Postprocedural common atrioventricular valvar abnormality in double-inlet ventricle (BE14.7)

Postprocedural right-sided atrioventricular valvar abnormality in double-inlet ventricle (BE14.5)

Postprocedural left-sided atrioventricular valvar abnormality in double-inlet ventricle (BE14.6)

**BC02.3 Acquired abnormality of neo-aortic valve of pulmonary origin****BC02.30 Stenosis of the neo-aortic valve of pulmonary origin**

Acquired obstruction to flow through the neo-aortic valve of pulmonary origin, that is, the native pulmonary valve that has become the functional neo-aortic valve.

Examples of hearts in which a neo-aortic valve has been created include the aortopulmonary anastomosis (Damus-Kaye-Stansel, Norwood procedures), pulmonary valve autograft (Ross procedure), and arterial switch operation

**BC02.31 Insufficiency of the neo-aortic valve of pulmonary origin**

Acquired backward flow through the neo-aortic valve of pulmonary origin, that is, the native pulmonary valve that has become the functional neo-aortic valve.

Examples of hearts in which a neo-aortic valve has been created include the aortopulmonary anastomosis (Damus-Kaye-Stansel, Norwood procedures), pulmonary valve autograft (Ross procedure), and arterial switch operation.

| <b>BC20.1</b> | <b>Rheumatic heart disease, unspecified</b><br>#DRAFT# This is an inflammatory disease that occurs following a <i>Streptococcus pyogenes</i> infection, such as streptococcal pharyngitis or scarlet fever. Believed to be caused by antibody cross-reactivity that can involve the heart, joints, skin, and brain, the illness typically develops two to three weeks after a streptococcal infection, unspecified. |

## Diseases of the myocardium or cardiac chambers (BC40-BC4Z)

This refers to diseases of a type of involuntary striated muscle found in the walls and histological foundation of the heart, with specific reference to the atrial and ventricular chambers, as well as the myocardium itself.

|               |                                                                                                                                                                                                                                                                                                                         |

**BC42****Myocarditis**

Myocarditis (inflammatory cardiomyopathy) is inflammation of the heart muscle generally in the presence of a dilated cardiomyopathy that results from exposure to either discrete infectious external antigens such as viruses, bacteria, fungal or parasites; non-infectious external antigens such as hypersensitivity to drugs; or internal non-infectious triggers such as autoimmune or hypersensitive activation against self-antigens.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Acute rheumatic myocarditis (1B41.2)

Sarcoid myocarditis (4B20.Y)

Loeffler endocarditis (BC43.20)

**BC42.0****Giant cell myocarditis**

Giant cell myocarditis is a form of dilated cardiomyopathy secondary to myocardial inflammation that is characterised by widespread infiltration of giant cells (abnormal masses produced by the fusion of macrophages) associated with other inflammatory cells and heart muscle cell destruction.

**BC42.1****Infectious myocarditis**

Infectious myocarditis (infectious inflammatory cardiomyopathy) is inflammation of the heart muscle generally in the presence of a dilated cardiomyopathy that results from exposure to discrete infectious external antigens such as a virus, bacteria or parasite.

**Coding Note:** Code also the causing condition

**Exclusions:** Acute rheumatic myocarditis (1B41.2)

Myoendocarditis (BB41)

Acute or subacute infectious endocarditis (BB40)

**BC42.2****Hypersensitivity myocarditis**

Hypersensitivity myocarditis is the presence of dilated cardiomyopathy in association with a known related disorder (hypereosinophilic syndrome (usually a restrictive cardiomyopathy), Churg-Strauss syndrome, malignancy, parasite infection, drugs, or vaccines) and findings of interstitial lymphocytic and eosinophilic infiltration, giant cell, and possible myocardial necrosis on biopsy, usually with peripheral eosinophilia.

**Inclusions:** eosinophilic myocarditis

**BC42.3****Rheumatic myocarditis**

Rheumatic myocarditis is cardiac inflammation and scarring triggered by an autoimmune reaction to group A streptococci infection resulting acutely in pancarditis involving inflammation of the myocardium, endocardium, and epicardium and chronically by valve fibrosis.

**Coding Note:** Code also the causing condition

**BC42.Y****Other specific myocarditis**

**Coding Note:** Code also the causing condition

**BC42.Z Myocarditis, unspecified**

**Coding Note:** Code also the causing condition

**BC43**

**Cardiomyopathy**

These are myocardial disorders in which the heart muscle is structurally and functionally abnormal, in the absence of coronary artery disease, hypertension, valvular disease and congenital heart disease sufficient to cause the observed myocardial abnormality.

**Coding Note:** Code also the causing condition

**Exclusions:** Inflammatory cardiomyopathy (BC42)  
Myocarditis (BC42)

**Coded Elsewhere:** Ischaemic cardiomyopathy (BA51)  
Pacing-induced cardiomyopathy (NE82.03)  
Cardiomyopathy in the puerperium (JB44.3)

**BC43.0 Dilated cardiomyopathy**

Dilated cardiomyopathy is a myocardial disorder in which there is systolic dysfunction and chamber dilation of one or both ventricles in the absence of a haemodynamic cause that can produce the existent dilation and dysfunction, including physiological (such as sepsis) or anatomic causes with either abnormal loading conditions (such as coarctation of the aorta) or ischaemia (such as coronary artery disease or anomalies).

Additional information: Physiological and anatomic conditions can affect the dilated cardiomyopathy morphofunctional phenotype. If this morphofunctional phenotype is retained after appropriate intervention, then a dilated cardiomyopathy is established.

**Inclusions:** Congestive cardiomyopathy

**BC43.00 Familial-genetic dilated cardiomyopathy**

Familial-genetic dilated cardiomyopathy is the presence of dilated cardiomyopathy that is present in multiple members of a pedigree, or in the presence of a genetic mutation known to be significantly associated with dilated cardiomyopathy.

Additional information: Candidate cytoskeletal and Z disk–encoding genes, most of whom are hypothesized to lead to abnormalities in force transmission, include  $\delta$ -sarcoglycan,  $\beta$ -sarcoglycan, desmin, lamin A/C, metavinculin, muscle LIM protein, titin,  $\alpha$ -actinin-2, nebulette, myopalladin, and ZASP (Z band alternatively spliced PDZ domain protein)

**Coded Elsewhere:** Dilated cardiomyopathy due to glycogen branching enzyme deficiency (5C51.3)

**BC43.01 Nonfamilial dilated cardiomyopathy**

Nonfamilial dilated cardiomyopathy is dilated cardiomyopathy secondary to an acquired systemic disorder that is known to be associated with dilated or inflammatory cardiomyopathy such as infectious myocarditis, exposure to toxins such as alcohol or anthracycline therapy, nutritional disorders, autoimmune disease, and many others.

**Exclusions:** Pacing-induced cardiomyopathy (NE82.03)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>BC43.3</b>       | <b>Endocardial fibroelastosis</b><br>Endocardial fibroelastosis is the formation of a marked fibro-elastic thickening of the subendocardium in one or both cardiac ventricles. A disorder of fetuses and infants, secondary causes include congenital left-sided obstructive cardiac lesions, metabolic disorders, autoimmune disease (anti-Ro/anti-La antibodies), and transplacental viral infection such as mumps. Primary endocardial fibroelastosis has been linked to recessive and x-linked inheritance, such as with Barth syndrome.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>BC43.4</b>       | <b>Cardiomyopathy due to drugs or other external agents</b><br>This is one type of cardiomyopathy due to drugs and other external agents. Causing agents are alcohol, cocaine chemotherapeutic agents, psychotherapeutic agents and chemical toxins.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>BC43.5</b>       | <b>Stress-induced cardiomyopathy</b><br>Stress-induced or Takotsubo cardiomyopathy is a disease of the myocardium characterised by episodes of acute onset, reversible left ventricular apical wall motion abnormalities mimicking acute myocardial infarction, but with non-specific electrocardiographic ST elevation and T wave changes, and minimal myocardial enzymatic release, in the absence of coronary stenosis.<br><br><b>Inclusions:</b> Takotsubo cardiomyopathy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>BC43.6</b>       | <b>Arrhythmogenic ventricular cardiomyopathy</b><br>Arrhythmogenic ventricular cardiomyopathy is a cardiomyopathy characterised by myocardial cell loss with partial or total replacement of right ventricular muscle by adipose and fibrous tissue, beginning subepicardially to become transmural in time, sparing the papillary muscles and trabeculae, and often associated with aneurysms particularly of the right ventricular outflow tract. There is progressive systolic impairment with ventricular dilation and marked propensity for ventricular arrhythmias of right, as well as left, ventricular origin. Classically a disease of the right ventricle, more recent evidence suggests left ventricular involvement to a varying extent in up to 75% of cases, as well as isolated left ventricular disease.                                                                                                                                                                                     |
| <b>BC43.7</b>       | <b>Diabetic cardiomyopathy</b><br>Diabetic cardiomyopathy is the presence of myocardial dysfunction in the absence of overt clinical coronary artery disease, valvar disease, and other conventional cardiovascular risk factors, such as hypertension and dyslipidemia. It is initially characterised by myocardial fibrosis, dysfunctional remodeling, and diastolic dysfunction, progressing to systolic dysfunction and heart failure.<br><br>Additional information. The development and progression of diabetic cardiomyopathy has been linked to impaired cardiac insulin metabolic signaling, increases in oxidative stress, reduced nitric oxide bioavailability, collagen-based cardiomyocyte and extracellular matrix stiffness, impaired mitochondrial and cardiomyocyte calcium handling, inflammation, renin–angiotensin–aldosterone system activation, cardiac autonomic neuropathy, endoplasmic reticulum stress, microvascular dysfunction, and a myriad of cardiac metabolic abnormalities. |
| <b>Coding Note:</b> | Always assign an additional code for diabetes mellitus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**BC43.Z      Cardiomyopathy, unspecified**

**Coding Note:** Code also the causing condition

**BC44      Noncompaction cardiomyopathy**

Noncompaction cardiomyopathy is a morphologic abnormality of the myocardium predominantly affecting the apex of the ventricle characterised by hypertrabeculation and deep inter-trabecular recesses, usually accompanied by an abnormally thin subepicardial layer of compacted myocardium, that is generally but not always associated with ventricular dysfunction.

Additional information. Noncompaction cardiomyopathy classically involves the left ventricle but can also involve only the right ventricle or both. It can occur as an isolated finding or in association with a dilated, hypertrophic, or mixed cardiomyopathic phenotype. It has been described in association with complex congenital heart disease, coronary artery anomalies and as an isolated finding, with and without musculoskeletal and other system abnormalities.

**BC45      Cardiomegaly**

**BC46      Intracardiac thrombosis**

#DRAFT# This is the intracardiac formation of a blood clot, not elsewhere classified.

**Exclusions:**      Acute myocardial infarction, without specification of ST elevation (BA41)

**BC4Y      Other specified diseases of the myocardium or cardiac chambers**

**BC4Z      Diseases of the myocardium or cardiac chambers, unspecified**

**Cardiac arrhythmia (BC60-BC9Z)**

This is any of a large and heterogeneous group of conditions in which there is abnormal electrical activity in the heart. The heartbeat may be too fast or too slow, and may be regular or irregular.

**Coded Elsewhere:** Cardiac arrest (MC82)

Cardiac arrhythmias in the neonate (KB41)

Dysfunction or complication of pacemaker, pacemaker lead or implantable cardioverter defibrillator, not elsewhere classified (NE82)

**BC60      Atrial premature depolarization**

Cardiac electrical depolarization arising from the atria, occurring earlier than the expected sinus beat

**BC61      Junctional premature depolarization**

Cardiac electrical depolarization arising from the compact atrioventricular node or His bundle occurring earlier than the expected sinus beat.

| <b>BC81.0</b>  | <b>Ectopic atrial tachycardia</b><br>Ectopic atrial tachycardia originates from a small area (focus) in the atrium and spreading centrifugally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>BC81.1</b>  | <b>Junctional ectopic tachycardia</b><br>Narrow or usual complex tachycardia originates from a focus at or near the atrioventricular junction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>BC81.2</b>  | <b>Macro reentrant atrial tachycardia</b><br>An atrial arrhythmia in which there is intra-atrial reentry or circus movement around a fixed or functional central obstacle. The central obstacle may consist of normal (e.g. valves) or abnormal (e.g. scar) structures.<br><br>This form of SVT originates in the atrium; conduction to the ventricles is not necessary for the tachycardia to continue. An organised atrial rhythm with a rate typically between 250 and 350 bpm, including tachycardias using a variety of reentry circuits that often occupy large areas of the atrium ("macro-reentrant"). Here the arrhythmia involves the cavotricuspid isthmus. |
| <b>BC81.20</b> | <b>Cavotricuspid isthmus dependent macroreentry tachycardia</b><br>A macro re-entrant atrial tachycardia that rotates around the tricuspid annulus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                |                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BC81.21</b> | <p>Non-scar, non-isthmus dependent macro reentrant atrial tachycardia</p> <p>A macro re-entrant atrial tachycardia coursing around a normal cardiac structure (except the cavotricuspid isthmus) such as the mitral valve annulus, or superior caval vein.</p>                                                                                                                             |
| <b>BC81.22</b> | <p>Scar mediated macro reentrant atrial tachycardia</p> <p>A macro re-entrant atrial tachycardia in which the central obstacle and/or the zone of slow conduction sustaining the tachycardia is due to scar. In this context scar generally refers to surgical or ischaemic heart disease mediated scarring rather than the fibrosis that can accompany other disease states or aging.</p> |
| <b>BC81.2Y</b> | Other specified macro reentrant atrial tachycardia                                                                                                                                                                                                                                                                                                                                         |

## Heart failure (BD10-BD1Z)

**Exclusions:** Heart failure following cardiac surgery or due to presence of cardiac prosthesis (BE11)  
complicating abortion or ectopic or molar pregnancy (JA05)  
complicating obstetric surgery and procedures (JB0D.3)

**Coded Elsewhere:** Neonatal cardiac failure (KB40)

### **BD10**

#### **Congestive heart failure**

A clinical syndrome characterised by abnormalities of ventricular function and neurohormonal regulation which are accompanied by effort intolerance and fluid retention.

**Coding Note:** Code also the causing condition

**Inclusions:** Congestive heart disease

### **BD11**

#### **Left ventricular failure**

A clinical syndrome characterised by abnormalities of left ventricular function resulting in pulmonary congestion and fluid retention.

**Coding Note:** Code also the causing condition

**Inclusions:** Left heart failure

#### **BD11.0**

##### **Left ventricular failure with preserved ejection fraction**

A syndrome of left ventricular dysfunction occurring with normal or relatively preserved ejection fraction

**Coding Note:** Code also the causing condition

#### **BD11.1**

##### **Left ventricular failure with mid range ejection fraction**

**Coding Note:** Code also the causing condition

#### **BD11.2**

##### **Left ventricular failure with reduced ejection fraction**

A syndrome of left ventricular dysfunction associated with reduced ejection fraction.

**Coding Note:** Code also the causing condition

#### **BD11.Z**

##### **Left ventricular failure, unspecified**

**Coding Note:** Code also the causing condition

### **BD12**

#### **High output syndromes**

Increased cardiac output above normal associated with anaemia, arteriovenous fistulas, thyrotoxicosis and other syndromes. May result in heart failure.

### **BD13**

#### **Right ventricular failure**

Heart failure associated with right ventricular dysfunction manifest by distention of the neck veins, enlargement of the liver, and dependent oedema.

**Coding Note:** Code also the causing condition

### **BD14**

#### **Biventricular failure**

**Coding Note:** Code also the causing condition

**BD1Y Other specified heart failure**

**Coding Note:** Code also the causing condition

**BD1Z Heart failure, unspecified**

**Coding Note:** Code also the causing condition

Diseases of arteries or arterioles (BD30-BD5Z)

**Exclusions:** Diseases of coronary artery (BA81-BA8Z)

**BD30 Acute arterial occlusion**

**Coding Note:** Code also the causing condition

**BD30.0 Acute upper limb arterial occlusion**

**BD30.00** Acute thromboembolic upper limb arterial occlusion

**BD30.01** Acute thrombotic upper limb arterial occlusion

**BD30.0Y** Other specified acute upper limb arterial occlusion

**BD30.0Z** Acute upper limb arterial occlusion, unspecified

**BD30.1 Acute aortoiliac occlusion**

**BD30.10** Acute thromboembolic aortoiliac occlusion

**BD30.11** Acute thrombotic aortoiliac occlusion

**BD30.1Y** Other specified acute aortoiliac occlusion

**BD30.1Z** Acute aortoiliac occlusion, unspecified

**BD30.2 Acute lower limb arterial occlusion**

**BD30.20** Acute thromboembolic lower limb arterial occlusion

**BD30.21** Acute thrombotic lower limb arterial occlusion

**BD30.2Y** Other specified acute lower limb arterial occlusion

**BD30.2Z** Acute lower limb arterial occlusion, unspecified

**BD30.Y Other specified acute arterial occlusion**

**Coding Note:** Code also the causing condition

**BD30.Z Acute arterial occlusion, unspecified**

**Coding Note:** Code also the causing condition

Chronic arterial occlusive disease (BD40-BD4Z)

**Coded Elsewhere:** Secondary peripheral angiopathy (BD53.Y)

**BD40 Atherosclerotic chronic arterial occlusive disease**

**Inclusions:** endarteritis deformans

senile arteritis

senile endarteritis

**Exclusions:** Chronic vascular disorders of intestine (DD31)

Cerebral ischaemic stroke due to intracranial large artery atherosclerosis (8B11.1)

Coronary atherosclerosis (BA52)

Chilblains (NF03.0)

Frostbite (NE40-NE4Z)

Cerebral ischaemic stroke due to extracranial large artery atherosclerosis (8B11.0)

Asymptomatic stenosis of intracranial or extracranial artery (BD55)

**Coded Elsewhere:** Atherosclerotic retinopathy (BD40.Y)

**BD40.0 Lower limb atherosclerosis**

This is a condition in which an artery wall thickens as a result of the accumulation of fatty materials such as cholesterol, of the lower limb.

**BD40.1 Atherosclerosis of aorta**

**BD40.2 Atherosclerosis of renal artery**

**Exclusions:** atherosclerosis of renal arterioles (BA02)

**BD40.3 Aortic bifurcation syndrome**

#DRAFT# This is the point at which the abdominal aorta bifurcates into the left and right common iliac arteries. The aortic bifurcation occurs at the level of the fourth lumbar vertebrae, just above the confluence of the left and right common iliac veins.

**BD40.Y Other specified atherosclerotic chronic arterial occlusive disease**

**BD40.Z Atherosclerotic chronic arterial occlusive disease, unspecified**

**BD41 Non-atherosclerotic chronic arterial occlusive disease**

A heterogeneous group of disorders which may present with symptoms suggestive of atherosclerotic peripheral arterial disease (e.g. intermittent claudication) but in which arterial or arteriolar occlusion is due to other causes such as fibromuscular dysplasia, thromboarteritis obliterans and calcific arteriopathy.

**Coded Elsewhere:** Thromboangiitis obliterans (4A44.8)

Calcific arteriopathy (EB90.42)

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>BD50</b>         | <b>Aortic aneurysm or dissection</b><br>Aortic aneurysm is a term for any swelling (dilation or aneurysm) of the aorta to greater than 1.5 times normal, usually representing an underlying weakness in the wall of the aorta at that location. Aortic dissection occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart.<br><br><b>Coded Elsewhere:</b> Postprocedural true or false aortic aneurysm (BE13)<br>Aortic aneurysm due to congenital heart disease (LA8Y)                    |
| <b>BD50.0</b>       | <b>Thoracic aortic dissection, ascending aorta dissection and propagation beyond arch</b><br>This occurs when a tear in the inner wall of the aorta causes blood to flow between the layers of the wall of the aorta, forcing the layers apart: ascending aorta dissection and propagation beyond arch.                                                                                                                                                                                                                                                                         |

| <b>BD53.3</b>       | <b>Popliteal entrapment syndrome</b><br>#DRAFT# This is a rather uncommon pathology, which results into claudication and chronic leg ischemia. The popliteal artery may be compressed behind the knee, due to congenital deformity of the muscles or tendon insertions of the popliteal space.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>BD53.4</b>       | <b>Cholesterol atheroembolism</b><br>Embolic occlusion of distal small arteries and arterioles by cholesterol crystals released from atherosclerotic plaque in larger more central arteries. The resultant microvascular ischaemia is accompanied by an inflammatory response to the presence of cholesterol crystals. This may occur spontaneously or as a complication of angiography or vascular surgery. Organs most commonly affected include the skin, kidneys, gastrointestinal tract, and brain. Cutaneous manifestations, present in the majority of cases, include livedo reticularis and focal ischaemic necrosis and ulceration; these are commonly associated with acute kidney injury. |
| <b>BD53.40</b>      | Cholesterol atheroembolism to kidneys<br>This occurs when cholesterol is released, usually from an atherosclerotic plaque, and travels along with the bloodstream (embolism) to other places in the kidneys, where it obstructs blood vessels.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>BD54</b>         | <b>Diabetic foot ulcer</b><br>Chronic foot ulcers occur in as many as 15–25% of diabetic patients. The underlying aetiology is a combination of disturbed sensation from diabetic neuropathy and impaired perfusion from diabetic vasculopathy. Poor foot care, abnormal foot structure, or poorly fitting shoes increase the risk of diabetic foot ulcers. The ulcers typically occur in areas of increased plantar pressure, especially beneath the metatarsal heads.<br><br><b>Coding Note:</b> Always assign an additional code for diabetes mellitus.                                                                                                                                           |

**BD56****Asymptomatic occlusion of intracranial or extracranial artery**

Occlusion of intracranial or extracranial artery that has not caused TIA or cerebral ischemic stroke.

**Exclusions:** Transient ischaemic attack (8B10)  
Cerebral ischaemic stroke (8B11)

**BD5Y****Other specified diseases of arteries or arterioles****BD5Z****Diseases of arteries or arterioles, unspecified**

## Diseases of veins (BD70-BD7Z)

**Coded Elsewhere:** Other venous complications following abortion, ectopic or molar pregnancy (JA05.7)

Venous complications in pregnancy (JA61)

**BD70****Superficial thrombophlebitis**

#DRAFT# This is a thrombosis and inflammation of superficial veins which presents as a painful induration with erythema, often in a linear or branching configuration forming cords.

**Coded Elsewhere:** Superficial thrombophlebitis in pregnancy (JA61.2)  
Superficial thrombophlebitis in the puerperium (JB41.0)

**BD70.0****Superficial thrombophlebitis of lower limbs**

Inflammation and thrombosis of the superficial veins of the lower limbs affecting particularly varicose superficial leg veins.

**BD70.1****Superficial thrombophlebitis of upper limbs****BD70.2****Thrombophlebitis migrans**

Thrombophlebitis migrans is characterised by the development of recurrent and migratory superficial thrombophlebitis. It is an acquired coagulopathy that is strongly associated with malignancy, especially solid tumours of the adenocarcinoma type.

**Coding Note:** Code also the causing condition

**BD70.3****Mondor disease**

A form of localised superficial venous thrombophlebitis typically affecting the chest wall and manifesting as a fibrous cord with surrounding skin retraction and an absence of overlying cutaneous inflammation. No cause is found in many cases but trauma and breast surgery are often implicated.

**Coded Elsewhere:** Mondor disease of the penis (GB06.3)

**BD70.Y****Other specified superficial thrombophlebitis****BD70.Z****Superficial thrombophlebitis, unspecified**

**BD93****Lymphoedema**

Swelling due to the excess accumulation of lymph in the tissues caused by inadequate lymph drainage. It typically affects the extremities but may involve any body site. It is disfiguring and increases susceptibility to recurrent infection and local malignancy.

**BD93.0****Primary lymphoedema**

Lymphoedema as a result of lymphatic vessel hypoplasia

**Coded Elsewhere:** Yellow nail syndrome (EE11.1)

Noonan syndrome (LD2F.15)

**BD93.1****Secondary lymphoedema**

Lymphoedema as a result of an identifiable cause that renders insufficient the function of existing lymphatic vessels.

**Coding Note:** Code also the causing condition

**BD93.10**

Lymphoedema due to venous insufficiency

Permanent lymphoedema, usually of the lower extremities, resulting from venous hypertension and chronic gravitational oedema.

**Coding Note:** Code also the causing condition

**BD93.11**

Lymphoedema due to dependency and immobility

Lymphoedema occurring in immobile individuals with reduced muscle pump activity as a result of paralysis or infirmity. It is particularly liable to develop in those who are unable to sleep recumbent.

**Coding Note:** Code also the causing condition

**BD93.12**

Lymphoedema due to obesity

Lymphoedema resulting from morbid obesity. Lymphoedema of the lower limbs and lymphoedema of the abdominal apron fold are common sequelae of chronic morbid obesity.

**Coding Note:** Code also the causing condition

**BD93.13**

Lymphoedema due to lymphatic filariasis

Lymphoedema resulting from infestation of lymphatics by nematode worms of the genera *Wuchereria* and *Brugia*. This is the commonest cause of lymphoedema worldwide. The lymphoedema may present years after initial infection and most commonly affects the legs and male genitalia.

**Coding Note:** Code also the causing condition

**BD93.14**

Lymphoedema due to podoconiosis

Lymphoedema of the lower limbs resulting from an inflammatory response within lymphatic vessels to mineral particles from soil in genetically susceptible individuals. It is a leading cause of lower limb lymphoedema in farmers in Africa, Central America and India.

**Coding Note:** Code also the causing condition

## Postprocedural disorders of circulatory system (BE10-BE1F.1)

This refers to postprocedural disorders of the organ system that passes nutrients (such as amino acids, electrolytes and lymph), gases, hormones, blood cells, etc. to and from cells in the body to help fight diseases, stabilize body temperature and pH, and to maintain homeostasis, not elsewhere classified.

**Coded Elsewhere:** Injury or harm arising from surgical or medical care, not elsewhere classified (NE80-NE8Z)

Prosthetic valve disease (BC01)

Coronary artery fistula, acquired (BA83)

Dysfunction or complication of pacemaker, pacemaker lead or implantable cardioverter defibrillator, not elsewhere classified (NE82)

Postprocedural complete atrioventricular block (BC63.21)

Postprocedural obstructed systemic venous pathway (BD73.2Y)

Postprocedural left pulmonary artery stenosis (BB02.3)

Postprocedural inferior caval vein complication (BD73.0)

Postprocedural superior caval vein complication (BD73.1)

Postoperative junctional ectopic tachycardia (BC81.1)

### **BE10**

#### **Postcardiotomy syndrome**

Postcardiotomy syndrome is a hypersensitivity reaction to antigen derived from injured myocardium 3 weeks to 2 months after myocardial infarction, cardiac surgery, or penetrating and non penetrating heart injury. The diagnosis is made by history of heart injury, and exclusion of other diseases such as congestive heart failure, recurrent myocardial infarction, endocarditis, myocarditis, and pericarditis.

### **BE11**

#### **Other functional disturbances following cardiac surgery**

### **BE12**

#### **Postprocedural valve disorders**

- BE12.0 Postprocedural mitral valve stenosis**  
 #DRAFT# This is a postprocedural valvular heart disease characterised by the narrowing of the orifice of the mitral valve of the heart.
- BE12.1 Postprocedural mitral valve insufficiency**  
 This is a postprocedural disorder of the heart in which the mitral valve does not close properly when the heart pumps out blood. It is the abnormal leaking of blood from the left ventricle, through the mitral valve, and into the left atrium, when the left ventricle contracts, i.e. there is regurgitation of blood back into the left atrium.
- BE12.2 Postprocedural aortic valve stenosis**  
**Coded Elsewhere:** Stenosis of the neo-aortic valve of pulmonary origin (BC02.30)
- BE12.3 Postprocedural aortic valve insufficiency**  
 This refers to postprocedural aortic valve of the heart that causes blood to flow in the reverse direction during ventricular diastole, from the aorta into the left ventricle.  
**Coded Elsewhere:** Insufficiency of the neo-aortic valve of pulmonary origin (BC02.31)
- BE12.4 Postprocedural tricuspid valve stenosis**  
 #DRAFT# This is a postprocedural valvular heart disease which results in the narrowing of the orifice of the tricuspid valve of the heart. It is a relatively rare condition that causes stenosis- increased resistance to blood flow through the valve.
- BE12.5 Postprocedural tricuspid valve insufficiency**  
 This refers to the postprocedural failure of the heart's tricuspid valve to close properly during systole. As a result, with each heart beat some blood passes from the right ventricle to the right atrium, the opposite of the normal direction.
- BE12.6 Postprocedural pulmonary valve stenosis**  
 #DRAFT# This is a postprocedural heart valve disorder in which outflow of blood from the right ventricle of the heart is obstructed at the level of the pulmonic valve.
- BE12.7 Postprocedural pulmonary valve insufficiency**  
 #DRAFT# This is a postprocedural condition where the pulmonary valve is not strong enough to prevent backflow to the right ventricle.
- BE13 Postprocedural true or false aortic aneurysm**  
 This refers to postprocedural true and false swelling (dilation or aneurysm) of the aorta to greater than 1.5 times normal, usually representing an underlying weakness in the wall of the aorta at that location.
- BE14 Postprocedural disorder of circulatory system following repair of congenital heart or great vessel anomaly**
- BE14.4 Acquired abnormality of the neopulmonary valve**  
 A postnatal pathological change in form or function of the neopulmonary valve, that is, the native aortic valve that has become the functional neopulmonary valve after the arterial switch operation.
