| <b>Exclusions:</b>      | <p>when the reason for maternal care is that the condition is known or suspected to have affected the fetus (JA85)</p> <p>infectious and parasitic diseases (JB63)</p> <p>Injury, poisoning or certain other consequences of external causes (Chapter 22)</p>                    |
| <b>Coded Elsewhere:</b> | <p>Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)</p> <p>Injury complicating pregnancy (ND56.9)</p>                                                                                                                         |
| <b>JB64.0</b>           | <p><b>Anaemia complicating pregnancy, childbirth or the puerperium</b></p> <p>A condition of the circulatory system affecting pregnant females, characterised by a haemoglobin level below 11 grams per decilitre that complicates pregnancy, childbirth, or the puerperium.</p> |
| <b>Coding Note:</b>     | This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.                                                                                  |

- JB64.1 Other diseases of the blood or blood-forming organs or certain disorders involving the immune mechanism complicating pregnancy, childbirth or the puerperium**  
Any disease affecting pregnant females, characterised by pathological changes to the blood and blood-forming organs and pathological changes involving the immune mechanism that complicate pregnancy, childbirth, or the puerperium not classified elsewhere.
- Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.
- Exclusions:** Antepartum haemorrhage with coagulation defect (JA41.0)  
Intrapartum haemorrhage with coagulation defect (JA42.0)
- JB64.2 Endocrine, nutritional or metabolic diseases complicating pregnancy, childbirth or the puerperium**  
Any disease affecting pregnant females, characterised by endocrine, nutrition, or metabolic manifestations that complicate pregnancy, childbirth, or the puerperium.
- Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.
- Exclusions:** Malnutrition in pregnancy (JA64)  
Diabetes mellitus in pregnancy (JA63)  
Postpartum thyroiditis (JB44.5)
- JB64.3 Diseases of the nervous system complicating pregnancy, childbirth or the puerperium**  
Any disorder or disease of the nervous system affecting pregnant females leading to complications during pregnancy, childbirth, or puerperium.
- Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.
- Exclusions:** Mental or behavioural disorders associated with pregnancy, childbirth or the puerperium (6E20-6E2Z)
- JB64.4 Diseases of the circulatory system complicating pregnancy, childbirth or the puerperium**
- Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.
- Exclusions:** Obstetric embolism (JB42)  
venous complications and cerebrovenous sinus thrombosis in pregnancy (JA61)  
Venous complications in the puerperium (JB41)  
Oedema, proteinuria, or hypertensive disorders in pregnancy, childbirth, or the puerperium (JA20-JA2Z)  
Cardiomyopathy in the puerperium (JB44.3)  
Other venous complications following abortion, ectopic or molar pregnancy (JA05.7)

**JB64.5 Diseases of the respiratory system complicating pregnancy, childbirth or the puerperium**

**Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.

**JB64.6 Diseases of the digestive system complicating pregnancy, childbirth or the puerperium**

**Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.

**Exclusions:** Liver disorders in pregnancy, childbirth or the puerperium (JA65.0)

**JB64.7 Diseases of the skin complicating pregnancy, childbirth or the puerperium**

Diseases of the skin or subcutaneous tissue not specifically related to pregnancy but which contribute to increased morbidity during pregnancy, childbirth or the puerperium, for example genetic blistering disorders or lichen sclerosus.

**Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.

**Exclusions:** Herpes gestationis (JA65.10)  
Gestational pemphigoid (JA65.10)  
Polymorphic eruption of pregnancy (JA65.12)  
Pregnancy dermatoses (JA65.1)  
Pruritus of pregnancy (JA65.11)

**JB64.8 Congenital anomaly complicating pregnancy**

**JB64.Y Other specified maternal diseases classifiable elsewhere but complicating pregnancy, childbirth or the puerperium**

**Coding Note:** This category includes conditions which complicate the pregnant state, are aggravated by the pregnancy or are a main reason for obstetric care but no specific category exists in this chapter.

**JB65 Sequelae of complication of pregnancy, childbirth or the puerperium**

A secondary condition that develops during the period of time from conception to delivery (pregnancy), during labour and delivery (childbirth) or during the six weeks following delivery (puerperium).

**Exclusions:** Death from any obstetric cause occurring more than 42 days but less than one year after delivery (JB61)  
Death from sequelae of obstetric causes (JB62)

**JB6Y Other specified obstetric conditions, not elsewhere classified**

**JB6Z Unspecified obstetric condition**

## CHAPTER 19

---

### Certain conditions originating in the perinatal period

This chapter has 151 four-character categories.

Code range starts with KA00

This chapter includes conditions that have their origin in the perinatal period even though death or morbidity occurs later.

**Coding Note:** Conditions arising in the perinatal period, even though death or morbidity occurs later, should, as far as possible, be coded to chapter 19, which takes precedence over chapters containing codes for diseases by their anatomical site.

For children less than 28 days old, assume that a reported condition developed in the perinatal period, unless the duration is stated and the onset was after the first completed week of life.

**Exclusions:**

- Endocrine, nutritional or metabolic diseases (Chapter 05)
- Congenital malformations, deformations and chromosomal abnormalities (Chapter 20)
- Neoplasms (Chapter 02)
- Injury, poisoning or certain other consequences of external causes (Chapter 22)
- Congenital gonococcal infection (1A70-1A7Z)
- Certain infectious or parasitic diseases - acquired after birth (Chapter 01)
- Gastroenteritis or colitis of infectious origin (1A00-1A40.Z)
- Hereditary haemolytic anaemia (3A10)
- Transient hypogammaglobulinaemia of infancy (4A01.03)
- Certain congenital diseases of the nervous system (Chapter 08)
- congenital cardiomyopathy (BC43)
- Paralytic ileus (DA93.0)
- Pemphigus neonatorum (EA50)
- Cradle cap (EH40.00)

This chapter contains the following top level blocks:

- Fetus or newborn affected by maternal factors or by complications of pregnancy, labour or delivery
- Disorders of newborn related to length of gestation or fetal growth
- Birth injury
- Infections of the fetus or newborn
- Haemorrhagic or haematological disorders of fetus or newborn

- Neurological disorders specific to the perinatal or neonatal period
- Respiratory disorders specific to the perinatal or neonatal period
- Cardiovascular disorders present in the perinatal or neonatal period
- Transitory endocrine or metabolic disorders specific to fetus or newborn
- Digestive system disorders of fetus or newborn
- Genitourinary system disorders specific to the perinatal or neonatal period
- Disorders involving the integument of fetus or newborn
- Disturbances of temperature regulation of newborn
- Certain disorders originating in the perinatal period

## Fetus or newborn affected by maternal factors or by complications of pregnancy, labour or delivery (KA00-KA0Z)

A group of conditions characterised by findings in the fetus or newborn due to conditions associated with the mother or by an adverse evolution (complication) which may arise associated with the time period from conception through childbirth.

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

### KA00

#### **Fetus or newborn affected by maternal conditions that may be unrelated to present pregnancy**

A group of conditions characterised by findings in the fetus or newborn due to conditions associated with the mother which are unrelated to the present pregnancy.

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

**Exclusions:** Fetus or newborn affected by maternal complications of pregnancy (KA01)

fetus and newborn affected by maternal endocrine and metabolic disorders (KB60-KB6Z)

Fetus or newborn affected by noxious influences transmitted via placenta or breast milk (KA06)

#### **KA00.0 Fetus or newborn affected by maternal hypertensive disorders**

Maternal hypertensive disorders - chronic hypertension, preeclampsia-eclampsia, preeclampsia superimposed on chronic hypertension, and gestational hypertension.

#### **KA00.1 Fetus or newborn affected by gestational oedema or proteinuria without hypertension**

#### **KA00.2 Fetus or newborn affected by maternal renal or urinary tract diseases**

A group of conditions characterised by findings in the fetus or newborn due to conditions in the mother associated with the kidneys and urinary tract.

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA00.3</b>       | <b>Fetus or newborn affected by maternal infectious diseases</b><br>A condition affecting fetuses or newborns, that is (or suspected to be) caused by a maternal infection with a bacterial, viral, fungal, or parasitic source.<br><i><b>Exclusions:</b></i> Infections of the genital tract in pregnancy (JA62.4)                                                                                                                                                                                                                    |
| <b>KA00.4</b>       | <b>Fetus or newborn affected by periodontal disease in mother</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>KA00.5</b>       | <b>Fetus or newborn affected by maternal respiratory diseases</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>KA00.6</b>       | <b>Fetus or newborn affected by maternal nutritional disorders</b><br>A group of conditions characterised by findings in the fetus or newborn due to conditions in the mother that are directly or indirectly associated with a lack of essential nutrients in the diet.                                                                                                                                                                                                                                                               |
| <b>KA00.60</b>      | Fetus or newborn affected by maternal malnutrition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>KA00.61</b>      | Fetus or newborn affected by maternal overweight or obesity                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>KA00.Y</b>       | <b>Fetus or newborn affected by other specified maternal condition that may be unrelated to present pregnancy</b>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Coding Note:</b> | These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.                                                                                                                                                                                                                      |

**KA00.Z Fetus or newborn affected by unspecified maternal condition that may be unrelated to present pregnancy**

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

**KA01 Fetus or newborn affected by maternal complications of pregnancy**

Any other condition characterised by findings in the fetus or newborn due to any condition of the mother due to an adverse evolution (complication) which may arise associated with the time period from conception through childbirth.

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

**KA01.0 Fetus or newborn affected by incompetence of cervix uteri**

Cervical incompetence refers to a weakness of the cervix and lower uterine segment, which can lead to recurrent second-trimester or early third-trimester loss of pregnancy due to an inability of the uterine cervix to retain a pregnancy until term. It is associated with a premature shortening of the cervix, dilatation, and opening of the cervical os during pregnancy. Ultrasound changes that suggest cervical incompetence include a cervical length < 1.5 cm, cervical width > 3 cm, and an expanded cervical canal > 8 mm.

**KA01.1 Fetus or newborn affected by premature rupture of membranes**

Preterm premature rupture of membranes (PPROM) refers to a patient who is at less than 37 weeks' gestation and has presented with a rupture of membranes prior to the onset of labour. Complications include pre-term delivery, ascending infection, umbilical cord prolapse, oligohydramnios, placental abruption, retained placenta, postpartum haemorrhage, or rupture of the vasa praevia.

**KA01.2 Fetus or newborn affected by oligohydramnios**

Oligohydramnios is defined as a decrease in the volume of amniotic fluid. It is diagnosed if the diameter of the largest amniotic fluid depot is < 2 cm, or if the amniotic fluid index (AFI) is < 5 cm.

**Exclusions:** Fetus or newborn affected by premature rupture of membranes (KA01.1)

**KA01.3 Fetus or newborn affected by polyhydramnios**

Polyhydramnios is defined as an abnormally large volume of amniotic fluid within the uterus. An amount of 2 L at term, any single pool >8cm or an amniotic fluid index (AFI) > 24 cm is considered to be polyhydramnios.

**Inclusions:** fetus or newborn affected by hydramnios

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>KA01.4</b> | <p><b>Fetus or newborn affected by ectopic pregnancy</b></p> <p>An ectopic pregnancy occurs when a pregnancy begins outside of the uterus. The most common site is within one of the fallopian tubes, although in rare cases, ectopic pregnancies can occur in the stomach region, cervix, or ovary. It is often caused by a condition that slows or blocks the movement of a fertilised egg through the fallopian tube to the uterus. Ectopic pregnancies cannot continue to term and the developing cells must be removed to prevent rupture of the ectopic area, which can lead to shock and danger the life of the mother.</p> <p><b>Inclusions:</b> Abdominal pregnancy affecting fetus or newborn</p> |
| <b>KA01.5</b> | <p><b>Fetus or newborn affected by multiple pregnancy</b></p> <p>A condition characterised by findings in the fetus or newborn due to any condition associated with the presence of a multiple pregnancy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>KA01.6</b> | <p><b>Fetus or newborn affected by maternal death</b></p> <p>A condition characterised by findings in the fetus or newborn due to death of the mother.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>KA01.7</b> | <p><b>Fetus or newborn affected by malpresentation before labour</b></p> <p>Malpresentations are all presentations of the fetus other than the vertex, and includes breech, transverse, shoulder, compound, face, and brow presentations. They may pose risks to the fetus and mother and may necessitate operative vaginal or caesarean delivery, or other interventions to accomplish delivery. Breech presentation, the most common malpresentation, results when the fetal buttocks, legs, feet, or a combination of these presents first into the maternal pelvis.</p>                                                                                                                                 |
| <b>KA01.8</b> | <p><b>Fetus or newborn affected by maternal blood loss</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>KA02.0</b>       | <p><b>Fetus or newborn affected by placenta praevia</b></p> <p>Placenta praevia exists when the placenta lies wholly or in part in the lower segment of the uterus. Diagnosis has evolved from the clinical I-IV grading system, and is determined by ultrasonic imaging techniques relating the leading edge of the placenta to the cervical os. Grade I is a low lying placenta, Grade II is a placenta that meets the edge of the cervical os, Grade III is a placenta that partially covers the os, and Grade IV is a placenta that completely covers the os.</p>                                                                                                                                                                                                                                                                                                       |
| <b>KA02.1</b>       | <p><b>Fetus or newborn affected by placental oedema or large placenta</b></p> <p>A large placenta, also known as placentomegaly, is one that weighs &gt; 750 g. Placentomegaly can be seen in the following conditions: fetal hydrops, maternal diabetes mellitus, Rh incompatibility, chronic infections (e.g. syphilis, cytomegalovirus), maternal anaemia, or acute placental oedema with acute chorioamnionitis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>KA02.2</b>       | <p><b>Fetus or newborn affected by placental infarction</b></p> <p>Placental infarction is the formation of localised areas of ischemic villous necrosis, usually due to vasospasm of the maternal circulation. The affected regions of the placenta are incompetent, and lead to placental insufficiency if the infarcts are severe.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>KA02.3</b>       | <p><b>Fetus or newborn affected by placental insufficiency or small placenta</b></p> <p>Placental insufficiency is defined as the inability of the placenta to deliver a sufficient supply of oxygen and nutrients to the fetus, and therefore, is unable to sustain the growth of the developing baby until term. Placental insufficiency can result in intrauterine growth restriction (IUGR), pre-eclampsia, abruption, or preterm labour and delivery. A small placenta is defined as a placenta that weighs less than the lower limit of normal for the gestational period. A low placental weight can be the result of a maternal or fetal conditions. Among maternal conditions belong those causing underperfusion of the placenta, such as pre-eclampsia or maternal hypertension. Among fetal conditions belong fetal malformations or chromosomal anomalies.</p> |
| <b>KA02.4</b>       | <p><b>Fetus or newborn affected by placental transfusion syndromes</b></p> <p>Twin-to-twin transfusion syndrome (TTTS) occurs in monozygotic twins while they are in the uterus. It occurs when blood travels from one twin to the other, and the twin that loses blood is the donor twin, while the twin that receives blood is the recipient twin. Depending on the severity of the transfusion, both infants may experience problems, such as anaemia, paleness, and dehydration in the donor twin, and redness and an increased blood pressure in the recipient twin.</p> <p><b>Inclusions:</b> Placental and cord abnormalities resulting in twin-to-twin or other transplacental transfusion</p>                                                                                                                                                                      |
| <b>KA02.Y</b>       | <p><b>Fetus or newborn affected by other specified complication of placenta</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>KA04.Y</b> | <b>Fetus or newborn affected by other specified abnormality of membranes</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>KA04.Z</b> | <b>Fetus or newborn affected by unspecified abnormality of membranes</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>KA05</b>   | <b>Fetus or newborn affected by certain complications of labour or delivery</b><br>A group of conditions characterised by findings in the fetus or newborn due to any other adverse evolution (complication) during labour and delivery.<br><br><b>Coding Note:</b> These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn. |
| <b>KA05.0</b> | <b>Fetus or newborn affected by breech delivery or extraction</b><br>Breech presentation refers to a fetus that is lying with its bottom downwards. There are three different types of breech presentation: breech with extended legs (frank), fully flexed legs (complete), or footling (incomplete) with one or both thighs extended. Breech presentation is associated with an increased risk of intrapartum trauma or asphyxia, and caesarean section is a common mode of delivery to reduce birth-related complications.                                                         |
| <b>KA05.1</b> | <b>Fetus or newborn affected by other malpresentation, malposition or disproportion during labour or delivery</b><br>A condition characterised by findings in the fetus or newborn due to abnormal positions of the vertex of the fetal head (malposition) or any presentation position of the fetus other than vertex of the fetal head, first (malpresentation) during labour and delivery.                                                                                                                                                                                         |
| <b>KA05.2</b> | <b>Fetus or newborn affected by forceps delivery</b><br>A condition characterised by findings in the fetus or newborn due to assisted birth in which intervention assistance is provided with smooth metal instruments curved to fit around the head (forceps).                                                                                                                                                                                                                                                                                                                       |
| <b>KA05.3</b> | <b>Fetus or newborn affected by delivery by vacuum extractor</b><br>A condition characterised by findings in the fetus or newborn due to assisted birth in which intervention assistance is provided with a soft or hard plastic or metal cup attached by a tube to a suction device that fits firmly onto the head and attaches with suction (vacuum extractor, ventouse).<br><br><b>Inclusions:</b> Fetus and newborn affected by delivery by ventouse                                                                                                                              |

| <b>KA05.4</b>       | <b>Fetus or newborn affected by caesarean delivery</b><br>A condition characterised by findings in the fetus or newborn due to delivery via a surgical procedure in which one or more incisions are made through a mother's abdomen (laparotomy) and uterus (hysterotomy) to deliver one or more babies (Caesarean delivery).                                                                                                                                                              |
| <b>KA05.5</b>       | <b>Fetus or newborn affected by precipitate delivery</b><br>A precipitate delivery is one that is < 3 hours and where contractions are unusually severe. It commonly occurs in multiparous women or when labour has been induced. Due to the force and speed of delivery, trauma may occur to the mother and newborn. The mother may suffer from haemorrhage, perineal laceration, infection, or uterine rupture, and the newborn may suffer from subdural hematoma, anoxia, or fractures. |
| <b>KA05.6</b>       | <b>Fetus or newborn affected by abnormal uterine contractions</b><br>Abnormal uterine contractions can either be hypertonic or hypotonic. Hypertonic contractions are ones that occur more frequently and are marked by an increase in resting tone to more than 15 mm Hg. Hypotonic contractions are ones where the number of contractions is unusually low, the resting tone of the uterus is less than 10 mm Hg, and the strength of contractions is consistently < 26 mm Hg.           |
| <b>KA05.7</b>       | <b>Fetus or newborn affected by abnormality in fetal intrauterine heart rate or rhythm</b>                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>KA05.70</b>      | Fetus and newborn affected by abnormality in fetal intrauterine heart rate or rhythm before onset of labour                                                                                                                                                                                                                                                                                                                                                                                |
| <b>KA05.71</b>      | Fetus and newborn affected by abnormality in fetal intrauterine heart rate or rhythm during labour                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>KA05.7Z</b>      | Fetus or newborn affected by abnormality in fetal intrauterine heart rate or rhythm, unspecified                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>KA05.8</b>       | <b>Meconium passage during delivery</b><br>Meconium passage by the fetus during labour and/or delivery process.<br><b>Exclusions:</b> Neonatal aspiration of meconium (KB26.0)<br>Meconium staining (KD38)                                                                                                                                                                                                                                                                                 |
| <b>KA05.Y</b>       | <b>Fetus or newborn affected or suspected to be affected by other specified complications of labour or delivery</b>                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Coding Note:</b> | These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.                                                                                                                                                                          |
| <b>KA05.Z</b>       | <b>Fetus or newborn affected or suspected to be affected by unspecified complications of labour or delivery</b>                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Coding Note:</b> | These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.                                                                                                                                                                          |

**KA06****Fetus or newborn affected by noxious influences transmitted via placenta or breast milk**

A group of conditions characterised by findings in the fetus or newborn due to the transmission of any harmful or poisonous substance to the fetus or newborn via the placenta or in breast milk.

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

**Inclusions:** nonteratogenic effects of substances transmitted via placenta

**Exclusions:** congenital malformations (Chapter 20)

Neonatal hyperbilirubinaemia due to drugs or toxins  
transmitted from mother (KA87.4)

**KA06.0****Fetus or newborn affected by maternal anaesthesia or analgesia in pregnancy, labour or delivery**

A condition characterised by findings in the fetus or newborn due to the transmission of anaesthesia or analgesia provided to the mother during the period of time between conception and childbirth.

**Inclusions:** Reactions and intoxications from maternal opiates and  
tranquillizers administered during labour and delivery

**KA06.1****Fetus or newborn affected by maternal use of tobacco**

A condition characterised by findings in the fetus or newborn due to the transmission of any substances derived from tobacco use by the mother to the fetus or newborn.

**Exclusions:** Exposure to tobacco smoke in the perinatal period (KD37)

**KA06.2****Fetus or newborn affected by maternal use of alcohol**

A condition characterised by findings in the fetus or newborn due to the transmission of any substances derived from alcohol use by the mother to the fetus or newborn.

**Exclusions:** Fetal alcohol syndrome (LD2F.00)

**KA06.3****Fetus or newborn affected by maternal use of drugs of addiction**

A condition characterised by findings in the fetus or newborn due to the transmission of any substances derived from other drug use by the mother to the fetus or newborn.

**Exclusions:** Fetus or newborn affected by maternal anaesthesia or  
analgesia in pregnancy, labour or delivery (KA06.0)  
withdrawal symptoms from maternal use of drugs of addiction  
(KD35)

**KA06.4****Fetus or newborn affected by maternal use of nutritional chemical substances**

A condition characterised by findings in the fetus or newborn due to the transmission of any substances derived from nutritional chemical use by the mother to the fetus or newborn.

**KA06.5 Fetus or newborn affected by maternal exposure to environmental chemical substances**

A condition characterised by findings in the fetus or newborn due to the transmission of any substances derived from exposure of the mother to environmental chemicals.

**KA06.Y Fetus or newborn affected by other specified noxious influence transmitted via placenta or breast milk**

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

**KA06.Z Fetus or newborn affected by unspecified noxious influence transmitted via placenta or breast milk**

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

**KA07 Neonatal dermatoses due to maternal antibodies**

A range of antibody-mediated neonatal skin disorders due to transplacental transfer of maternal antibodies to the fetus. The relevant autoimmune disorder may or may not be apparent in the mother.

**KA07.0 Neonatal lupus erythematosus**

Neonatal lupus erythematosus results from trans-placental transfer of maternal antibodies, in particular anti-Ro/SSA and anti La/SSB. It manifests with an erythematous rash which may be obviously photosensitive and is closely associated with congenital heart block. The mother may have known lupus, especially subacute cutaneous lupus erythematosus, but she may be asymptomatic. The rash normally subsides within the first few months of life.

**KA07.1 Neonatal pemphigus**

Neonatal pemphigus vulgaris is a short lived autoimmune skin disease arising as a result of transplacental transmission to the neonate of maternal antibodies. Neonatal pemphigus is characterised by blister formation on the skin and the mucous membranes mediated by auto-antibodies to the desmosome component desmoglein 3.

**KA07.Y Other specified neonatal dermatoses due to maternal antibodies**

**KA0Z Fetus or newborn affected by unspecified maternal factors or by complications of pregnancy, labour or delivery**

**Coding Note:** These codes are for use when the listed maternal conditions are specified as the cause of confirmed morbidity or potential morbidity which have their origin in the perinatal period (before birth through the first 28 days after birth). Use additional code to identify the condition in the fetus or newborn.

## Disorders of newborn related to length of gestation or fetal growth (KA20-KA2Z)

A group of conditions related to the length of time that the fetus is carried inside the uterus and develops.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

### **KA20**

#### **Disorders of newborn related to slow fetal growth or fetal malnutrition**

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

#### **KA20.0 Small for gestational age**

Birth weight below – 2 standard deviations of the mean or below the 10th percentile according to local intrauterine growth charts

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**Inclusions:** Small-for-dates

#### **KA20.00 Small for gestational age, symmetrical**

Growth of the fetus is affected in early pregnancy and growth is slow throughout the duration of the pregnancy. The head circumference is proportional to the rest of the body. Birth weight is 2 standard deviations below the mean, or below the 10th percentile.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

#### **KA20.01 Small for gestational age, asymmetrical**

This growth restriction leads to a disparity in length and head circumference when compared to birth weight. This condition typically occurs in the third trimester.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

#### **KA20.0Z Small for gestational age, unspecified**

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

#### **KA20.1 Intrauterine growth restriction**

The fetus does not achieve its predicted genetic potential and infant, not light or small for gestational age, showing signs of fetal malnutrition.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

#### **KA20.10 Asymmetrical intrauterine growth restriction**

There is restriction of body weight followed by length with general head sparing. This condition occurs late in pregnancy and is caused by extrinsic factors. Fetal malnutrition leading to low ponderal index less than 2 (weight to length ratio) but weight not severe enough to qualify as small for gestational age.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

|                     |                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA20.11</b>      | <p>Symmetrical intrauterine growth restriction</p> <p>This condition begins earlier in pregnancy and there is a higher incidence of permanent neurologic sequela. It is often associated with either genetic abnormalities or fetal infection, especially 1st trimester viral infections.</p> |
| <b>Coding Note:</b> | When both birth weight and gestational age are available, priority of assignment should be given to birth weight.                                                                                                                                                                             |
| <b>KA20.12</b>      | <p>Intrauterine growth restriction associated with small for gestational age</p> <p>These infants are classified as small for gestational age but have also been subject to intrauterine growth restriction.</p>                                                                              |
| <b>Coding Note:</b> | When both birth weight and gestational age are available, priority of assignment should be given to birth weight.                                                                                                                                                                             |
| <b>KA20.1Y</b>      | Other specified intrauterine growth restriction                                                                                                                                                                                                                                               |
| <b>Coding Note:</b> | When both birth weight and gestational age are available, priority of assignment should be given to birth weight.                                                                                                                                                                             |
| <b>KA20.1Z</b>      | Intrauterine growth restriction, unspecified                                                                                                                                                                                                                                                  |

| <b>Coding Note:</b> | When both birth weight and gestational age are available, priority of assignment should be given to birth weight.                                                                                                                                                                             |

**KA21****Disorders of newborn related to short gestation or low birth weight, not elsewhere classified**

Infants whose weight is appropriate for their gestational ages are termed appropriate for gestational age (AGA). Infants that are heavier than expected are large for gestational age (LGA). Conversely, those smaller than expected are considered small for gestational age (SGA).

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**Exclusions:** Disorders of newborn related to slow fetal growth or fetal malnutrition (KA20)

**KA21.0 Extremely low birth weight of newborn**

Newborn birth weight 999 g or less. Infants have increased morbidity including neurosensory disability, cerebral palsy, retinopathy of prematurity, deafness, pulmonary immaturity, chronic lung disease and subnormal cognitive function.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.00 Extremely low birth weight of newborn, 499g or less**

A paediatric condition in which the infant is born weighing 499 g or less.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.01 Extremely low birth weight of newborn, 500-749g**

A paediatric condition in which the infant is born weighing between 500 and 749 g.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.02 Extremely low birth weight of newborn, 750-999g**

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.0Z Extremely low birth weight of newborn, unspecified**

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.1 Very low birth weight of newborn**

A paediatric condition in which the infant is born weighing between 1000 and 1499 g.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.10 Very low birth weight of newborn, 1000-1249g**

A paediatric condition in which the infant is born weighing between 1000 and 1249 g.

**KA21.11 Very low birth weight of newborn, 1250-1499g**

A paediatric condition in which the infant is born weighing between 1250 and 1499 g.

**KA21.44** Preterm newborn, gestational age 32 completed weeks  
Preterm newborn, gestational age 32 weeks, 0 days through 32 weeks, 6 days

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.45** Preterm newborn, gestational age 33 completed weeks  
Preterm newborn, gestational age 33 weeks, 0 days through 33 weeks, 6 days

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.46** Preterm newborn, gestational age 34 completed weeks  
Preterm newborn, gestational age 34 weeks, 0 days through 34 weeks, 6 days

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.47** Preterm newborn, gestational age 35 completed weeks  
Preterm newborn, gestational age 35 weeks, 0 days through 35 weeks, 6 days

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.48** Preterm newborn, gestational age 36 completed weeks  
Preterm newborn, gestational age 36 weeks, 0 days through 36 weeks, 6 days

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA21.4Z** Preterm newborn, unspecified

**Coding Note:** When both birth weight and gestational age are available, priority of assignment must be given to gestational age.

**KA22** **Disorders of newborn related to long gestation or high birth weight**  
Usually implies gestation > 290 or 294 days (42 weeks); high birthweight = >4000g.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**KA22.0** **Exceptionally large newborn**  
An exceptionally large baby is defined as having a weight at birth of > 4500 g, regardless of gestational age at birth.

**Coding Note:** When both birth weight and gestational age are available, priority of assignment should be given to birth weight.

**Exclusions:** Syndrome of infant of mother with gestational diabetes (KB60.0)  
Syndrome of infant of a diabetic mother, type 1 or 2, nongestational, insulin dependent (KB60.1)

## Birth injury (KA40-KA4Z)

A group of conditions characterised by the presence of damage of the tissues and organs of a newly delivered child due to physical pressure or injury during delivery.

|             |                                                                                                                                                                                                   |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA40.0</b>  | <b>Intracranial laceration or haemorrhage due to birth injury</b><br>A group of conditions characterised as a traumatic brain injury occurring when the tissue of the brain is mechanically cut or torn and bleeds in a newly delivered child due to physical pressure or injury during delivery.<br><b>Exclusions:</b> intracranial haemorrhage of fetus or newborn: due to anoxia, hypoxia, or ischaemia (KA82)<br><br>Intracranial nontraumatic haemorrhage of fetus or newborn (KA82) |
| <b>KA40.00</b> | <b>Subdural haemorrhage due to birth injury</b><br>Haemorrhage into the subdural space (between the dura and the arachnoid) resulting from traumatic tearing of the bridging veins and venous sinuses due to rotational movement of the brain secondary to a traumatic delivery.<br><b>Exclusions:</b> subdural haemorrhage accompanying tentorial tear (KA40.05)                                                                                                                         |
| <b>KA40.01</b> | <b>Cerebral haemorrhage due to birth injury</b><br>Cerebral haemorrhage due to birth injury refers to haemorrhage occurring into the cerebral parenchyma as a result of birth trauma, and is commonly accompanied by extracerebral contusion and/or bleeding haemorrhage in the scalp. May have associated skull fracture(s).                                                                                                                                                             |
| <b>KA40.02</b> | <b>Cerebellar haemorrhage due to birth injury</b><br>Haemorrhage into the cerebellum, hemispheres or vermis, due to trauma. Occipitaloseodiastasis with breech delivery is the most common cause of this injury.                                                                                                                                                                                                                                                                          |
| <b>KA40.03</b> | <b>Intraventricular haemorrhage due to birth injury</b><br>Traumatic haemorrhage into the intraventricular space as the dominant lesion, usually in a term infant, a result of birth trauma. Usually seen in conjunction with other intracranial bleeding (parenchymal, subdural, subarachnoid) and can be seen in the term or preterm infant.                                                                                                                                            |
| <b>KA40.04</b> | <b>Subarachnoid haemorrhage due to birth injury</b><br>Haemorrhage within the subarachnoid space (the area between the arachnoid membrane and the pia matter) due to either leakage from the leptomeningeal plexus or rupture of bridging veins within the subarachnoid space.                                                                                                                                                                                                            |
| <b>KA40.05</b> | <b>Tentorial tear due to birth injury</b><br>Lacerations of tentorium cerebelli due to birth trauma, usually resulting in infratentorial haemorrhages; lesser degrees of tentorial injury most commonly associated with subdural bleeds.                                                                                                                                                                                                                                                  |
| <b>KA40.06</b> | <b>Cerebellar contusion due to birth injury</b><br>A bruise of the brain tissue. There is a punctuate haemorrhage which occurs in the long gyri.                                                                                                                                                                                                                                                                                                                                          |
| <b>KA40.07</b> | <b>Cerebral contusion due to birth injury</b><br>A bruise of the brain tissue. Focal region of necrosis and haemorrhage, usually involving the cerebral cortex and subcortical white matter                                                                                                                                                                                                                                                                                               |

|                |                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA40.08</b> | Extradural or epidural haemorrhage due to birth injury<br>Haemorrhage in the plane between the skull bone and the periosteum on the inner surface of the skull from injury to the middle meningeal artery from birth trauma                                                                                                                |
| <b>KA40.0Y</b> | Other specified intracranial laceration or haemorrhage due to birth injury                                                                                                                                                                                                                                                                 |
| <b>KA40.0Z</b> | Intracranial laceration or haemorrhage due to birth injury, unspecified                                                                                                                                                                                                                                                                    |
| <b>KA40.1</b>  | <b>Cerebral oedema due to birth injury</b><br>Cerebral oedema is an excessive accumulation of water in the intracellular or extracellular spaces of the brain. There is a breakdown of the tight endothelial junctions which make up the blood brain barrier.                                                                              |
| <b>KA40.2</b>  | <b>Birth injury to spine or spinal cord</b><br>Injury to the spinal cord incurred during delivery from excessive traction or rotation, principally occurring during breech and rotational forceps during vertex deliveries                                                                                                                 |
| <b>KA40.3</b>  | <b>Birth injury to brainstem</b><br>Injury to the brain stem occurring during delivery due to excessive longitudinal traction especially when this traction is combined with flexion and torsion of the spine during delivery.<br><br><i><b>Exclusions:</b></i> Fracture, dislocation or subluxation of spine due to birth injury (KA45.4) |
| <b>KA40.Y</b>  | <b>Other specified birth injury to central nervous system</b>                                                                                                                                                                                                                                                                              |
| <b>KA40.Z</b>  | <b>Birth injury to central nervous system, unspecified</b>                                                                                                                                                                                                                                                                                 |
| <b>KA41</b>    | <b>Birth injury to eye</b><br>Ocular injuries due to birth trauma include lid lacerations, hyphema, rupture of Descemet's membrane of cornea, vitreous haemorrhage, corneal oedema, abrasions and lacerations, orbital haemorrhage and fractures, and intraocular haemorrhages.                                                            |
| <b>KA42</b>    | <b>Birth injury to scalp</b><br>A condition characterised by the presence of damage to the scalp due to physical pressure or injury during delivery.                                                                                                                                                                                       |
| <b>KA42.0</b>  | <b>Bruising of scalp due to birth injury</b><br>Erythema of the scalp occurring usually as a result of dystocia or application of forceps                                                                                                                                                                                                  |
| <b>KA42.1</b>  | <b>Cephalohaematoma due to birth injury</b><br>Cephalhaematoma is a subperiosteal collection of blood caused by rupture of vessels beneath the periosteum and does not extend across the suture lines.                                                                                                                                     |
| <b>KA42.2</b>  | <b>Chignon due to birth injury</b><br>Chignon is a temporary swelling (oedema of the scalp) secondary to the placement of a ventouse suction cup used in assisted vacuum deliveries. It usually disappears after several hours                                                                                                             |

|               |                                                                                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA42.3</b> | <b>Monitoring injury of scalp of newborn</b><br>Injuries to the scalp from use of intrapartum fetal monitoring devices including injury following fetal blood sampling.                                                                                           |
| <b>KA42.4</b> | <b>Subgaleal epicranial subaponeurotic haemorrhage due to birth injury</b><br>Subgaleal haemorrhage is a collection of blood in the space between the epicranial aponeurosis of the scalp and the periosteum of the skull.                                        |
| <b>KA42.Y</b> | <b>Other specified birth injury to scalp</b>                                                                                                                                                                                                                      |
| <b>KA42.Z</b> | <b>Birth injury to scalp, unspecified</b>                                                                                                                                                                                                                         |
| <b>KA43</b>   | <b>Birth injury to skin or soft tissues</b><br>Superficial injury including abrasions, lacerations and ecchymoses sustained during birth to sites other than scalp face and external genitalia<br><b>Exclusions:</b> Birth injury to scalp (KA42)                 |
| <b>KA43.0</b> | <b>Birth injury to sternocleidomastoid</b><br>Injury to the sternomastoid muscle due to birth usually presents with torticollis (tilt and rotation of head) and a firm, spindle-shaped, immobile mass in the midportion of sternomastoid muscle.                  |
| <b>KA43.1</b> | <b>Birth injury to external genitalia</b><br>Injuries of external genitalia such as oedema, ecchymoses, and haematomas of scrotum and labia majora, haematocoele, and trauma to the testes as a result of trauma during birth, especially after a breech delivery |
| <b>KA43.2</b> | <b>Subcutaneous fat necrosis due to birth injury</b><br>Subcutaneous fat necrosis is a rare acute transient hypodermatitis that develops within first weeks of life in term infants.<br><b>Exclusions:</b> Subcutaneous fat necrosis of the newborn (KC22.0)      |
| <b>KA43.3</b> | <b>Birth injury to face</b><br>Birth injuries to face include injuries sustained to nose (deviations, deformities, and septal damage), ears (abrasions, lacerations, deformities and haematomas).                                                                 |
| <b>KA43.Y</b> | <b>Other specified birth injury to skin or soft tissues</b>                                                                                                                                                                                                       |
| <b>KA43.Z</b> | <b>Birth injury to skin or soft tissues, unspecified</b>                                                                                                                                                                                                          |

## Infections of the fetus or newborn (KA60-KA6Z)

**Inclusions:** infections acquired in utero or during birth

**Exclusions:** human immunodeficiency virus [HIV] disease (1C60-1C62.Z)

Congenital pneumonia (KB24)

congenital gonococcal infection (1A70-1A7Z)

Asymptomatic human immunodeficiency virus infection (1C62.0)

Gastroenteritis or colitis of infectious origin (1A00-1A40.Z)

Laboratory evidence of human immunodeficiency virus (MA14.0)

**Coded Elsewhere:** Fetus or newborn affected by maternal infectious diseases (KA00.3)

Congenital syphilis (1A60)

### KA60

#### Sepsis of fetus or newborn

**Coded Elsewhere:** Bacterial infection of fetus or newborn due to other and unspecified streptococci (KA61.Z)

Bacterial infection of fetus or newborn due to other and unspecified staphylococci (KA61.Z)

### KA61

#### Other bacterial infections of the fetus or newborn

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Early congenital syphilis, latent (1A60.1)

Early congenital syphilis, symptomatic (1A60.0)

Neonatal necrotising fasciitis (1B71.2)

Tetanus neonatorum (1C15)

#### KA61.0

##### Congenital tuberculosis

A disease affecting infants, caused by an infection with the bacteria *Mycobacterium tuberculosis* in utero. Transmission is by vertical transmission.

#### KA61.1

##### Neonatal listeriosis

A condition affecting fetuses or neonates, caused by an infection with the gram-positive bacteria *Listeria*. This condition is characterised by respiratory distress and shock in the neonate, by stillbirth, or by abortion. Transmission is by vertical transmission. Confirmation is by identification of *Listeria* in the neonate and mother.

#### KA61.Z

##### Bacterial infection of the fetus or newborn, unspecified

**Coding Note:** Code also the causing condition

### KA62

#### Viral infection in the fetus or newborn

Any condition affecting fetuses or newborns, caused by an infection with a virus.

#### KA62.0

##### Congenital Zika virus infection

- KA62.1 Congenital Epstein-Barr virus infection**  
There are several forms of Epstein–Barr virus infection. Infectious mononucleosis, nasopharyngeal carcinoma, and Burkitt's lymphoma can all be caused by the Epstein–Barr virus.
- KA62.2 Congenital Varicella Zoster virus infection**  
Transplacentally acquired Varicella zoster virus infection. Both the gestational age at the time of maternal infection and the time interval between maternal infection and birth have major influences on the clinical course.
- KA62.3 Congenital cytomegalovirus infection**  
A condition affecting neonates, caused by an infection with cytomegalovirus in utero. This condition is characterised by jaundice, low birth weight, splenomegaly, hepatomegaly, or pneumonia if symptoms develop shortly after birth, or may be asymptomatic. This condition commonly presents later in life with loss of hearing, loss of vision, or developmental disabilities. Transmission is by vertical transmission. Confirmation is by detection of cytomegalovirus in neonatal urine, saliva, blood, or other body tissues within 2-3 weeks of birth.
- KA62.4 Congenital echovirus infection**  
A disease affecting neonates, caused by an infection with enteric cytopathic human orphan (ECHO) virus in utero. This disease presents with various symptoms depending on the site of the infection, or may be asymptomatic. Transmission is by vertical transmission. Confirmation is by identification of ECHO virus in the neonate.
- KA62.5 Congenital enterovirus infection**  
Congenital viral infections with enteroviruses (including coxsackie viruses and ECHO viruses) are infectious embryofetopathies that have been reported to cause fetal malformations, acute systemic illness in the newborn and long-term neurodevelopmental abnormalities.
- KA62.6 Congenital human immunodeficiency virus infection**  
A disease affecting neonates, caused by an infection with human immunodeficiency virus in utero. Transmission is by vertical transmission. Confirmation is by identification of human immunodeficiency virus in the neonate.
- KA62.7 Congenital parvovirus syndrome**  
Fetal parvovirus syndrome is a fetopathy likely to occur when a pregnant woman is infected by parvovirus B19. Fetal parvovirus infection results in aplastic crisis. Anaemia induces a risk of hydrops and fetal death by cardiac failure in 10 to 20% of cases.
- KA62.8 Congenital rubella syndrome**  
A disease caused by an infection with the rubella virus in utero. This disease presents with symptoms depending on the timing of infection of the fetus and may present with birth defects (such as hearing loss), or intrauterine growth retardation. Transmission is by vertical transmission. Confirmation is by identification of rubella virus or detection of anti-rubella virus IgM antibodies in the neonate or infant.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA62.9</b> | <b>Congenital viral hepatitis</b><br>A disease of the liver affecting the neonate, caused by an infection with either hepatitis A, B, C, D, or E virus in utero. This disease is characterised by lethargy, jaundice, abdominal distention, failure to thrive, or clay coloured stools. Transmission is by vertical transmission. Confirmation is by identification of the hepatitis A, B, C, D, or E virus in a blood sample from the neonate.                             |
| <b>KA62.A</b> | <b>Perinatal Herpes simplex infection</b><br>Herpes simplex infection acquired during the perinatal period, normally from active herpes infection of the mother's genital tract, but may also be transmitted in utero.                                                                                                                                                                                                                                                      |
| <b>KA62.Y</b> | <b>Other specified viral infection in the fetus or newborn</b>                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>KA62.Z</b> | <b>Viral infection in the fetus or newborn, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>KA63</b>   | <b>Fungal infection of fetus or newborn</b><br>Any condition affecting fetuses or newborns, caused by an infection with a fungal agent.                                                                                                                                                                                                                                                                                                                                     |
| <b>KA63.0</b> | <b>Malassezia infection in newborn</b><br>A condition affecting newborns, caused by an infection with Malassezia that leads to a severe systemic inflammatory response. This condition is characterised by fever or respiratory distress. Confirmation is by identification of Malassezia in a blood sample.                                                                                                                                                                |
| <b>KA63.1</b> | <b>Neonatal aspergillosis</b><br>A disease affecting neonates, caused by an infection with the fungi Aspergillus. This disease presents with clinical symptoms depending on the site of infection. Transmission is by inhalation of Aspergillus spores, or direct contact. Confirmation is by identification of Aspergillus from affected sites.                                                                                                                            |
| <b>KA63.2</b> | <b>Neonatal candidosis</b><br>A condition affecting neonates, caused by an infection with the fungi Candida. This condition is characterised by apnoea, thrombocytopenia, or decreasing respiratory function or other symptoms depending on the site of infection. Transmission is vertical (from the mother to the baby). Confirmation is by identification of Candida in a blood or urine sample.<br><br><b>Coded Elsewhere:</b> Neonatal mucocutaneous candidosis (EH12) |
| <b>KA63.Y</b> | <b>Other specified fungal infection of fetus or newborn</b>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>KA63.Z</b> | <b>Fungal infection of fetus or newborn, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                    |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA64.0</b> | <b>Congenital toxoplasmosis</b><br>A disease caused by an infection with the protozoan parasite <i>Toxoplasma gondii</i> in utero. This disease is characterised by chorioretinitis, hydrocephalus, intracranial calcifications, anaemia, or neurological deficits that develop after birth. This disease may present at birth with jaundice, premature birth, hepatosplenomegaly, myocarditis, pneumonitis, or rash. Transmission is by vertical transmission. In the fetus, confirmation is by identification of <i>Toxoplasma gondii</i> in amniotic fluid; in the neonate, confirmation is by identification of <i>Toxoplasma gondii</i> in body fluids or tissues, or detection of antibodies against <i>Toxoplasma gondii</i> . |
| <b>KA64.1</b> | <b>Congenital falciparum malaria</b><br>A disease caused by an infection with the protozoan parasite <i>Plasmodium falciparum</i> in utero. This disease is characterised by fever, anaemia, splenomegaly, hepatomegaly, jaundice, regurgitation, diarrhoea, or poor feeding. This disease may also present with respiratory distress, drowsiness, or cyanosis. Transmission is by vertical transmission. Confirmation is by identification of the <i>Plasmodium falciparum</i> in a blood sample from the neonate.                                                                                                                                                                                                                   |

|               | Fetal blood loss is a loss of blood from the fetal circulation during pregnancy, labour, or delivery. Due to the small volume of fetal blood that is present, even a small loss can lead to anaemia or fetal death.                                                                                                                                                                                        |
| <b>KA80.0</b> | <b>Fetal blood loss from vasa praevia</b>                                                                                                                                                                                                                                                                                                                                                                  |
|               | In vasa praevia, the fetal blood vessels connecting the placenta and umbilical cord cross the internal cervical os, the entrance to the birth canal, underneath the fetus.                                                                                                                                                                                                                                 |
| <b>KA80.1</b> | <b>Fetal blood loss from ruptured cord</b>                                                                                                                                                                                                                                                                                                                                                                 |
|               | The umbilical cord can rupture during labour and delivery and lead to fetal blood loss. Possible reasons include: traction on an abnormally short cord, a cord that is entangled around the fetus, a thin friable cord, or a cord with vascular abnormalities. Fetal blood loss can also occur following accidental cord puncture during amniocentesis or following in utero cordocentesis or transfusion. |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KA80.2</b> | <b>Fetal blood loss from placenta</b><br>Fetal blood loss can result from placental abruption, which is when the placenta separates from the uterine wall prior to delivery. Placental abruptions occur under conditions of maternal hypertension and drug use (e.g. cocaine), maternal vascular and collagen vascular disease, maternal clotting disorders, and following direct abdominal trauma. Fetal blood loss can also result from accidental incision of the placenta during a caesarean section. |
| <b>KA80.3</b> | <b>Haemorrhage into co-twin</b><br>Monozygous twins often share a placenta. Vascular anastomoses within the placenta allow for the transfer of blood between the two fetuses. In some cases, the flow is unbalanced and one fetus (larger, plethoric, and polycythaemic twin) has an overload of fluid, while the other (smaller, hydropic twin) becomes anaemic.                                                                                                                                         |
| <b>KA80.4</b> | <b>Haemorrhage into maternal circulation</b><br>Fetal-maternal haemorrhage occurs when the trophoblastic lining of the placenta fails to act as a barrier and allows fetal blood cells to enter the maternal circulation.                                                                                                                                                                                                                                                                                 |
| <b>KA80.5</b> | <b>Fetal blood loss from cut end of co-twin cord</b><br>Sometimes the blood content of monozygotic twins differs considerably, which can occur when anastomoses exist. One twin loses blood through shunts, while the other gains a large quantity of blood. Therefore, following the delivery of one twin, the other may bleed through these anastomoses if the umbilical cord of the delivered twin is not immediately clamped.                                                                         |
| <b>KA80.Y</b> | <b>Other specified fetal blood loss</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**KA8B Anaemia of prematurity**

A paediatric condition characterised by a decrease in number of red blood cells (RBCs) or less than the normal quantity of haemoglobin in the blood of a newborn associated with the child being born prior to completing 37 weeks of gestation.

**KA8C Congenital hypoplastic anaemia**

A paediatric condition characterised by a decreased number of red blood cells (RBCs) or lower than the normal levels of haemoglobin in the blood of a newborn present at birth due to loss of blood from the circulatory system of the fetus.

**KA8D Transient neonatal neutropaenia**

Neonatal neutropaenia can be due to underproduction of the marrow (e.g. hypoxemia due to placental insufficiency, congenital viral disease) or excessive utilization of white blood cells (bacterial sepsis) or due to maternal transfer of antibodies to the fetus

**Coding Note:** Code also the causing condition

**KA8E Alloimmune neonatal neutropaenia**

Alloimmune neonatal neutropaenia (ANN) is a disease caused by the passive transfer of neutrophil specific maternal IgG antibodies across the placenta during pregnancy.

**KA8F Neonatal vitamin K deficiency**

There are 3 forms of vitamin K–deficiency bleeding (VKDB) of the newborn. Early VKDB (haemorrhagic disease of the newborn) that occurs at 1-14 days of age. The most common sites of bleeding are the gastrointestinal tract, mucosal and cutaneous tissue, the umbilical stump, and the post-circumcision site. Late VKDB most commonly occurs at 2-12 weeks of age, although cases can occur up to 6 months. The most common site of bleeding is intracranial, although cutaneous and gastrointestinal bleeding may be initial manifestation. The third form of VKDB occurs at birth or shortly thereafter. It is secondary to maternal intake of medications (warfarin, phenobarbital, phenytoin) that cross the placenta.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>KA8F.0</b> | <b>Diffuse bleeding diathesis due to vitamin K deficient haemorrhagic disease of fetus or newborn</b><br>Haemorrhagic disease of the newborn is a bleeding disorder of the newborn usually seen in the first week after life when vitamin K replacement is not provided to the newborn infant immediately after birth and is primarily characterised by gastrointestinal bleeding. The disorder can also be seen later in the newborn period in breast fed infants of vitamin K deficient mothers. |
| <b>KA8F.Y</b> | <b>Other specified neonatal vitamin K deficiency</b>                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Respiratory disorders specific to the perinatal or neonatal period (KB20-KB2Z)

A group of conditions occurring during the period of time around childbirth, especially the five months before and one month after birth which are associated with the cardiovascular or respiratory systems.

**Coded Elsewhere:** Choanal atresia (LA70.2)

Congenital hypoplasia of lung (LA75.2)

Primary central sleep apnoea of infancy (7A40.1)

Primary central sleep apnoea of prematurity (7A40.2)

Late acquired pneumonia (CA40.Y)

### KB20

#### Intrauterine hypoxia

Intrauterine hypoxia occurs when the fetus is deprived of an adequate supply of oxygen. This may occur with prolapse or occlusion of the umbilical cord, placental infarction and maternal smoking. This can lead to damage of the central nervous system and neonatal encephalopathy, which increases the risk of mortality.

**Inclusions:** intrauterine distress

**Exclusions:** Intracranial nontraumatic haemorrhage of fetus or newborn (KA82)

Hypoxic ischaemic encephalopathy of newborn (KB04)

Metabolic acidaemia in newborn (KB22)

Late metabolic acidosis of newborn (KB63.0)

#### KB20.0

##### Intrauterine hypoxia first noted before onset of labour

A condition characterised by deprivation of an adequate supply of oxygen to the fetus during the gestation period which is diagnosed prior to the onset of labour.

#### KB20.1

##### Intrauterine hypoxia first noted during labour or delivery

A condition characterised by deprivation of an adequate supply of oxygen to the fetus diagnosed immediately prior to or during labour and delivery.

#### KB20.Z

##### Intrauterine hypoxia, unspecified

### KB21

#### Birth asphyxia

**Coding Note:** This category is not to be used for low Apgar score without mention of asphyxia or other respiratory problems.

**Exclusions:** intrauterine hypoxia or asphyxia (KB20)

#### KB21.0

##### Severe birth asphyxia

Pulse less than 100 per minute at birth and falling or steady, respiration absent or gasping, colour poor, tone absent.

#### KB21.1

##### Mild and moderate birth asphyxia

Normal respiration not established within one minute, but heart rate 100 or above, some muscle tone present, some response to stimulation.

#### KB21.Z

##### Birth asphyxia, unspecified

**Coding Note:** This category is not to be used for low Apgar score without mention of asphyxia or other respiratory problems.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**KB24****Congenital pneumonia**

Congenital pneumonia is an acute respiratory infection contracted prenatally or during the intrapartum period that is caused by a virus, bacteria, or fungi.

**Inclusions:** infective pneumonia acquired in utero or during birth

**Exclusions:** Neonatal aspiration syndromes (KB26)

Pneumonitis (CA70-CA7Z)

**KB25****Neonatal tracheitis**

A disease of the trachea in neonates, caused by an infection with a bacterial, viral, or fungal source. This disease is characterised by stridor, or increased respiratory effort. Transmission is commonly by inhalation of the infectious agent. Confirmation is by direct laryngoscopy.

**KB26****Neonatal aspiration syndromes**

Aspiration of meconium, blood, amniotic fluids and gastric contents in a neonate resulting in clinical symptoms from airway obstruction (atelectasis, air trapping and air leaks), parenchymal injury (pneumonitis), right-to-left shunting, and ventilation-perfusion mismatch.

**KB26.0****Neonatal aspiration of meconium**

Meconium Aspiration Syndrome (MAS) is defined as respiratory distress in an infant born through meconium-stained amniotic fluid with roentgenographic findings consistent with MAS and whose symptoms could not be otherwise explained.

**Exclusions:** Meconium passage during delivery (KA05.8)

Meconium staining (KD38)

**KB26.1****Neonatal aspiration of amniotic fluid or mucus**

Clinical symptoms of Neonatal aspiration syndrome due to inhalation of amniotic fluid

**KB26.2****Neonatal aspiration of blood**

Clinical symptoms of Neonatal aspiration syndrome due to inhalation of blood usually during birth process, or through aspiration of gastrointestinal bleeding.

**KB26.3****Neonatal aspiration of milk or regurgitated food**

Clinical symptoms of Neonatal aspiration syndrome due to aspiration of acidic gastric content and/or milk.

**KB26.Y****Other specified neonatal aspiration syndromes****KB26.Z****Neonatal aspiration syndromes, unspecified****KB27****Pulmonary air leak or related conditions originating in the perinatal period**

Clinical syndrome due to free air from rupture of overdistended alveoli tracking into pulmonary interstitium, mediastinum, pleural cavity or subcutaneous tissues.

|               |                                                                                                                                                                                                                                                                                                                                                       |

| <b>KB29.Z</b> | <b>Chronic respiratory disease originating in the perinatal period, unspecified</b>                                                                                                                                                                                                                                           |
| <b>KB2A</b>   | <b>Apnoea of newborn</b><br>Any condition characterised by suspension of external breathing in a newborn (premature or term) which is not classified elsewhere                                                                                                                                                                |
| <b>KB2A.0</b> | <b>Central neonatal apnoea</b><br>Central apnoea is a cessation of airflow > 20 seconds with loss of all respiratory effort. It is due to immaturity of the brainstem to control respiration. It is found in many premature infants and generally resolves by 36 weeks of age.                                                |
| <b>KB2A.1</b> | <b>Obstructive neonatal apnoea</b><br>Apnoea that occurs secondary to diminished airway airflow from an obstruction in the airway from the nose and mouth, tongue, hypopharynx, epiglottis, vocal cords or subglottic region. This is characterised by initial increased work of breathing and rapid progression to cyanosis. |
| <b>KB2A.2</b> | <b>Mixed neonatal apnoea</b><br>A combination of central apnoea and obstructive apnoea. Most apnoea of prematurity is of the mixed variety, and most often resolves by 36 weeks of age.                                                                                                                                       |
| <b>KB2A.3</b> | <b>Apnoea of newborn, due to neurologic injury</b>                                                                                                                                                                                                                                                                            |
| <b>KB2A.Y</b> | <b>Other specified apnoea of newborn</b>                                                                                                                                                                                                                                                                                      |

## Cardiovascular disorders present in the perinatal or neonatal period (KB40-KB4Z)

A group of conditions which begin during the period of time around childbirth, especially the five months before and one month after birth which are associated with the cardiovascular systems.

**Exclusions:** congenital malformations of the heart and circulatory system (LA80-LA8Z)

**Coded Elsewhere:** Patent arterial duct (LA8B.4)

| <b>KB47</b>   | <b>Benign or innocent cardiac murmurs in newborn</b><br>A paediatric condition characterised by heart sounds that are produced as a result of turbulent blood flow that is sufficient to produce audible noise primarily due to physiologic conditions outside the heart, as opposed to structural defects in the heart itself in a newborn. |

**KB48****Patent arterial duct of prematurity**

Patent arterial duct associated with the child being born prior to completing 37 weeks of gestation, in the absence of ductal-dependent congenital heart disease.

**KB4Y****Other specified cardiovascular disorders present in the perinatal or neonatal period****KB4Z****Cardiovascular disorders present in the perinatal or neonatal period, unspecified****Transitory endocrine or metabolic disorders specific to fetus or newborn (KB60-KB6Z)**

A group of paediatric conditions in which there is a temporary disorder in a newborn or infant associated with changes in hormone production or utilization (endocrine system) or when abnormal chemical reactions in the body disrupt the normal processes of enzyme catalyzed reactions within tissue cells (metabolism), such as getting or making energy from consumed food.

**KB60****Transitory disorders of carbohydrate metabolism specific to fetus or newborn**

A group of paediatric conditions in which there is a temporary disorder in a newborn or infant associated with abnormal chemical reactions in the body disrupting the process of getting or making energy from consumed carbohydrates.

**KB60.0****Syndrome of infant of mother with gestational diabetes**

Describes the range of effects on the infant born to a woman with gestational diabetes (onset or first recognition of carbohydrate intolerance of variable severity in pregnancy). Common neonatal effects include macrosomia, intrauterine growth restriction, birth injuries, congenital anomalies, hypoglycaemia, respiratory distress, and hypertrophic cardiomyopathy.

**KB60.1****Syndrome of infant of a diabetic mother, type 1 or 2, nongestational, insulin dependent**

Describes the range of effects on the infant born to a woman with pregestational diabetes mellitus (type 1 or type 2). Common neonatal effects include macrosomia, intrauterine growth restriction, birth injuries, congenital anomalies, hypoglycaemia, respiratory distress, caudal regression syndrome and hypertrophic cardiomyopathy.

**KB60.2****Neonatal diabetes mellitus**

Neonatal diabetes mellitus (NDM) is a monogenic form of diabetes that occurs in the first 6 months of life. It is a rare condition occurring in only one in 100,000 to 500,000 live births. Infants with NDM do not produce enough insulin, leading to an increase in blood glucose. NDM can be mistaken for the much more common type 1 diabetes, but type 1 diabetes usually occurs later than the first 6 months of life. In about half of those with NDM, the condition is lifelong and is called permanent neonatal diabetes mellitus (PNDM). In the rest of those with NDM, the condition is transient and disappears during infancy but can reappear later in life; this type of NDM is called transient neonatal diabetes mellitus (TNDM).

|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>KB60.20</b> | Transient neonatal diabetes mellitus<br>Transient neonatal diabetes mellitus (TNDM) is a developmental disorder of insulin production that resolves postnatally within the first year of life. Intrauterine growth restriction is usually present. TNDM infants develop diabetes in the first few weeks of life but may go into remission in a few months, with possible relapse to a permanent diabetes state usually around adolescence or as adults. The pancreatic dysfunction in this condition may be maintained throughout life, with relapse initiated at times of metabolic stress such as puberty or pregnancy. |
| <b>KB60.2Y</b> | Other specified neonatal diabetes mellitus                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>KB61.0</b> | <b>Neonatal hypomagnesaemia</b><br>Defined as serum magnesium levels less than 0.66 mmol/L (1.6 mg/L) in neonates. Symptoms usually do not develop until serum Magnesium (Mg) levels fall below 0.49 mmol/L (1.2 mg/L). This is usually transient but can cause symptoms similar to those of hypocalcaemia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>KB61.2</b> | <b>Neonatal hypocalcaemia</b><br>Hypocalcaemia is a common metabolic problem in newborns. In the neonate, hypocalcaemia is defined by birth weight (BW) categories. In infants with BW greater than 1500 g, hypocalcaemia is defined as a total serum calcium (Ca) concentration less than 8 mg/dL (2 mmol/L) or an ionized fraction of less than 4.4 mg/dL (1.1 mmol/L). In very low birth weight premature infants (BW<1500 g), hypocalcaemia is defined as a total serum Ca concentration less than 7 mg/dL (1.75 mmol/L) or an ionized fraction of less than 4 mg/dL (1 mmol/L). Aetiologies of early hypocalcaemia (occurs in the first two to three days after birth) include prematurity, maternal diabetes, birth asphyxia, and intrauterine growth. Causes of late hypocalcaemia (usually occurs at the end of the first week of life) include hypoparathyroidism and high phosphate intake. Most infants with hypocalcaemia are asymptomatic. If symptomatic, neuromuscular irritability is the most common sign with jitteriness and muscle jerking. Less common findings include seizures, and rarely laryngospasm, wheezing, or vomiting.<br><br><b>Exclusions:</b> Transitory neonatal hypoparathyroidism (KB64) |
| <b>KB61.3</b> | <b>Neonatal osteopenia</b><br>Metabolic bone disease is a common complication in very low birthweight (VLBW) preterm infants. The smallest, sickest infants are at greatest risk. Progressive osteopenia with demineralized bones and, occasionally, pathologic fractures may develop. The major cause is inadequate intake of calcium and phosphorus to meet the requirements for growth. Poor intake of vitamin D is an additional risk factor. Contributing factors include prolonged parenteral nutrition, vitamin D and calcium malabsorption, intake of unsupplemented human milk, immobilization, and urinary calcium losses from long-term diuretic use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>KB82</b>   | <b>Prenatal gastric perforation</b>                                                                                                                                                                                                                                                                              |
|               | Prenatal gastric perforation is a perforation or hole of the wall of the stomach that occurs while the baby is in utero. This is a rare and life-threatening condition in a neonate.                                                                                                                             |
| <b>KB83</b>   | <b>Postnatal gastric perforation</b>                                                                                                                                                                                                                                                                             |
|               | Postnatal gastric perforation is a spontaneous or traumatic penetration or hole of the wall of the stomach that occurs after birth. This is a rare and life-threatening condition in a neonate.                                                                                                                  |
| <b>KB84</b>   | <b>Postnatal isolated ileal perforation</b>                                                                                                                                                                                                                                                                      |
|               | Post natal bowel perforation, generally in the terminal ileum. Can be confused with necrotizing enterocolitis, but generally occurs earlier (2-5 days of age) and does not involve extensive bowel necrosis.                                                                                                     |
| <b>KB85</b>   | <b>Prenatal intrauterine intestinal perforation</b>                                                                                                                                                                                                                                                              |
|               | In-utero or prenatal bowel perforation results in a chemical peritonitis (meconium peritonitis) from peritoneal leakage of sterile meconium. Meconium peritonitis results from prenatal intestinal perforation nearly always involving the small bowel.                                                          |
|               | <b>Exclusions:</b> Meconium ileus with perforation (KB87.4)                                                                                                                                                                                                                                                      |

| <b>KB87.0</b> | <b>Intestinal obstruction due to inspissated milk</b><br>Mechanical intestinal obstruction in premature infants due to hard milk curds formed when high-energy formula or powdered milk is fed in the presence of reduced intestinal motility and increased absorption of water from the colon. The site of obstruction is the terminal ileum, the ileocaecal valve, or the colon. The manifestations include constipation, abdominal distension, and vomiting (progressively bilious or faecal).                                                                                                                         |
| <b>KB87.1</b> | <b>Meconium plug without ileus</b><br>Meconium plug, also referred to as functional immaturity of the colon, is an obstruction in the newborn colon. It is usually a transient disorder of the newborn and is characterised by delayed passage of meconium and intestinal dilatation.                                                                                                                                                                                                                                                                                                                                     |
| <b>KB87.2</b> | <b>Meconium ileus without perforation</b><br>The meconium sometimes becomes thickened and congested in the terminal ileum, a condition known as meconium ileus. Meconium ileus is among the most common causes of intestinal obstruction in the newborn, accounting for 9-33% of neonatal intestinal obstructions. A symptom of both Hirschsprung's disease and cystic fibrosis is the failure to pass meconium. Some babies have a blockage in their colon that may look like meconium ileus (a meconium plug), and they have small left colon syndrome. This means the last part of their colon is smaller than normal. |
| <b>KB87.3</b> | <b>Transitory ileus of newborn</b><br>Transient intestinal obstruction of functional rather than anatomical origin which is not uncommon in the first few days of life. As surgery may be strongly contraindicated in this group, the differential diagnosis is extremely important.<br><b>Exclusions:</b> Hirschsprung disease (LB16.1)                                                                                                                                                                                                                                                                                  |

**KB88****Necrotising enterocolitis of newborn**

This is a fulminating disease of neonates in which there is extensive mucosal ulceration, pseudomembrane formation, submucosal haemorrhage, and necrosis usually of the right colon, caecum, terminal ileum, and appendix (ENTEROCOLITIS), possibly due to perinatal intestinal ischemia and bacterial invasion. The entire colon, small intestine, stomach, and oesophagus may also be affected. Most infants are premature or suffer from respiratory distress syndrome, sepsis, or hypoxia. Symptoms (apparent during the first few weeks of life) include abdominal distension, bilious vomiting, and melaena; there may be apnoea, lethargy, temperature instability, tachycardia, tachypnoea, and a fall in blood pressure. The disorder may progress to perforation and peritonitis.

**KB88.0**                    **Necrotising enterocolitis of newborn, Stage 1A & B**

**KB88.1**                    **Necrotising enterocolitis of newborn, Stage 2A & B**

**KB88.2**                    **Necrotising enterocolitis of newborn, Stage 3A**

**KB88.3**                    **Necrotising enterocolitis of newborn, Stage 3B**

**KB88.Y**                    **Other specified necrotising enterocolitis of newborn**

**KB88.Z**                    **Necrotising enterocolitis of newborn, unspecified**

**KB89****Neonatal malabsorption syndromes**

**Coded Elsewhere:** Glucose or galactose intolerance of newborn (5C51.42)

Hereditary fructose intolerance (5C51.50)

**KB89.0**                    **Neonatal malabsorption due to endocrine secreting tumour**

**KB89.1**                    **Short bowel syndrome in neonate**

Short bowel syndrome in neonate is a condition originating in the perinatal period in which nutrients are not properly absorbed due to either surgical removal of a large portion of the small intestine or rarely due to the complete dysfunction of a large segment of small intestine.

**Exclusions:**                    Congenital short bowel (LB15.2)

**KB89.Y**                    **Other specified neonatal malabsorption syndromes**

**KB89.Z**                    **Neonatal malabsorption syndromes, unspecified**

**KB8A****Neonatal haematemesis or melaena due to swallowed maternal blood**

A less serious, self-limiting case of haematemesis and melena which can occur in newborns two to three days after delivery, due to swallowed maternal blood.

**KB8B****Neonatal peritonitis**

Neonatal peritonitis may be bacterial or chemical in origin. The majority of cases of bacterial peritonitis are due to intestinal perforations, ruptured omphaloceles, or ischemic intestinal necrosis. Although most babies had peritonitis secondary to intestinal perforation subsequent to intestinal obstruction, many instances are unexplained perforation, possibly secondary to defects in the intestinal musculature or visceral ischemia. The less common chemical peritonitis is due to prenatal intestinal perforation with extrusion of sterile meconium into the peritoneal cavity. The two types may coexist if an antenatal perforation remains open after birth, allowing bacterial contamination of the previously sterile peritoneum.

**KB8C****Noninfectious neonatal diarrhoea**

Non-infectious causes of diarrhoea in neonates. Childhood diarrhoea is most often caused by infection. Much less often, however, it is due to other causes - e.g., malabsorption or dietary intolerance, endocrine abnormalities, hormone-secreting tumours, pancreatic and liver dysfunction. Non-infectious causes of diarrhoea may have other systemic signs and symptoms. Neonates are at particular risk of dehydration and malnutrition.

**KB8Y****Other specified digestive system disorders of fetus or newborn****KB8Z****Digestive system disorders of fetus or newborn, unspecified**

## Genitourinary system disorders specific to the perinatal or neonatal period (KC00-KC0Z)

A group of conditions occurring during the period of time around childbirth, especially the five months before and one month after birth which are associated with the genitourinary system.

**KC00****Congenital hydrocele**

A paediatric condition characterised by the buildup of watery fluid around one or both testicles of a newborn that is present at birth.

**KC01****Congenital renal failure**

A severe irreversible decline in the ability of kidneys to remove wastes, concentrate urine, and maintain electrolyte balance; blood pressure; and calcium metabolism which existed at, or often before, birth.

**Inclusions:** Uraemia of newborn

**KC0Y****Other specified genitourinary system disorders specific to the perinatal or neonatal period****KC0Z****Genitourinary system disorders specific to the perinatal or neonatal period, unspecified**

## Disorders involving the integument of fetus or newborn (KC20-KC9Z)

**Coded Elsewhere:** Neonatal dermatoses due to maternal antibodies (KA07)

**KC20****Conditions involving the umbilical cord**

| <b>KC21</b>   | <b>Inflammatory dermatoses of the newborn</b><br>A range of inflammatory skin disorders presenting in the neonatal period.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>KC21.0</b> | <b>Neonatal acne</b><br>Acne presenting at birth or shortly afterwards, generally with predominantly comedonal lesions of the cheeks and a paucity of inflammatory lesions. It is thought to be due to hyperactivity of the sebaceous glands stimulated by neonatal androgens from the testes in boys and adrenals in girls.                                                                                                                                                                                                                |
| <b>KC21.1</b> | <b>Neonatal toxic erythema</b><br>Neonatal toxic erythema is a common rash in neonates, appearing in up to half of newborns carried to term, usually between day 2-5 after birth; it does not occur outside the neonatal period and typically resolves within first two weeks of life. It is characterised by blotchy erythema with crops of evanescent small white or yellow papules or pustules. It is a benign condition and is thought to cause no discomfort to the baby.<br><br><i>Inclusions:</i> Neonatal erythema toxicum          |
| <b>KC21.2</b> | <b>Perianal dermatitis of the newborn</b><br>Perianal dermatitis of the newborn presents with perianal erythema during the first week of life, which in more severe forms may progress to oedema and superficial erosion of perianal skin. Although it usually occurs alone, perianal dermatitis may sometimes be associated with primary irritant napkin dermatitis. It is commoner in infants receiving cow's milk formulations than in breast-fed infants; it is assumed that it represents an irritant response to faecal constituents. |

**KC22.1 Cold panniculitis of the newborn**  
Cold panniculitis resulting either from exposure of neonates to low environmental temperature or from local application of cold objects (e.g. ice packs for management of neonatal supraventricular tachycardia). The newborn are particularly susceptible as a result of a high saturated/unsaturated fat ratio in subcutaneous fat with a consequent elevation of the freezing point of fat.

**KC22.2 Sclerema neonatorum**  
Sclerema neonatorum is an uncommon condition which typically affects gravely ill, preterm neonates in the first week of life. It manifests as a diffuse hardening of skin and subcutaneous adipose tissue such that the skin cannot be pitted or picked up and pinched into a fold. Histologically there is minimal inflammation without fat necrosis. It is associated with a high mortality.

## Disturbances of temperature regulation of newborn (KD10-KD1Z)

Normal temperature of newborn is 36.5 degrees C (S.D. = 0.6 degrees C). Temperature above 38.0 and below 36.0 may be regarded as unusual and called hyper- or hypothermia.

| <b>KD12</b>   | <b>Hypothermia of newborn</b><br>Core body temperature of a newborn below -1SD (36.0 degrees C) compared with mean temperature (36.5 degrees of C).                                                                                                                                                                                                                                                                                                                                                                            |
| <b>KD12.0</b> | <b>Neonatal cold injury syndrome</b><br>Neonatal cold injury syndrome is characterised by a core body temperature below 35°C (95°F) due to exposure of the newborn to prolonged or extremely low environmental temperatures. Clinically it is characterised by coldness to touch, apathy, immobility, decreased urine output and refusal of food. In addition oedema and redness of the extremities, especially the hands, feet, and face, are observed. It is commonly fatal and survivors may have evidence of brain damage. |

| <b>KD32.Z</b>       | <b>Feeding problems of newborn, unspecified</b>                                                                                                                                                                                                                                                                  |
| <b>KD33</b>         | <b>Jittery baby, not elsewhere classified</b><br>Jitteriness can occur on the first day of life. It can be caused by hypoglycaemia, hypocalcaemia, drug withdrawal, or other conditions.                                                                                                                         |

**KD34****Reactions or intoxications due to drugs administered to fetus or newborn**

A group of paediatric substance-induced conditions associated with health interventions applied to a fetus or newborn using pharmaceutical products.

- Exclusions:**
- Withdrawal symptoms from therapeutic use of drugs in newborn (KD36)
  - Neonatal hyperbilirubinaemia due to drugs or toxins transmitted from mother (KA87.4)
  - reactions and intoxications from maternal opiates, tranquillizers and other medication (KA06.0)
  - Neonatal withdrawal syndrome from maternal use of drugs of addiction (KD35)
  - Neonatal hyperbilirubinaemia due to drugs or toxins given to newborn (KA87.5)

**KD35****Neonatal withdrawal syndrome from maternal use of drugs of addiction**

Intrauterine exposure to addictive drugs can lead to neonatal withdrawal symptoms. Withdrawal symptoms are usually neurological, preventing normal autonomic function. The clinical presentation of drug withdrawal is variable and dependent on several factors, such as, the type and dose of drug used and rate of metabolism and excretion of the mother and infant.

- Inclusions:**
- Drug withdrawal syndrome in infant of dependent mother
  - Neonatal abstinence syndrome
- Exclusions:**
- Fetus or newborn affected by maternal anaesthesia or analgesia in pregnancy, labour or delivery (KA06.0)

**KD36****Withdrawal symptoms from therapeutic use of drugs in newborn**

A paediatric condition characterised by the presence of symptoms due to drug withdrawal in a newborn.

**KD37****Exposure to tobacco smoke in the perinatal period**

Exposure to tobacco smoke in the perinatal period, both directly or through second hand smoke, can lead to: low birth weight, preterm delivery, Sudden Infant Death Syndrome (SIDS or cot death), spontaneous abortion, or intrauterine growth retardation.

- Exclusions:**
- Fetus or newborn affected by maternal use of tobacco (KA06.1)

**KD38****Meconium staining**

Green or yellowish appearing amniotic fluid, indicating presence of meconium. The newborn's skin, nail beds or the umbilical cord may be stained.

- Exclusions:**
- Neonatal aspiration of meconium (KB26.0)
  - Meconium passage during delivery (KA05.8)

| <b>KD39</b>   | <b>Complications of intrauterine procedures, not elsewhere classified</b><br>A group of conditions characterised as an unfavourable evolution of a condition (complication) due to a health intervention applied inside of the uterus.<br><i><b>Exclusions:</b></i> fetus and newborn affected by placental separation and haemorrhage due to intrauterine procedures (KA02)                                                                                                                                                                                                                                                                                                                                                   |
| <b>KD39.0</b> | <b>Fetus or newborn affected by amniocentesis</b><br>Amniocentesis involves extracting a small sample of amniotic fluid surrounding the fetus. Risks include miscarriage or injury if the needle comes into contact with the fetus or placenta.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>KD39.1</b> | <b>Fetus or newborn affected by chorionic villous sampling</b><br>Chorionic villus sampling (CVS) is a procedure where a small sample of the placenta is removed, either through the cervix or abdomen. Risks when performing CVS include: injury to the fetus or mother from the needle, infection to the mother from a punctured bowel or contaminated skin, or Rhesus sensitisation. Injury or infection can lead to miscarriage, although this is rare.                                                                                                                                                                                                                                                                    |
| <b>KD39.2</b> | <b>Fetus or newborn affected by fetal blood sampling</b><br>Fetal blood sampling involves extracting a sample of fetal blood from the umbilical cord using a needle and an ultrasound as a guide. It is used to detect fetal abnormalities and is generally performed after the completion of 18 weeks of gestation. Risks to the fetus and newborn include: miscarriage, bleeding from the needle entry site, uterine infection and temporary slowing of the baby's heart rate following the procedure.<br><i><b>Inclusions:</b></i> Fetus or newborn affected by cordocentesis                                                                                                                                               |
| <b>KD39.3</b> | <b>Fetus or newborn affected by complications of fetal surgery</b><br>A condition in the fetus due to an unfavourable evolution of a condition (complication) associated with a surgical health intervention applied to the fetus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>KD39.4</b> | <b>Fetus or newborn affected by complications of intrauterine fetal surgery</b><br>Fetal surgery is the surgical treatment of a fetus still present in the uterus. It is performed when the fetus is suffering from a birth defect and is not expected to survive the delivery or live long after birth. It allows for the fetus to survive to birth, so that further corrective surgery can then be performed. Fetal surgery can be done in the following ways: fetoscopic surgery by using a fiberoptic scope to enter the uterus through small surgical openings, open fetal surgery by performing a hysterotomy which is an opening of the uterus, or radiofrequency ablation which cuts off the blood supply to a tumour. |
| <b>KD39.Y</b> | <b>Other specified complications of intrauterine procedures, not elsewhere classified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>KD39.Z</b> | <b>Complications of intrauterine procedures, not elsewhere classified, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**KD3A****Termination of pregnancy, affecting surviving fetus or newborn**

Termination of pregnancy (TOP) refers to a medically directed miscarriage, and this can be performed using pharmacological or surgical methods.

**Exclusions:** termination of pregnancy (affecting mother) (JA00.1)

**KD3B****Fetal death, cause not specified**

Fetal death is death of a fetus prior to its complete expulsion or extraction from a woman, irrespective of the duration of pregnancy. Fetal death may be diagnosed in utero by absence of fetal heart sounds, confirmed by imaging techniques where available, or after delivery by absence of signs of life after the complete expulsion or extraction from the woman.

Stillbirth is the complete expulsion or extraction from a woman of a fetus, following its death prior to the complete expulsion or extraction, at 22 or more completed weeks of gestation.

**Coding Note:** Not to be used for the underlying cause of death of live births.

Not to be used for the underlying cause of fetal death, if any other cause of fetal mortality is known.

**Inclusions:**

- stillbirth NOS
- stillborn NOS
- osteopiedion fetus
- lithopedion fetus
- fetus maceration
- calcified fetus

**KD3B.0****Antepartum fetal death**

Antepartum fetal death is a fetal death before the onset of labour. If vital status of the fetus at the onset of labour is unknown, consider it was antepartum if there is presence of signs of maceration at the time of delivery.

Macerated stillbirth - is the complete expulsion or extraction from a woman of a fetus following a fetal death at 22 or more completed weeks of gestation; or if gestational age is not available with a birthweight of 500g or more with skin showing signs of maceration.

Antepartum stillbirth - is the complete expulsion or extraction from a woman of a fetus following an antepartum fetal death at 22 or more completed weeks of gestation; or if gestational age is not available with a birthweight of 500 grams or more.

**Coding Note:** Not to be used for the underlying cause of death of live births.

Not to be used for the underlying cause of fetal death, if any other cause of fetal mortality is known.

**Inclusions:**

- macerated stillbirth
- antepartum stillbirth

**KD3B.1      Intrapartum fetal death**

Intrapartum fetal death is a fetal death during labour. If vital status of the fetus at the onset of labour is unknown, consider it was intrapartum if there is fresh skin appearance or no signs of maceration at the time of delivery.

Intrapartum stillbirth - is the complete expulsion or extraction from a woman of a fetus following an intrapartum fetal death at 22 or more completed weeks of gestation; or if gestational age is not available with a birthweight of 500 grams or more.

**Coding Note:** Not to be used for the underlying cause of death of live births.

Not to be used for the underlying cause of fetal death, if any other cause of fetal mortality is known.

**Inclusions:**                intrapartum stillbirth  
                                      fresh stillbirth

**KD3B.Z      Unspecified time of fetal death, cause not specified**

**Coding Note:** Not to be used for the underlying cause of death of live births.

Not to be used for the underlying cause of fetal death, if any other cause of fetal mortality is known.

**KD3C      Vomiting in newborn**

A paediatric condition characterised by the forceful expulsion of the contents of the stomach through the mouth and sometimes the nose of a newborn.

**KD3C.0      Bilious vomiting of newborn****KD3C.Y      Other specified vomiting in newborn****KD3C.Z      Vomiting in newborn, unspecified****KD3Y      Other specified disorders originating in the perinatal period**

---

**KD5Z      Conditions originating in the perinatal or neonatal period, unspecified**

**Coding Note:** Conditions arising in the perinatal period, even though death or morbidity occurs later, should, as far as possible, be coded to chapter 19, which takes precedence over chapters containing codes for diseases by their anatomical site.

For children less than 28 days old, assume that a reported condition developed in the perinatal period, unless the duration is stated and the onset was after the first completed week of life.

## CHAPTER 20

---

### Developmental anomalies

This chapter has 221 four-character categories.

Code range starts with LA00

This chapter includes conditions caused by failure of a particular body site or body system to develop correctly during the antenatal period.

**Exclusions:** Inborn errors of metabolism (5C50-5C5Z)

This chapter contains the following top level blocks:

- Structural developmental anomalies primarily affecting one body system
- Multiple developmental anomalies or syndromes
- Chromosomal anomalies, excluding gene mutations

#### Structural developmental anomalies primarily affecting one body system (LA00-LD0Z)

A deformation established before birth of an anatomical structure.

#### Structural developmental anomalies of the nervous system (LA00-LA0Z)

Any condition caused by failure of the nervous system to correctly develop during the antenatal period.

##### **LA00**

#### **Anencephaly or similar anomalies**

A malformation of the nervous system caused by the failure of neuropore closure. Infants are born with intact spinal cord, cerebellum, and brainstem, but lack formation of neural structures above this level. The skull is only partially formed but the eyes are usually normal.

##### **LA00.0**

#### **Anencephaly**

Anencephaly is a neural tube defect, characterised by the total or partial absence of the cranial vault and the covering skin, the brain being missing or reduced to a small mass. Most cases are stillborn, although some infants have been reported to survive for a few hours. In most cases autopsy findings reveal absence of adrenal glands. Anencephaly is likely to be multifactorial, the result of gene-environment interactions. Familial cases with a seemingly autosomal recessive mode of inheritance have been described but most cases are sporadic. Folic acid and zinc deficiencies, as well as maternal obesity, have been shown to be risk factors.

| <b>LA00.00</b> | <b>Craniorachischisis</b><br>A condition caused by failure of the neural tube to close completely during the antenatal period. This condition is characterised by complete absence of the skull, extensive defects in the vertebrae and skin, and absence of the brain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>LA00.0Y</b> | <b>Other specified anencephaly</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LA00.0Z</b> | <b>Anencephaly, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>LA00.1</b>  | <b>Iniencephaly</b><br>Iniencephaly is a rare form of neural tube defect in which a malformation of the cervico-occipital junction is associated with a malformation of the central nervous system. The cardinal features are occipital bone defect, partial or total absence of cervicothoracic vertebrae, fetal retroflexion of the head and characteristic absence of the neck. It is associated with malformations of the central nervous (spina bifida and/or anencephaly), gastrointestinal (omphalocele) and cardiovascular systems.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>LA00.2</b>  | <b>Acephaly</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>LA00.3</b>  | <b>Amyelencephaly</b><br>Amyelencephaly is the absence of both the brain and spinal cord.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

This condition may present with herniation of brain, or developmental delay. Confirmation is through observation of herniated meninges by imaging.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LA02</b>    | <b>Spina bifida</b><br>Spina bifida is the most common of a group of birth defects called neural tube defects. Spina bifida affects the backbone and, sometimes, the spinal cord. Aperta spina bifida defines the dorsal malclosure of vertebrae, associated with various degrees of spine defects. A pocket of skin may form, containing meninges (meningocele) or spinal cord and meninges (myelomeningocele). Different subtypes are distinguished according to the location of the defect. Consequences are paraplegia (paralysed lower limbs), hydrocephaly, Chiari malformation (result of the attached spine during life in utero), urinary and anorectal incontinence. The intensity of signs varies greatly with the level and extent of the lesion.<br><br><b>Inclusions:</b> Rachischisis<br>Spinal dysraphism<br><br><b>Exclusions:</b> Arnold-Chiari malformation type I (LA07.4)<br>Arnold-Chiari malformation type II (LA03)<br>Occult spinal dysraphism (LB73.0) |

**LA03****Arnold-Chiari malformation type II**

A condition caused by failure of the brain and spinal cord to correctly develop during the antenatal period. This condition is characterised by extension of both cerebellar and brain stem tissue into the foramen magnum. This condition may present with partial or complete absence of the cerebellar vermis, myelomeningocele, neck pain, balance problems, muscle weakness, limb numbness, dizziness, vision problems, difficulty swallowing, ringing in the ears, hearing loss, vomiting, insomnia, depression, or impairment of motor skills.

**Exclusions:** Arnold-Chiari malformation type I (LA07.4)

**LA04****Congenital hydrocephalus**

A disease caused by failure of the brain to correctly develop during the antenatal period. This condition is characterised by a rapid increase in head circumference or an unusually large head size due to excessive accumulation of cerebrospinal fluid in the brain. This condition may also present with vomiting, sleepiness, irritability, downward deviation of the eyes, or seizures. Confirmation is through observation of cerebrospinal fluid within cerebral ventricles by imaging.

**Inclusions:** Hydrocephalus in newborn

**Exclusions:** Myelomeningocele with hydrocephalus (LA02.00)  
Hydrocephalus due to congenital toxoplasmosis (KA64.0)  
Arnold-Chiari malformation type I (LA07.4)  
Arnold-Chiari malformation type II (LA03)

**LA04.0****Hydrocephalus with stenosis of the aqueduct of Sylvius**

Hydrocephalus with stenosis of aqueduct of Sylvius (HSAS) or Bickers-Adams syndrome is characterised by the association of hydrocephaly, severe intellectual deficit, spasticity and adducted thumbs, and is part of the L1 syndrome (see this term).

**Inclusions:** Stenosis of the aqueduct of Sylvius

**LA04.Y****Other specified congenital hydrocephalus****LA04.Z****Congenital hydrocephalus, unspecified****LA05****Cerebral structural developmental anomalies**

Any condition caused by failure of the brain to correctly develop during the antenatal period.

**Exclusions:** Encephalocele (LA01)

**LA05.0****Microcephaly**

A condition caused by failure of the head to correctly develop during the antenatal period. This condition is characterised by a head size that is significantly smaller than normal for their age and sex. This condition may also present with developmental delays, difficulties with balance and coordination, short stature, hyperactivity, mental retardation, seizures, or other neurological abnormalities.

**Coding Note:** Code also the causing condition

**Inclusions:** Micrencephaly

**Exclusions:** Syndromes with microcephaly as a major feature (LD20.2)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>LA05.1</b>  | <b>Megalencephaly</b><br>A condition caused by failure of the brain to correctly develop during the antenatal period. This condition is characterised by increased size or weight of an otherwise correctly formed brain. This condition may also present with seizures, motor deficits, mental retardation and mild cognitive impairment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LA05.2</b>  | <b>Holoprosencephaly</b><br>Holoprosencephaly is a brain malformation resulting from incomplete cleavage of the prosencephalon, occurring between the 18th and the 28th day of gestation and affecting both the forebrain and the face. In most of the cases, facial anomalies are observed: cyclopia, proboscis and median or bilateral cleft lip/palate in severe forms, and ocular hypotelorism or solitary median maxillary central incisor in minor forms. These latter midline defects can occur without the cerebral malformations (microforms). Children with HPE have many medical problems: developmental delay and feeding difficulties, epilepsy, and instability of temperature, heart rate and respiration. Endocrine disorders like diabetes insipidus, adrenal hypoplasia, hypogonadism, thyroid hypoplasia and growth hormone deficiency are frequent.<br><br><b>Coded Elsewhere:</b> Cyclopia (LA10.Y) |
| <b>LA05.3</b>  | <b>Corpus callosum agenesis</b><br>Corpus callosum agenesis is the most common brain malformation and is characterised by total or partial absence of the main interhemispheric commissure, the corpus callosum.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>LA05.4</b>  | <b>Arrhinencephaly</b><br>A condition caused by failure of the olfactory organs to correctly develop during the antenatal period. This condition is characterised by absence of the olfactory bulbs and tracts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>LA05.5</b>  | <b>Abnormal neuronal migration</b><br>Any condition caused by abnormal migration of neuronal cells during the antenatal period. These conditions may present with poor muscle tone and motor function, seizures, developmental delays, mental retardation, failure to grow and thrive, difficulties with feeding, swelling in the extremities or microcephaly.<br><br><b>Exclusions:</b> Lissencephaly (LD20.1)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>LA05.50</b> | <b>Polymicrogyria</b><br>Polymicrogyria (PMG) is a cerebral cortical malformation characterised by excessive cortical folding and by shallow sulci. Microscopic examination reveals abnormal cortical layering. Topographic distribution of PMG is variable, but bilateral symmetrical perisylvian PMG (BPP) is the most frequent form. PMG is manifested by mild intellectual deficit, epilepsy, and pseudobulbar palsy, which causes difficulties with speech learning and feeding. The severity of PMG is highly dependent on the location and size of the affected area.                                                                                                                                                                                                                                                                                                                                             |
| <b>LA05.51</b> | <b>Cortical dysplasia</b><br>A condition caused by failure of the cortex to correctly develop during the antenatal period, or by trauma. This condition is characterised by epileptic seizures. This condition may also present with learning impairments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| LA06.0      | <b>Dandy-Walker malformation</b><br>Dandy-Walker malformation is the association of three signs: hydrocephalus, partial or complete absence of the cerebellar vermis, and posterior fossa cyst contiguous with the fourth ventricle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LA06.1      | <b>Hypoplasia or agenesis of cerebellar hemispheres</b><br>Cerebellar hypoplasia corresponds to underdevelopment of cerebellar structures that can involve the vermis and/or the cerebellar hemispheres from partial to total agenesis. It has been described in the context of various clinical entities: chromosomal anomalies, in utero exposure to toxins and infectious agents, metabolic disorders (disorders of glycosylation and CoQ10 deficiencies), and a wide variety of rare genetic neurological diseases. It can be confined to the cerebellum, or affect other CNS structures: the midbrain (molar tooth syndromes), pons and medulla (ponto-cerebellar hypoplasia), cerebral cortex (lissencephaly cerebellar hypoplasia syndromes).<br><br><i><b>Exclusions:</b></i> PHACE syndrome (LD2F.1) |
| LA06.2      | <b>Focal cerebellar dysplasia</b><br>A condition caused by failure of the cerebellum to correctly develop during the antenatal period. This condition may present with hypotonia, facial deformities, abnormalities in eyes or in ocular motricity, cognitive deficiencies, or motor dysfunction. Confirmation is through observation of a malformed cerebellum by imaging.                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**LA1Y**      **Other specified structural developmental anomalies of the eye, eyelid or lacrimal apparatus**

**LA1Z**      **Structural developmental anomalies of the eye, eyelid or lacrimal apparatus, unspecified**

Structural developmental anomalies of the ear (LA20-LA2Z)

Any condition caused by failure of the ear to correctly develop during the antenatal period.

**LA20**      **Structural anomaly of eustachian apparatus**

**LA21**      **Minor anomalies of pinnae**

Any condition caused by failure of the pinna to correctly develop during the antenatal period. These conditions are characterised by asymptomatic abnormalities of the visible part of the ear.

**LA21.0**      **Macrotia**

1) Median longitudinal ear length greater than 2 SD above the mean and median ear width greater than 2 SD above the mean (objective).

2) Apparent increase in length and width of the pinna (subjective).

**LA21.1**      **Protruding ear**

**LA21.2**      **Low-set ear**

The upper third of the pinna is not above a plane defined by the lateral canthi and the maximum convexity of the occiput.

**Exclusions:**      cervical auricle (LA23)

**LA21.3**      **Misshapen ear**

A condition caused by the malformation of the ear during the antenatal period.

**Exclusions:**      Acquired deformity of pinna (AA41)

**LA21.Y**      **Other specified minor anomalies of pinnae**

**LA21.Z**      **Minor anomalies of pinnae, unspecified**

**LA22**      **Structural developmental anomalies of ear causing hearing impairment**

Any condition caused by the failure of the ear to correctly develop during the antenatal period. These conditions are characterised by hearing impairment.

| <b>LA22.0</b> | <p><b>Microtia</b></p> <p>Microtia is a congenital malformation of variable severity of the external and middle ear. Both hereditary factors (evidence for familial craniofacial microsomia and patterns suggestive of multifactorial inheritance)</p> <p>and vascular accidents are involved in the etiology of the disease. Specific causative factors also can include maternal rubella during the first trimester of pregnancy. Microtia commonly involves the external canal and middle ear; hence, hearing can be affected. Microtia may present within a spectrum of branchial arch defects (hemifacial microsomia, craniofacial microsomia) or may manifest as an independent malformation. The microtic auricle consists of a disorganised remnant of cartilage attached to a variable amount of soft tissue lobule.</p> |

Structural developmental anomalies of the face, mouth or teeth (LA30-LA5Z)

Any condition caused by failure of the face, mouth and teeth to correctly develop during the antenatal period.

**Coded Elsewhere:** Dermoid cyst (LC40)

Congenital micrognathia (DA0E.00)

## LA30

### Structural developmental anomalies of teeth and periodontal tissues

**Coded Elsewhere:** Disturbances in tooth formation (DA07.3)

Root anomaly (DA07.4)

Disturbances in tooth eruption (DA07.6)

Anomalies of tooth position (DA0E.3)

#### LA30.0

##### Anodontia

Anodontia is a genetic disorder commonly defined as the absence of all teeth, affecting both temporary and permanent dentitions, and is extremely rarely encountered in a pure form without any associated abnormalities. Rare but more common than complete anodontia is hypodontia.

#### LA30.1

##### Hypodontia

Hypodontia presents as a lack of one or a few (less than 6) permanent teeth, without any systemic disorders.

**Inclusions:** Congenital absence of one tooth

#### LA30.2

##### Oligodontia

A genetic condition characterised by the development of fewer than the normal number of teeth. The diagnosis of Oligodontia is usually made in cases in which more than six teeth are missing.

#### LA30.3

##### Hyperdontia

Hyperdontia is the condition of having supernumerary teeth, or teeth which appear in addition to the regular number of teeth.

**Inclusions:** Supplementary teeth  
Supernumerary teeth  
distomolar  
Fourth molar  
Mesiodens  
Paramolar

#### LA30.4

##### Abnormalities of size or form of teeth

A group of conditions characterised by abnormal size and form of teeth.

#### LA30.5

##### Anomalies in tooth resorption or loss

**Coded Elsewhere:** Pathological resorption of teeth (DA08.14)

#### LA30.50

Early exfoliation of teeth

#### LA30.51

Late exfoliation of teeth

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>LA30.6</b>  | <p><b>Amelogenesis imperfecta</b></p> <p>Amelogenesis imperfecta presents with a rare abnormal formation of the enamel or external layer of the crown of teeth. Amelogenesis imperfecta is due to the malfunction of the proteins in the enamel: ameloblastin, enamelin, tuftelin and amelogenin. People afflicted with amelogenesis imperfecta have teeth with abnormal colour: yellow, brown or grey; this disorder can afflict any number of teeth of both dentitions. The teeth have a higher risk for dental cavities and are hypersensitive to temperature changes as well as rapid attrition, excessive calculus deposition, and gingival hyperplasia.</p> |
| <b>LA30.7</b>  | <p><b>Dentine dysplasia</b></p> <p>#DRAFT# This is a genetic disorder of teeth, commonly exhibiting an autosomal dominant inheritance, which is characterised by presence of normal enamel but atypical dentin with abnormal pulpal morphology.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LA30.8</b>  | <p><b>Dentinogenesis imperfecta</b></p> <p>#DRAFT# This is a genetic disorder of tooth development, that causes teeth to be discoloured (most often a blue-grey or yellow-brown colour) and translucent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|               | Congenital macrostomia or transverse facial cleft is a rare congenital craniofacial anomaly. It is usually associated with deformities of other structures developed from the first and second branchial arches and is thought to be part of the manifestations of hemifacial microsomia, the second most common congenital craniofacial anomaly. |

## Clefts of lip, alveolus or palate (LA40-LA4Z)

A condition caused by failure of the structures of the mouth to correctly develop during the antenatal period. This condition is characterised by a fissure extending across the upper lip, nasal base, alveolar ridge or the palate. This condition may present with disruption of sucking or swallowing in neonates, recurrent otitis, transmission hypoacusia, or abnormalities of the maxillary lateral incisor.

| <b>LA50</b>   | <b>Congenital velopharyngeal incompetence</b><br>A condition caused by failure of the velum to correctly develop during the antenatal period. This condition is characterised by improper closing of the velopharyngeal sphincter, nasal speech, and difficulties in pronouncing certain letters or words.                            |
| <b>LA51</b>   | <b>Facial clefts</b><br>Any condition caused by failure of the structures of the face to correctly develop during the antenatal period. These conditions are characterised by a partition in bone, soft tissue, or skin of the face.<br><br><b>Exclusions:</b> Frontofacionasal dysostosis (LD25.3)<br>Frontonasal dysplasia (LD25.3) |
| <b>LA52</b>   | <b>Facial asymmetry</b><br>A condition caused by failure of the face to develop symmetrically during the antenatal period.                                                                                                                                                                                                            |
| <b>LA53</b>   | <b>Macrocheilia</b><br>A condition characterised by above normal lip volume. This condition may present with difficulties in speaking, drinking, salivary control, or mastication.                                                                                                                                                    |

**LA54****Microcheilia**

A condition caused by failure of the lips to develop correctly during the antenatal period. This condition is characterised by below normal lip size.

**LA55****Compression facies**

A disease caused by neurovascular compression of the facial nerve. This disease is characterised by facial spasm, and abnormal facial expression.

**LA56****Pierre Robin syndrome**

Pierre-Robin syndrome (or Pierre-Robin sequence) is characterised by triad of orofacial morphological anomalies consisting of retrognathism, glossoptosis and a posterior median velopalatal cleft. This condition is referred to as a sequence because the posterior cleft palate is a secondary defect associated with abnormal mandibular development: mandibular hypoplasia occurring early in gestation causes the tongue to be maintained high-up in the oral cavity, preventing fusion of the palatal shelves.

**LA5Y****Other specified structural developmental anomalies of the face****LA5Z****Structural developmental anomalies of the face, unspecified**

Structural developmental anomalies of the neck (LA60-LA6Z)

Any condition caused by failure of the neck to correctly develop during the antenatal period.

**Coded Elsewhere:** Thyroglossal cyst (DA05.Y)

**LA60****Webbed neck**

A condition caused by failure of the tissues of the neck to correctly develop during the antenatal period. This condition is characterised by a broad neck due to lateral folds of skin. This condition may present with limited range of motion of the neck.

**Inclusions:** Pterygium colli

**LA61****Congenital sternomastoid tumour****LA62****Congenital torticollis****LA6Y****Other specified structural developmental anomalies of the neck****LA6Z****Structural developmental anomalies of the neck, unspecified**

Structural developmental anomalies of the respiratory system (LA70-LA7Z)

**LA70****Structural developmental anomalies of the nose or cavum**

Any condition caused by failure of the nose and cavum to correctly develop during the antenatal period.

**LA70.0****Arrhinia**

Also called nasal agenesis, it is a very rare anomaly in which external nose does not develop and the nasal cavity is totally or partially obliterated.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>LA72</b>   | <b>Laryngotracheoesophageal cleft</b><br>A laryngo-tracheo-oesophageal cleft (LC) is a congenital malformation characterised by an abnormal, posterior, sagittal communication between the larynx and the pharynx, possibly extending downward between the trachea and the oesophagus. Five types of laryngo-tracheo-oesophageal cleft have been described based on the downward extension of the cleft, which typically correlates with the severity of symptoms: Type 0 laryngo-tracheo-oesophageal cleft to Type 4 laryngo-tracheo-oesophageal cleft (see these terms). |

| LA75.4      | <b>Congenital pulmonary airway malformations</b><br>A disease caused by failure of the bronchial structure to correctly develop during the antenatal period. This disease may present with severe respiratory distress in the newborn period, acute respiratory distress or infection later in life, or may be asymptomatic. This disease can be distinguished from other lesions and normal lung by polypoid projections of the mucosa, an increase in smooth muscle and elastic tissue within the cyst walls, an absence of cartilage in the cystic parenchyma, mucous secreting cells, and the absence of inflammation.<br><i>Inclusions:</i> Congenital honeycomb lung<br>Congenital polycystic disease of lung<br><i>Exclusions:</i> Cystic lung disease, acquired or unspecified (CB40) |
| LA75.5      | <b>Congenital lobar emphysema</b><br>Congenital lobar emphysema is a developmental lung anomaly characterised by over distension of the affected lobe and leading to compression and displacement of adjacent normal lung tissue and mediastinum. In the majority of cases, symptoms appear during the neonatal period or in early childhood. Clinically, children present with signs of respiratory distress, frequently occurring with a lower respiratory tract infection that aggravates air trapping and renders the patient symptomatic.                                                                                                                                                                                                                                                |
| LA75.6      | <b>Congenital sequestration of lung</b><br>A medical condition wherein a piece of tissue that ultimately develops into lung tissue is not attached to the pulmonary arterial blood supply, as is the case in normally developing lung. As a result, this sequestered tissue is not connected to the normal bronchial airway. With intralobar sequestration, the lung tissue lies within the same visceral pleura as the lobe in which it occurs. With extralobar sequestrations, an accessory lung is contained within its own pleura.                                                                                                                                                                                                                                                        |
| LA75.Y      | <b>Other specified structural developmental anomalies of lungs</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>LA76</b> | <b>Structural developmental anomalies of pleura</b><br>Anomalies of the lining of the lung (visceral pleura) and thoracic cavity (parietal pleura)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**LA77****Congenital cyst of mediastinum**

A condition caused by failure of the anterior intestine or coelomic cavity to correctly develop during the antenatal period. This condition may be asymptomatic or may present with adjacent organ compression. Confirmation is observation of the cysts by imaging.

**LA7Y****Other specified structural developmental anomalies of the respiratory system****LA7Z****Structural developmental anomalies of the respiratory system, unspecified**

Structural developmental anomalies of the circulatory system (LA80-LA9Z)

**Structural developmental anomaly of heart or great vessels (LA80-LA8Z)**

A congenital malformation of the heart and/or great vessels or an acquired abnormality unique to the congenitally malformed heart.

**Coded Elsewhere:** Congenital great vessel related acquired abnormality (BD52.6)

Congenital cardiac tumor, not otherwise specified (2F9Y)

**LA80****Anomalous position-orientation of heart**

A congenital cardiovascular finding or malformation in which there is an abnormality of the position or orientation of heart.

**LA80.0****Laevocardia**

A congenital cardiovascular finding in which the heart is predominantly to the left of the thoracic midline.

**Coding Note:**

This term should be coded only in the context of complex heart disease. This is independent of the orientation of the cardiac apex.

**LA80.1****Dextrocardia**

A congenital cardiovascular malformation in which the heart is predominantly to the right of the thoracic midline. This is independent of the orientation of the cardiac apex.

**Exclusions:**

Isomerism of left atrial appendages (LA80-LA8Z)

Isomerism of right atrial appendages (LA80-LA8Z)

Total mirror imagery (LA82)

**LA80.2****Mesocardia**

A congenital cardiovascular malformation in which the heart is central or midline within the thorax.

**LA80.3****Extrathoracic heart**

A congenital cardiovascular malformation in which the heart is at least partially outside of the thorax.

**LA88.41****Perimembranous central ventricular septal defect**

A congenital cardiovascular malformation in which there is a ventricular septal defect that 1) occupies the space that is usually closed by the interventricular part of the membranous septum, 2) is usually adjacent to the area of fibrous continuity between the leaflets of an atrioventricular valve and an arterial valve, 3) is adjacent to an area of mitral-tricuspid fibrous continuity, and 4) is located at the center of the base of the ventricular mass.

Additional information: This code is used by some as synonymous with the perimembranous, conoventricular, Type II, or the paramembranous defects. Although best used to describe the perimembranous defect that opens centrally at the base of the right ventricle, this term might be used to code perimembranous defects with inlet or outlet extension. It is recommended, however, that the more precise terms be used whenever possible for coding the latter lesions. It should also not be used to code an inlet ventricular septal defect, or the so-called atrioventricular canal ventricular septal defect. More specific terms exist for coding these entities. It is used by some to describe an isolated perimembranous ventricular septal defect without extension, although it is unlikely that perimembranous defects exist in the absence of deficiency of their muscular perimeter. The conoventricular ventricular septal defect with malalignment should be coded as an outlet defect, as should the perimembranous defect opening to the outlet of the right ventricle. Such defects can also extend to become doubly committed and juxta-arterial (conal septal hypoplasia) when there is also fibrous continuity between the leaflets of the arterial valves or when there is a common arterial valve. Specific codes exist for these variants, which ideally should not be coded using this term.

***Coding Note:***

Although best used to describe the perimembranous defect that opens centrally at the base of the right ventricle, this term might be used to code perimembranous defects with inlet or outlet extension. It is recommended, however, that the more precise terms be used whenever possible for coding the latter lesions. This code is used by some as synonymous with the perimembranous, conoventricular, Type II, or the paramembranous defects. It should not be used to code an inlet VSD, or the so-called atrioventricular canal VSD. More specific terms exist for coding these entities. It is used by some to describe an isolated perimembranous VSD without extension, although it is unlikely that perimembranous defects exist in the absence of deficiency of their muscular perimeter. The conoventricular VSD with malalignment should be coded as an outlet defect, as should the perimembranous defect opening to the outlet of the right ventricle. All perimembranous defects, nonetheless, have part of their margins made up of fibrous continuity either between the leaflets of an atrioventricular and an arterial valve or, in the setting of double outlet right ventricle or overriding of the tricuspid valve, by fibrous continuity between the leaflets of the mitral and tricuspid valves. Such defects can also extend to become doubly committed and juxta-arterial (conal septal hypoplasia) when there is also fibrous continuity between the leaflets of the arterial valves or when there is a common arterial valve. Specific codes exist for these variants, which ideally should not be coded using this term.

| <b>LA89</b>    | <p><b>Functionally univentricular heart</b></p> <p>The term “functionally univentricular heart” describes a spectrum of congenital cardiovascular malformations in which the ventricular mass may not readily lend itself to partitioning that commits one ventricular pump to the systemic circulation, and another to the pulmonary circulation.</p> <p>Additional information: a heart may be functionally univentricular because of its anatomy or because of the lack of feasibility or lack of advisability of surgically partitioning the ventricular mass. Common lesions in this category typically include double inlet right ventricle (DIRV), double inlet left ventricle (DILV), tricuspid atresia, mitral atresia, and hypoplastic left heart syndrome. Other lesions which sometimes may be considered to be a functionally univentricular heart include complex forms of atrioventricular septal defect, double outlet right ventricle, congenitally corrected transposition, pulmonary atresia with intact ventricular septum, and other cardiovascular malformations. Specific diagnostic codes should be used whenever possible, and not the term “functionally univentricular heart”.</p> |
| <b>LA89.0</b>  | <p><b>Double inlet atrioventricular connection</b></p> <p>A congenital cardiovascular malformation with a univentricular atrioventricular connection wherein both atria connect to one ventricle either via two separate atrioventricular valves or a common atrioventricular valve, such that all or nearly all of the total atrioventricular junctional (annular) area is committed to one ventricular chamber.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>LA8A.3</b>       | <p><b>Congenital supravalvar aortic stenosis</b></p> <p>A congenital cardiovascular malformation with narrowing of the aorta at the level of the sinotubular junction which may extend into the ascending aorta.</p> <p>Additional information: 'Congenital supravalvar aortic stenosis' is described as three forms: an hourglass deformity, a fibrous membrane, and a diffuse narrowing of the ascending aorta. Supravalvar aortic stenosis may involve the coronary artery ostia, and the aortic leaflets may be tethered. The coronary arteries can become tortuous and dilated due to elevated pressures and early atherosclerosis may ensue.</p> <p><b>Exclusions:</b> Congenital aortic valvar stenosis (LA8A.20)</p>                                                                                                                                            |
| <b>LA8A.4</b>       | <p><b>Aneurysm of aortic sinus of Valsalva</b></p> <p>A congenital cardiovascular malformation in which there is dilation of one or more sinuses of Valsalva.</p> <p>Additional information: the sinus of Valsalva is defined as that portion of the aortic root between the aortic root annulus and the sinotubular junction. Sinus of Valsalva aneurysm most commonly originates from the right sinus, less commonly from the non-coronary sinus and rarely from the left sinus (&lt;5%). The aneurysm may rupture into an adjacent chamber or site (right atrium, right ventricle, left atrium, left ventricle, pulmonary artery, pericardium) and in this case should be coded specifically ('Ruptured aortic sinus of Valsalva aneurysm'). This is to be distinguished from aortic root dilation associated with connective tissue disorders and aortopathies.</p> |

**LA8A.5****Congenital subaortic stenosis**

#DRAFT# A congenital cardiovascular malformation associated with narrowing within the outflow tract supporting the aortic valve. Subaortic obstruction can be caused by different lesions: subaortic membrane or tunnel, accessory mitral valve tissue, abnormal insertion of the mitral anterior leaflet to the ventricular septum, deviation of the outlet septum (seen in coarctation of the aorta and interrupted aortic arch), or a restrictive ventricular septal defect (bulboventricular foramen) in single ventricle complexes. Subvalvar aortic stenosis may be categorized into two types: localised subvalvar aortic stenosis, which consists of a fibrous or fibromuscular ridge, and diffuse tunnel subvalvar aortic stenosis, in which circumferential narrowing commences at the annular level and extends downward for 1-3 cm.

**Exclusions:** Subaortic stenosis due to fibromuscular tunnel (LA8A)  
Subaortic stenosis due to fibromuscular shelf (LA8A)

**LA8A.6****Congenital subpulmonary stenosis**

A congenital cardiovascular malformation associated with narrowing within the outflow tract supporting the pulmonary valve.

Additional information: subvalvar (infundibular) pulmonary stenosis is a narrowing of the outflow tract of the ventricle immediately below the pulmonic valve. This term should preferably be used in the setting of abnormal ventriculo-arterial connections, such as double outlet ventricle. Although subvalvar pulmonary stenosis is a type of right ventricular outflow tract obstruction if the ventriculo-arterial connections are normal, in this setting 'Congenital right ventricular outflow tract obstruction' should be used. Subvalvar pulmonary stenosis is also a type of left ventricular outflow tract obstruction in the setting of discordant ventriculo-arterial connections; this term should be used when the obstruction is only apparent immediately below the pulmonary valve, otherwise the term 'Congenital left ventricular outflow tract obstruction' should be used

**Exclusions:** Double chambered right ventricle (LA88.1)

**LA8A.Y****Other specified congenital anomaly of a ventriculo-arterial valve or adjacent regions****LA8A.Z****Congenital anomaly of a ventriculo-arterial valve or adjacent regions, unspecified****LA8B****Congenital anomaly of great arteries including arterial duct**

A congenital cardiovascular malformation of the great arteries (aorta, pulmonary trunk [main pulmonary artery], branch pulmonary arteries) or the arterial duct (ductus arteriosus).

**Exclusions:** Common arterial trunk (LA85.4)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Structural developmental anomalies of the diaphragm, abdominal wall or umbilical cord (LB00-LB0Z)

Any condition caused by failure of the diaphragm, abdominal wall or umbilical cord to correctly develop during the antenatal period.

**Exclusions:** Prune belly syndrome (LD2F.10)

**LB00** **Structural developmental anomalies of diaphragm**

**LB00.0** **Congenital diaphragmatic hernia**

Congenital diaphragmatic hernia is a posterolateral defect of the diaphragm that allows passage of abdominal viscera into the thorax, leading to respiratory insufficiency and persistent pulmonary hypertension with high mortality.

**Exclusions:** Congenital hiatus hernia (LB13.1)

**LB00.1** **Absence of diaphragm**

**LB00.Y** **Other specified structural developmental anomalies of diaphragm**

**LB00.Z** **Structural developmental anomalies of diaphragm, unspecified**

**LB01** **Omphalocele**

Omphalocele is an embryopathy classified in the group of abdominal celosomias and is characterised by a large hernia of the abdominal wall, centred on the umbilical cord, in which the protruding viscera are protected by a sac.

**Exclusions:** Umbilical hernia (DD53)

**LB02****Gastroschisis**

Gastroschisis is a congenital abdominal wall defect characterised by viscera protruding, without a covering sac, from the fetal abdomen on the right lateral base of the umbilicus.

**LB03****Structural developmental anomalies of umbilical cord**

Any condition caused by failure of the umbilical cord to correctly develop during the antenatal period.

**Coded Elsewhere:** Umbilical cord haemangioma (2E81.00)

Fetus or newborn affected by short umbilical cord (KA03.20)

Fetus or newborn affected by long umbilical cord (KA03.21)

Developmental anomalies of the umbilicus (EC50)

**LB03.0****Allantoic duct remnants or cysts**

Any condition caused by failure of the umbilical cord to correctly develop during the antenatal period. These conditions are characterised by cysts or remnants of allantoic tissue within the umbilical cord, the umbilicus, or the urachus.

**LB03.1****Single umbilical cord artery**

A single umbilical artery arising from either the allantoic arterial system (Type I) or vitelline artery (Type II). It has been associated with renal anomalies.

**LB03.Y****Other specified structural developmental anomalies of umbilical cord****LB03.Z****Structural developmental anomalies of umbilical cord, unspecified****LB0Y****Other specified structural developmental anomalies of the diaphragm, abdominal wall or umbilical cord****LB0Z****Structural developmental anomalies of the diaphragm, abdominal wall or umbilical cord, unspecified**

Structural developmental anomalies of the digestive tract (LB10-LB1Z)

Any condition caused by failure of the digestive tract to correctly develop during the antenatal period.

**Coded Elsewhere:** Genetic or developmental disorders involving lips or oral mucosa (DA02.0)

**LB10****Structural developmental anomalies of salivary glands or ducts**

Any condition caused by failure of the salivary glands and ducts to correctly develop during the antenatal period.

**LB11****Congenital diverticulum of pharynx**

A condition caused by failure of the pharynx to correctly develop during the antenatal period. This condition may present with difficulty swallowing, or may be asymptomatic. Confirmation is through observation of a diverted pharynx by imaging.

**Exclusions:** pharyngeal pouch syndrome (LD44.N0)

**LB12****Structural developmental anomalies of oesophagus**

Any congenital defect of oesophagus that results from interference with the normal growth and differentiation of the fetus. Such defects can arise at any stage of embryonic development, vary greatly in type and severity, and are caused by a wide variety of determining factors, including genetic mutations, chromosomal aberrations, teratogenic agents, and environmental factors. Most developmental defects are apparent at birth, especially any structural malformation, but some become evident later.

**Coded Elsewhere:** Bronchopulmonary foregut malformation (LA74.Y)

**LB12.0****Congenital oesophageal web or ring**

A rare form of incomplete oesophageal obstruction due to a developmental defect of the primitive foregut that presents as a mucosal lesion forming an incomplete diaphragm. Symptoms (apparent from birth) include dysphagia, regurgitation, and choking.

**Exclusions:** Oesophageal web (DA20.2)

**LB12.1****Atresia of oesophagus**

Oesophageal atresia encompasses a group of congenital anomalies with an interruption in the continuity of the oesophagus, with or without persistent communication with the trachea. In 86% of cases there is a distal tracheoesophageal fistula, in 7% of cases there is no fistulous connection, while in 4% of cases there is a tracheoesophageal fistula without atresia. The remaining cases are made up of patients with OA with proximal, or both proximal and distal, tracheoesophageal fistula.

**Coded Elsewhere:** Laryngotracheoesophageal cleft (LA72)

**LB12.10**

Atresia of oesophagus with oesophagobronchial fistula

**LB12.1Y**

Other specified atresia of oesophagus

**LB12.1Z**

Atresia of oesophagus, unspecified

**LB12.2****Oesophageal fistula without atresia**

This is a birth defect (congenital anomaly) of oesophagus, and one type of EA/TEF, namely isolated "H"-shaped atresia. Tracheoesophageal fistula in which there is no oesophageal atresia because the oesophagus is continuous to the stomach. Fistula is present between the oesophagus and the trachea. Incidence of TE fistula without atresia varies between 1-11% of oesophageal malformations.

**LB12.3****Congenital stenosis or stricture of oesophagus**

A form of incomplete oesophageal obstruction due to a developmental defect of the primitive foregut. Abnormal narrowing of the oesophagus occurs most often at the junction of the middle and lower thirds. Clinical manifestations, apparent 2 to 3 weeks after birth, include dysphagia and progressive vomiting.

**LB13.Y**                      **Other specified structural developmental anomalies of stomach**

**LB13.Z**                      **Structural developmental anomalies of stomach, unspecified**

**LB14**                        **Structural developmental anomalies of duodenum**

Any congenital defect of duodenum that results from interference with the normal growth and differentiation of the fetus. Such defects can arise at any stage of embryonic development, vary greatly in type and severity, and are caused by a wide variety of determining factors, including genetic mutations, chromosomal aberrations, teratogenic agents, and environmental factors. Most developmental defects are apparent at birth, especially any structural malformation, but some become evident later.

**LB15**                        **Structural developmental anomalies of small intestine**

Congenital gross anatomical structural defect of small intestine that results from interference with the normal growth and differentiation of the fetus, which may be inherited genetically, acquired during gestation, or inflicted during parturition.

**LB15.0**                      **Meckel diverticulum**

A congenital abnormality characterised by the outpouching or sac formation in the ileum. It is a remnant of the embryonic yolk sac in which the vitelline duct failed to close. During early gestation, the omphalomesenteric or vitelline duct connects the fetal yolk sac to the primitive gut. By 7-8 weeks of gestation, this duct is normally completely obliterated. A Meckel diverticulum results when this structure fails to resorb completely.

**LB15.1**                      **Atresia of small intestine**

Jejunioileal atresias and stenoses are major causes of neonatal intestinal obstruction. Atresia refers to a congenital obstruction with complete occlusion of the intestinal lumen. It accounts for 95% of obstructions. Four types of jejunioileal atresias are described. They can range from having a small area of blockage or web to missing large sections of the intestines.

Intestinal atresia is one of the most frequent causes of bowel obstruction in the newborn. The ileal atresia is more common than jejunal atresia, and multiple foci are more common than isolated atresia. The most accepted theory regarding the etiology of jejunioileal atresia is that of an intrauterine vascular accident resulting in necrosis of the affected segment.

Stenosis, on the other hand, refers to a partial occlusion with incomplete obstruction and accounts for the remaining 5% of cases. A stenosis has an intact mesentery and is a localised narrowing of the bowel. No loss of continuity of the lumen exists.

**Inclusions:**                      Congenital absence of small intestine  
                                            Congenital stenosis of small intestine

**LB15.2**                      **Congenital short bowel**

Short bowel syndrome is a condition in which nutrients are not properly absorbed due to a congenital defect where a large part of the small intestine is missing.

| <b>LB17.0</b> | <p><b>Anorectal malformations</b></p> <p>Anorectal malformations (ARMs) are birth defects (due to alterations in embryo development of hindgut or proctodeum) where the anus and rectum (the lower end of the digestive tract) do not develop properly. They occur in approximately 1 in 5000 live births. These comprise a wide spectrum of diseases, which can affect boys and girls, and involve the distal anus and rectum as well as the urinary and genital tracts. Several abnormalities can occur, including the following: A membrane may be present over the anal opening; The rectum may not connect to the anus (imperforate anus); The rectum may connect to a part of the urinary tract or the reproductive system through an abnormal passage called a fistula. The classification of ARMs is mainly based on the position of the rectal pouch relative to the puborectal sling, the presence or absence of fistulas, and the types and locations of the fistulas. The following classification is according to the level of the atretic rectal cul-de-sac with respect to the pubococcygeal line (the radiological landmark for the upper border or the levator ani muscle).</p> |
| <b>LB17.1</b> | <p><b>Ectopic anus</b></p> <p>While children with imperforate or obviously mislocated anus are identified in the newborn period, some children with a very mild abnormality may escape identification until after the newborn period. This mild mislocation of the anus has been termed anterior ectopic anus. Anterior ectopic anus is different from imperforate anus with perineal fistula in that the anal opening is usually of normal size, and only mildly misplaced. Most of these children come to medical attention due to severe constipation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>LB17.2</b> | <p><b>Persistent cloaca</b></p> <p>A congenital anomaly in which the intestinal, urinary, and reproductive ducts open into a common cavity, a result of the failure of the urorectal septum to form during prenatal development. They occur exclusively in girls and comprise the most complex defect in the spectrum of anorectal malformations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>LB17.3</b> | <b>Cloacal exstrophy</b><br>Rare and complex anorectal and genitourinary malformation in which rectum, vagina and urinary tract share a common everted orifice, accompanied by an omphalocele and an imperforate anus.<br><br>Exstrophy of the cloaca is a well-known malformation that includes the persistence and the exstrophy of a cloaca that receives ureters, ileum and a rudimentary hindgut. Cloacal exstrophy is a severe birth defect wherein much of the abdominal organs (the bladder and intestines) are exposed. It often causes the splitting of both male and female genitalia (specifically, the penis and clitoris respectively), and the anus is occasionally sealed. |
| <b>LB17.4</b> | <b>Perineal groove</b><br>The perineal groove describes a normal vestibule but with a groove extending from the vestibule to the anus, which is both normal sized and positioned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>LB20.21</b> | Biliary atresia<br>Biliary atresia is a rare disease characterised by an inflammatory biliary obstruction of unknown origin that presents in the neonatal period. It is the most frequent surgical cause of cholestatic jaundice in this age group. Untreated, this condition leads to cirrhosis and death within the first years of life.                                                                                                                                                                                                                                                                                                               |

| <b>LB21.0</b>  | <b>Annular pancreas</b><br>Annular pancreas is a distinct form of duodenal atresia in which the head of the pancreas forms a ring around the second portion of the duodenum. During the neonatal period, the clinical picture is dominated by epigastric distension with vomiting, which is nonbilious as the obstruction is usually supra-vaterian. Chromosomal abnormalities are present in one-third of cases of annular pancreas, with trisomy 21 (followed by trisomy 18 and 13) being the most frequently detected anomaly. Annular pancreas is an embryopathy resulting from an anomaly occurring early (towards the fourth week) in development. |
| <b>LB21.1</b>  | <b>Pancreas divisum</b><br>This is a congenital anomaly in the anatomy of the ducts of the pancreas in which a single pancreatic duct is not formed, but rather remains as two distinct dorsal and ventral ducts.                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|               |                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LB21.2</b> | <b>Accessory pancreas</b>                                                                                 | Accessory pancreas is an asymptomatic embryopathy characterised by the presence of pancreatic tissue in other sites of the body such as the splenic pedicle, gonadic pedicles, intestinal mesentery, duodenum wall, upper jejunum, or, more rarely, the gastric wall, ileum, gallbladder or spleen.                                                                                                                                          |
| <b>LB21.3</b> | <b>Agenesis-aplasia of pancreas</b>                                                                       | This refers to the failure of an organ to develop during embryonic growth and development due to the absence of primordial tissue of the pancreas.                                                                                                                                                                                                                                                                                           |
| <b>LB21.4</b> | <b>Partial agenesis of pancreas</b>                                                                       | Partial agenesis of the pancreas is characterised by the congenital absence of a critical mass of pancreatic tissue. The severity of the disease depends on the amount of functional pancreatic tissue present. Pancreatic agenesis is commonly associated with other malformations, in particular pancreaticobiliary duct anomalies, leading to acute or chronic pancreatitis, hyperglycaemia (50% of cases), or, more rarely, polysplenia. |
| <b>LB21.5</b> | <b>Hypoplasia of pancreas</b>                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Structural developmental anomalies of the urinary system (LB30-LB3Z)

Any condition caused by failure of the urinary system to correctly develop during the antenatal period.

|                |                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>LB30.61</b> | <p>Fused pelvic kidney</p> <p>A condition caused by failure of the kidneys to correctly develop during the antenatal period. This condition is characterised by the presence of a single kidney, along the midline of the body. This condition may present with kidney stones, hydronephrosis, kidney infection, haematuria, or may be asymptomatic. Confirmation is through observation of a fused kidney by imaging.</p>                                                                                                                                                                                                                                                                                                                                   |
| <b>LB30.62</b> | <p>Horseshoe kidney</p> <p>Horseshoe kidney is the most frequent renal fusion anomaly and is characterised by the union of the inferior poles of the two kidneys through an isthmus. Horseshoe kidney is in fact an anatomical anomaly rather than a disease, but it does lead to predisposition to certain conditions such as hydronephrosis, nephrolithiasis or pyelonephritis. One third of individuals with horseshoe kidney are asymptomatic, with the anomaly being discovered fortuitously during a radiological examination. Urogenital or renal vessel anomalies may be associated with the condition. For cases requiring treatment, various therapeutic approaches are available and choice of treatment depends on the associated pathology.</p> |

- LB31.0 Congenital hydronephrosis**  
 Congenital hydronephrosis is a renal urinary disease characterised by distension and dilation of the renal pelvis and calyces secondary to various congenital obstructive malformations of the kidneys and urinary tract that can evolve to renal atrophy.
- LB31.1 Congenital primary megaureter**  
 Congenital primary megaureter is an idiopathic condition in which the bladder and bladder outlet are normal but the ureter is dilated to some extent. It may be obstructed, refluxing or unobstructed and not refluxing.
- LB31.2 Fetal lower urinary tract obstruction**  
 A disease caused by partial or complete obstruction of the urethra, during the antenatal period. This disease can present with enlarged bladder, oligohydramnios, or pulmonary hypoplasia. Confirmation is through observation of the obstruction by imaging.
- LB31.3 Exstrophy of urinary bladder**  
 Bladder exstrophy (or classic bladder exstrophy) is a congenital genitourinary malformation belonging to the spectrum of the exstrophy-epispadias complex and is characterised by an evaginated bladder plate, epispadias and an anterior defect of the pelvis, pelvic floor and abdominal wall.
- Inclusions:**                      Ectopia vesicae  
                                                  Extroversion of bladder
- LB31.4 Congenital diverticulum of urinary bladder**  
 A condition caused by failure of the bladder to correctly develop. This condition is characterised by weakness in the bladder wall through which some of the lining of the bladder protrudes. This condition may present with urinary tract infections, difficulty voiding, or abdominal fullness. This condition may also be asymptomatic.
- LB31.5 Duplication of urethra**  
 A condition caused by failure of the urethra to correctly develop during the antenatal period. This condition is characterised by the presence of a second passage from the bladder. This condition may present with double urinary stream, urination from the anus, or may be asymptomatic. Confirmation is through observation of a second urethra by imaging.
- LB31.6 Congenital megalourethra**  
 A condition caused by failure of the penile corpora cavernosa and spongiosa to correctly develop during the antenatal period. This condition is characterised by dilatation of the penile urethra. This condition may present with poor stream, swelling of the penis, megacystis, oligohydramnios, renal failure, or pulmonary hypoplasia.
- LB31.7 Megacystis-megaureter**  
 Megacystic-megaureter syndrome describes the presence of a massive primary non-obstructive vesicoureteral reflux and a large capacity, smooth, thin walled bladder due to the continual recycling of refluxed urine. Recurrent urinary infections are commonly associated with this condition.

Structural developmental anomalies of the female genital system (LB40-LB4Z)

**Exclusions:** Disorders of sex development leading to sexual ambiguity (LD2A)

**LB40 Structural developmental anomalies of vulva**

A deformation established before birth of an anatomical structure of the vulva.

**LB40.0 Absence of vulva**

This is a birth defect or congenital abnormality of the female genitourinary system that manifests itself in the absence of the vulva.

**LB40.1 Embryonic cyst of vulva**

Remnant tissue from embryological development of the pelvic organs presenting as a closed fluid sac in or on the tissue of the vulva.

**LB40.2 Fusion of labia**

A condition of the labia commonly affecting females between 6 months and 6 years of age, caused by skin irritation during infancy. This condition is characterised by the sealing of the labia minor (usually completely) due to a thin membrane that seals the entrance to the vagina, leaving a very small gap for urination.

**LB40.Y Other specified structural developmental anomalies of vulva**

**LB40.Z Structural developmental anomalies of vulva, unspecified**

**LB41 Structural developmental anomalies of clitoris**

A deformation established before birth of an anatomical structure of the clitoris.

**LB41.0 Agenesis of clitoris**

**LB41.1 Duplication of clitoris**

An anatomical anomaly present at birth in which there are two clitoral structures present.

**LB41.2 Clitoromegaly**

**LB41.Y Other specified structural developmental anomalies of clitoris**

**LB41.Z Structural developmental anomalies of clitoris, unspecified**

**LB42 Structural developmental anomalies of vagina**

A deformation established before birth of an anatomical structure of the vagina.

**LB42.0 Absence of vagina**

A condition of the genitourinary system affecting females, caused by an abnormality arising during the antenatal period. This condition is characterised by vaginal agenesis.

|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LB42.1</b> | <p><b>Septate vagina</b></p> <p>A condition of the genitourinary system affecting females, caused by the absence of Mullerian duct fusion during the antenatal period. This condition is characterised by a transverse or longitudinal septum, partitioning the vagina into two parts. This condition may also present with dyspareunia, abnormal vaginal bleeding, or is asymptomatic. Confirmation is by imaging.</p> <p><b>Exclusions:</b> doubling of vagina with doubling of uterus and cervix (LB44.3)</p> |
| <b>LB42.2</b> | <p><b>Congenital rectovaginal fistula</b></p> <p>A condition of the genitourinary system affecting females, caused by an abnormality arising during the antenatal period. This condition is characterised by the formation of an abnormal passage between the rectum and the vagina.</p> <p><b>Exclusions:</b> Persistent cloaca (LB17.2)</p>                                                                                                                                                                    |
| <b>LB42.3</b> | <p><b>Tight hymenal ring</b></p> <p>A condition of the vagina, caused by determinants arising during the antenatal period. This condition is characterised by tightening of the hymen and stenosis of the external opening of the vagina, and dyspareunia.</p> <p><b>Inclusions:</b> Rigid hymen<br/>Tight introitus</p> <p><b>Exclusions:</b> Imperforate hymen (LB42.4)</p>                                                                                                                                    |
| <b>LB42.4</b> | <p><b>Imperforate hymen</b></p> <p>A condition in which the hymen, the membrane that surrounds or partially covers the external vaginal opening, is harder than normal or is complete and sealed without any opening into the vaginal vault.</p>                                                                                                                                                                                                                                                                 |
| <b>LB42.5</b> | <p><b>Stricture or atresia of vagina</b></p> <p>A condition of the vagina, caused by an abnormality arising during the antenatal period. This condition is characterised by stenosis and occlusion of the vaginal opening.</p> <p><b>Exclusions:</b> Postoperative adhesions of vagina (GC70)</p>                                                                                                                                                                                                                |
| <b>LB42.Y</b> | <b>Other specified structural developmental anomalies of vagina</b>                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>LB44.2</b> | <b>Unicornuate uterus</b><br>A uterine malformation where the uterus is formed from one only of the paired Müllerian ducts while the other Müllerian duct does not develop or develops only in a rudimentary fashion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>LB44.3</b> | <b>Bicornuate uterus</b><br>A condition of the uterus, caused by malformation in the development of the uterus during the antenatal period. This condition is characterised by a uterus with a bifurcated cephalo, and a unitary caudal part. Confirmation is by imaging.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>LB44.4</b> | <b>Septate uterus</b><br>Longitudinal septum in uterus, subclassified as complete or partial                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>LB44.5</b> | <b>Congenital fistulae between uterus and digestive and urinary tracts</b><br>A condition caused by abnormal tissue development during the antenatal period. This condition is characterised by the formation of an abnormal passage between the uterus, digestive, and urinary tracts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>LB44.6</b> | <b>Uterovaginal malformation due to diethylstilbestrol syndrome</b><br>Fetal diethylstilbestrol syndrome is characterised by a group of symptoms likely to occur in children and grandchildren of a woman who was treated while pregnant with diethylstilbestrol (DES). The drug is a synthetic nonsteroidal oestrogen, used in the US until 1971 and in Europe until 1978 to try and prevent miscarriage, premature delivery, and other pregnancy complications. It has been estimated that 25% of female fetuses exposed to DES in utero during the first trimester have subsequently developed genital tract anomalies including vaginal adenosis, cervical malformations, vaginal septae, uterine cavity anomalies, or fallopian tube anomalies causing subsequent fertility problems. |
| <b>LB44.Y</b> | <b>Other specified structural developmental anomalies of uterus, except cervix</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

- LB45.0 Congenital absence of ovary**  
A condition of the ovary, caused by determinants arising during the antenatal period. This condition is characterised by a female born with fewer than two ovaries.  
**Exclusions:** Turner syndrome (LD50.0)
- LB45.1 46,XX gonadal dysgenesis**  
Karyotype 46 XX; Gonads: gonadal dysgenesis (streak gonads); Phenotype female with symptoms like primary amenorrhea, hypergonadotropic hypogonadism, normal stature and no other abnormalities.
- LB45.2 Developmental ovarian cyst**  
A condition in which an individual is born with a benign, functional cyst, or cysts, on one or more ovaries which result from enlargement of otherwise normal follicles during third trimester or early neonatal period.
- LB45.3 Congenital torsion of ovary**  
A condition of the ovary, caused by determinants arising during the antenatal period. This condition is characterised by a partial or complete rotation of the ovary, an occlusion to the venous or arterial blood supply of the ovary, severe lower abdominal pain that may radiate to the back, pelvis and thigh, and nausea, vomiting, diarrhoea or constipation.
- LB45.4 Accessory ovary**  
A condition of the ovary, caused by determinants arising during the antenatal period. This condition is characterised by excess ovarian tissue situated near an anatomically correct ovary, which may or may not be connected to the original ovarian tissue.
- LB45.5 Congenital absence of fallopian tube**  
A condition of the fallopian tube, caused by determinants arising during the antenatal period. This condition is characterised by a female born with fewer than two fallopian tubes.
- LB45.6 Atresia of fallopian tube**  
A condition of the fallopian tube, caused by determinants arising during the antenatal period. This condition is characterised by unilateral or bilateral closure or absence of the fallopian tube(s), commonly within the proximal isthmic or proximal ampullary segments.
- LB45.7 Accessory fallopian tube**  
A condition of the fallopian tube, caused by determinants arising during the antenatal period. This condition is characterised by the duplication of one or more fallopian tubes, commonly attached to the ampullary segment.

Structural developmental anomalies of the male genital system (LB50-LB5Z)

Any condition affecting the male genital system, caused by determinants arising during the antenatal period. These conditions are characterised by structural developmental anomalies.

**Exclusions:** Disorders of sex development leading to sexual ambiguity (LD2A)

**LB50** **Micropenis or penis agenesis**  
A condition caused by reduced androgen production during the antenatal period. This condition is characterised by an absent, or unusually small penis. Confirmation is by measuring the length of a dorsal erectile penis.

**LB51** **Anorchia or microorchidia**  
A disorder affecting males, caused by an abnormality occurring in sex development during the antenatal period. This disorder is characterised by individuals who are born with absence of the testes, or with testes that are deficient in size and function. Confirmation is by physical examination, identification of low testosterone levels but elevated follicle stimulating hormone and luteinizing hormone levels in a blood sample, or imaging.

**Coded Elsewhere:** Testicular agenesis (LD2A.2)

**LB52****Cryptorchidism**

A disorder affecting males, caused by an abnormality occurring in sex development during the antenatal period. This disorder is characterised by the absence of one or both testes from the scrotum. This disorder may also present with reduced fertility, psychological implications, or increased risk of testicular germ cell tumours. Confirmation is by imaging, karyotyping, or identification of male sex hormones in a blood sample.

**Exclusions:** Retractable testis migrans (MF42)

**LB52.0****Ectopic testis**

A condition of the testis, caused by determinants arising during the antenatal period. This condition is characterised by the abnormal location of the testis away from the normal line of descent such as in the superficial inguinal pouch, perineal, abdominal, pelvic, crural, penile or femoral positions, and with normal testis and spermatic cord anatomy. Confirmation is by diagnostic laparoscopy to rule out an intra-abdominal, inguinal or absent/vanishing testis.

**LB52.1****Undescended testicle, unilateral**

The situation in which one of the two testicles in a male has not transitioned from the abdomen, and therefore appears absent from the scrotum.

**LB52.2****Undescended testicle, bilateral**

The situation in which both testicles in a male have not transitioned from the abdomen, and therefore appear absent from the scrotum.

**LB52.Y****Other specified cryptorchidism****LB52.Z****Cryptorchidism, unspecified****LB53****Hypospadias**

Any condition of the urethra affecting males, caused by determinants arising during the antenatal period. These conditions are characterised by a malformation of the urethra and an abnormally placed urinary meatus.

**Exclusions:** Epispadias (LB55)

**LB53.0****Hypospadias, balanic**

A condition of the urethra affecting males, caused by determinants arising during the antenatal period. This condition is characterised by a malformation of the urethra and an abnormally placed urinary meatus that opens at the site of the frenulum. This condition may also present with an incomplete foreskin that forms a hood.

**LB53.00****Hypospadias, coronal**

A condition of the urethra affecting males, caused by determinants arising during the antenatal period. This condition is characterised by a malformation of the urethra and the ventral side of the penis, leading to an abnormally placed urinary meatus that opens in the ventral portion of the coronal sulcus. This condition may also present with an incomplete foreskin that forms a hood.

| <b>LB54</b>    | <p><b>Congenital chordee</b></p> <p>A condition caused by the development of fibrous bands of tissue along the corpus spongiosum and shortening of the ventral skin during the antenatal period. This condition is characterised by ventral or dorsal curvature of the head of the penis at the junction with the shaft, most apparent during erection. This condition may also present with hypospadias.</p>                                      |

**LB55****Epispadias**

Epispadias is a congenital genitourinary malformation belonging to the spectrum of the exstrophy-epispadias complex and is characterised in males by an ectopic meatus or a mucosal strip in place of the urethra on the penile dorsum and in females by bifid clitoris and a variable cleft of the urethra.

**Exclusions:** Hypospadias (LB53)

**LB56****Bifid scrotum**

A condition caused by failure of the scrotum to correctly develop during the antenatal period resulting in incomplete fusion of the labioscrotal folds. This condition is characterised by a deep midline cleft in the scrotum. This condition may be asymptomatic.

**LB57****Agenesis of vas deferens**

A condition of the vas deferens affecting males, caused by determinants arising during the antenatal period. This condition is characterised by the unilateral or bilateral absence of the vas deferens, azoospermia, and infertility.

**LB58****Polyorchidism**

A condition of the testes, caused by determinants arising during the antenatal period. This condition is characterised by the presence of more than two testicles. Confirmation is by imaging.

**LB59****Hypoplasia of testis or scrotum**

A condition caused by incomplete development of the testis and scrotum during the antenatal period. This condition is characterised by a decrease or destruction in the number or size of cells testis and scrotal tissue.

**LB5Y****Other specified structural developmental anomalies of the male genital system****LB5Z****Structural developmental anomalies of the male genital system, unspecified**

Structural developmental anomalies of the breast (LB60-LB6Z)

A deformation established before birth of an anatomical structure of the breast or breast tissue.

**LB60****Breast aplasia**

A condition caused by failure of the breast to develop during the antenatal period. This condition is characterised by a total lack of breast tissue. This condition may also present with absence of the nipple or pectoral muscle.

**LB61****Absent nipple**

A condition caused by failure of the nipple to develop during the antenatal period. This condition is characterised by a total lack of a nipple. This condition may also present with absence of the breast or pectoral muscle.

**LB62****Supernumerary breasts**

A condition caused by failure of the breasts to correctly develop during the antenatal period. This condition is characterised by supernumerary breasts, with or without nipples. This condition may be asymptomatic.

**LB63****Accessory nipple**

A condition caused by development of supernumerary nipples during the antenatal period. This condition is characterised by the presence of nipples or nipple-like structures additional to the normal two. This condition may be asymptomatic.

**Inclusions:** Supernumerary nipple

**LB6Y****Other specified structural developmental anomalies of the breast****LB6Z****Structural developmental anomalies of the breast, unspecified**

Structural developmental anomalies of the skeleton (LB70-LB9Z)

A deformation established before birth of an anatomical structure of one or more bones.

**LB70****Structural developmental anomalies of cranium**

Any condition caused by failure of the cranium to correctly develop during the antenatal period.

**Coded Elsewhere:** Wide cranial sutures of newborn (KD31)

**LB70.0****Craniosynostosis**

Craniosynostosis consists of premature fusion of one or more cranial sutures, resulting in an abnormal head shape. It can be divided in several subgroups; the major different types are primary vs secondary craniosynostosis and isolated vs syndromic craniosynostosis.

**Inclusions:** Imperfect fusion of skull

**LB70.00****Plagiocephaly**

Isolated synostotic plagiocephaly is a form of nonsyndromic craniosynostosis characterised by premature fusion of one coronal or lambdoid suture leading to skull deformity and facial asymmetry.

**LB70.0Y****Other specified craniosynostosis****LB70.0Z****Craniosynostosis, unspecified****LB70.1****Wormian bones**

Also known as intrasutural bone, is an additional bony segment interlocked in an existing cranial suture. A special form: Interparietal bone or Inca bone is an interlocked irregular isolated bone at the lambdoid suture. Although harmless it may be associated with craniofacial and other syndromes.

**LB70.2****J-shaped sella turcica**

| <b>LB76</b>   | <b>Triphalangeal thumb</b><br>A condition caused by failure of the thumb to correctly develop during the antenatal period. This condition is characterised by a long, finger-like thumb with three phalanges instead of two. Isolated triphalangeal thumbs may be associated with genetic abnormality in the 7q36 region.                                                                    |
| <b>LB77</b>   | <b>Hyperphalangy</b><br>Hyperphalangy is a congenital, non-syndromic limb malformation characterized by the presence of an accessory phalanx between metacarpal/metatarsal and proximal phalanx, or between any two other phalanges of a digit, excluding the thumb. Hyperphalangy is almost always bilateral and patients present no more than five digits and no other skeletal anomalies. |
| <b>LB78</b>   | <b>Polydactyly</b><br>Any condition caused by development of supernumerary fingers during the antenatal period.                                                                                                                                                                                                                                                                              |
| <b>LB78.0</b> | <b>Polydactyly of the thumb</b><br>A condition caused by development of supernumerary thumbs during the antenatal period.                                                                                                                                                                                                                                                                    |
| <b>LB78.1</b> | <b>Polysyndactyly</b><br>Polysyndactyly is a form of preaxial polydactyly of fingers characterised by the presence of a thumb showing the mildest degree of duplication, being broad, bifid or with radially deviated distal phalanx. Syndactyly of various degrees of third-and-fourth fingers is occasionally present. Two forms have been characterised: unilateral and bilateral.        |
| <b>LB78.2</b> | <b>Postaxial polydactyly of fingers</b><br>A condition caused by development of supernumerary fingers during the antenatal period. This condition is characterised by fifth digit duplications.                                                                                                                                                                                              |
| <b>LB78.3</b> | <b>Polydactyly of toes</b><br>Any condition caused by development of supernumerary toes during the antenatal period.                                                                                                                                                                                                                                                                         |
| <b>LB78.Y</b> | <b>Other specified polydactyly</b>                                                                                                                                                                                                                                                                                                                                                           |
| <b>LB78.Z</b> | <b>Polydactyly, unspecified</b>                                                                                                                                                                                                                                                                                                                                                              |

**LB79****Syndactyly**

A condition caused by failure of the longitudinal interdigital necrosis that normally separates the digits during the antenatal period. This condition is characterised by the presence of two or more digits that are fused together.

**Coded Elsewhere:** Polysyndactyly (LB78.1)

**LB79.0****Fused fingers**

**Inclusions:** complex syndactyly of fingers with synostosis

**LB79.1****Webbed fingers**

A condition caused by failure of the longitudinal interdigital necrosis that normally separates the fingers to during the antenatal period. This condition is characterised by the presence of two or more fingers that are fused together.

**Inclusions:** Simple syndactyly of fingers without synostosis

**LB79.2****Fused toes**

**Inclusions:** Complex syndactyly of toes with synostosis

**LB79.3****Webbed toes**

A condition caused by failure of the longitudinal interdigital necrosis that normally separates the toes during the antenatal period. This condition is characterised by the presence of two or more toes that are fused together.

**Inclusions:** Simple syndactyly of toes without synostosis

**LB79.Y****Other specified syndactyly****LB79.Z****Syndactyly, unspecified**

## Congenital deformities of fingers or toes (LB80-LB81.Z)

**LB80****Congenital deformities of fingers**

Any condition caused by failure of the fingers to develop correctly during the antenatal period.

**Inclusions:** Congenital deformities of hand

**LB80.0****Clinodactyly of fingers**

A condition caused by failure of the fifth finger to correctly develop during the antenatal period. This condition is characterised by bending of the fifth finger towards the fourth.

**LB80.2****Radial deviation of fingers****LB80.Y****Other specified congenital deformities of fingers****LB80.Z****Congenital deformities of fingers, unspecified****LB81****Congenital deformities of toes**

**Coded Elsewhere:** Congenital hammer toe (LB98.5)

Structural developmental anomalies of the skin (LC00-LC7Z)

A deformation established before birth of an anatomical structure of the skin.

**Exclusions:**

- pilonidal cyst or sinus (EG63)
- Congenital erythropoietic porphyria (5C58.12)
- Acrodermatitis enteropathica (5C64.20)

## Developmental hamartomata of the epidermis and epidermal appendages (LC00-LC0Y)

Keratinocytic, pilosebaceous, eccrine, apocrine and other complex hamartomatous malformations of the skin.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>LC00</b>   | <b>Keratinocytic epidermal hamartoma</b><br>Keratinocytic epidermal hamartoma or epidermal naevus is a congenital hamartomatous epidermal malformation composed of keratinocytes. It is thought to arise as a result of somatic mutation: early embryonic mutations can give rise to extensive systematised naevi, though typically epidermal naevi are localised linear papillomatous or verrucous plaques. Histologically they exhibit acanthosis, papillomatosis and acanthosis.<br><b>Coded Elsewhere:</b> Linear porokeratosis (ED52) |
| <b>LC00.0</b> | <b>Epidermal naevus</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>LC00.Y</b> | <b>Other specified keratinocytic epidermal hamartoma</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>LC00.Z</b> | <b>Keratinocytic epidermal hamartoma, unspecified</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**LC01****Pilosebaceous hamartoma**

Hamartomatous malformation involving elements originating from the developing pilosebaceous follicle.

**LC02****Complex epidermal hamartoma**

Hamartomatous malformation composed of elements deriving from several components of the developing epidermis and epidermal appendages.

**LC0Y****Other specified developmental hamartomata of the epidermis and epidermal appendages****Developmental anomalies of skin pigmentation (LC10-LC1Y)**

Hamartomatous cutaneous malformations involving melanocytes including congenital pigmented naevi.

**Coded Elsewhere:** Congenital melanocytic naevus (2F20.2)

Familial multiple café-au-lait macules (EC23.0)

**LC10****Dermal melanocytosis**

The presence at birth of functional melanocytes within the dermis. Most commonly this is as a result of incomplete migration of melanocytes to the epidermis as in lumbosacral dermal melanocytosis (Mongolian spot). Less commonly it is due to circumscribed hamartomatous proliferation of melanocytes in the dermis (e.g. Naevus of Ota).

**Coded Elsewhere:** Phakomatosis caesioflammea (LD2D.Y)

Phakomatosis caesiomarmorata (LD2D.Y)

**LC1Y****Other specified developmental anomalies of skin pigmentation****Hamartomata derived from dermal connective tissue (LC20-LC2Y)**

Hamartomatous malformations of dermal collagen and elastin.

**LC20****Connective tissue hamartoma**

**Inclusions:** Connective tissue naevus

**LC2Y****Other specified hamartomata derived from dermal connective tissue****Developmental defects of hair or nails (LC30-LC31)****LC30****Developmental defects of hair or hair growth****LC31****Developmental defects of the nail apparatus**

Congenital malformations of the nail apparatus.

**Inclusions:** congenital abnormalities of the nails

**LC40****Dermoid cyst**

**Coded Elsewhere:** Dermoid cyst of eyelid (2F36.4)

## Developmental anomalies of cutaneous vasculature (LC50-LC5Z)

Congenital vascular malformations affecting the skin

**LC50****Developmental capillary vascular malformations of the skin**

**Coded Elsewhere:** Phakomatosis pigmentovascularis (LD2D.Y)

**LC50.0****Salmon patch**

A common skin condition of neonates, characterised by flat, deep-pink localised areas of capillary dilation that occur predominantly on the back of the neck, lower occiput, upper eyelids, upper lip, and bridge of the nose. The areas disappear permanently by about 2 years of age.

**LC50.1****Port-wine stain**

A port-wine stain is defined as a macular telangiectatic area of skin which is present at birth and does not spontaneously involute. Port-wine stains may be localised or extensive and they are often associated with an underlying disorder.

**Coded Elsewhere:** Sturge-Weber syndrome (LD23)

**LC50.Y****Other specified cutaneous capillary vascular malformation****LC51****Developmental venous malformations involving the skin**

Certain genetically-determined syndromes presenting with venous anomalies in the skin

**LC52****Complex or combined developmental vascular malformations involving the skin**

**Coded Elsewhere:** Angio-osteohypertrophic syndrome (LD26.60)

Cobb syndrome (LA90.3Y)

Maffucci syndrome (LD2F.1Y)

**LC5Y****Other specified developmental anomalies of cutaneous vasculature****LC5Z****Developmental anomalies of cutaneous vasculature, unspecified**

## Congenital anomalies of skin development (LC60-LC60)

**Coded Elsewhere:** Focal dermal hypoplasia (LD27.0Y)

Beckwith-Wiedemann syndrome (LD2C)

**LC60****Aplasia cutis congenita**

Congenital absence of skin. The commonest form presents as a defect limited to the scalp. It is also a component of a number of genetic syndromes.

**LC7Y****Other specified structural developmental anomalies of the skin**

**LC7Z****Structural developmental anomalies of the skin, unspecified**

Structural developmental anomalies of the adrenal glands (LC80-LC8Z)

A deformation established before birth of an anatomical structure of the adrenal glands.

**Exclusions:** Congenital adrenal hyperplasia (5A71.01)

**LC80****Congenital adrenal hypoplasia**

**Coded Elsewhere:** Congenital adrenocortical insufficiency (5A74.Y)

**LC8Y****Other specified structural developmental anomalies of the adrenal glands****LC8Z****Structural developmental anomalies of the adrenal glands, unspecified****LD0Y****Other specified structural developmental anomalies primarily affecting one body system****LD0Z****Structural developmental anomalies primarily affecting one body system, unspecified**

Multiple developmental anomalies or syndromes (LD20-LD2Z)

Complex developmental anomalies involving more than one body system

**LD20****Syndromes with central nervous system anomalies as a major feature**

**Exclusions:** Meckel syndrome (LD2F.13)

**LD20.0****Syndromes with cerebellar anomalies as a major feature**

**Coded Elsewhere:** Dysplastic cerebellar gangliocytoma (2A00.21)

**LD20.00****Joubert syndrome**

Joubert syndrome is a genetic midbrain-hindbrain malformation syndrome characterised by congenital malformation of the brainstem and agenesis or hypoplasia of the cerebellar vermis leading to an abnormal respiratory pattern, nystagmus, hypotonia, ataxia, and delay in achieving motor milestones.

**Coded Elsewhere:** Oral-facial-digital syndrome type 6 (LD25.00)

**LD20.01****Pontocerebellar hypoplasia**

Nonsyndromic pontocerebellar hypoplasias are a rare heterogeneous group of diseases characterised by hypoplasia and atrophy and/or early neurodegeneration of the cerebellum and pons. Eight subtypes named type 1-8 have been described, generally inherited in an autosomal recessive pattern.

**LD20.0Y****Other specified syndromes with cerebellar anomalies as a major feature****LD20.0Z****Syndromes with cerebellar anomalies as a major feature, unspecified**

| <b>LD20.1</b> | <p><b>Syndromes with lissencephaly as a major feature</b></p> <p>The term lissencephaly covers a group of rare malformations sharing the common feature of anomalies in the appearance of brain convolutions (characterised by simplification or absence of folding) associated with abnormal organisation of the cortical layers as a result of neuronal migration defects during embryogenesis. Children with lissencephaly have feeding and swallowing problems, muscle tone anomalies (early hypotonia and subsequently limb hypertonia), seizures (in particular, infantile spasms) and severe psychomotor retardation. Two large groups can be distinguished: classical lissencephaly (and its variants) and cobblestone lissencephaly.</p> <p><b>Inclusions:</b></p> <ul style="list-style-type: none"> <li>Agyria</li> <li>Pachygyria</li> </ul> |
| <b>LD20.2</b> | <p><b>Syndromes with microcephaly as a major feature</b></p> <p>Developmental syndromes in which an abnormally small head size is a significant feature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>LD20.3</b> | <p><b>Syndromes with holoprosencephaly as a major feature</b></p> <p>Any syndrome caused by failure of the prosencephalon to divide in two during the antenatal period. These syndromes may present with closely spaced eyes, cyclopia, flat nasal bridge, single maxillary central incisor, small head size, and clefts of the lip and palate.</p> <p><b>Coded Elsewhere:</b> Arrhinencephaly (LA05.4)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>LD24.3</b>  | <p><b>Spondyloepiphyseal or spondyloepimetaphyseal dysplasias</b></p> <p>Spondyloepiphyseal dysplasias (SED) are a heterogeneous group of congenital chondrodysplasias that specifically affect epiphyses and vertebrae. Their most frequent form is characterised by small neonatal size of ovid vertebrae and overall late growth of bones, more marked in the femoral heads, with a slightly irregular metaphyseal limit. Other clinical forms have been described, some of which were dominant and more or less severe with metaphyseal lesions, while others were recessive and included nephrotic syndrome, lymphopenia, and immune disorders (immune bone dysplasia).</p> |
| <b>LD24.4</b>  | <p><b>Spondylometaphyseal dysplasias</b></p> <p>Spondylometaphyseal dysplasias are a heterogeneous group of disorders associated with walking and growth disturbances that become evident during the second year of life. The disorders are characterised by platyspondyly (flattened vertebrae) and marked hip and knee metaphyseal lesions. The different forms of spondylometaphyseal dysplasia are distinguished by the localization and severity of involvement of the affected metaphyses.</p>                                                                                                                                                                             |

| <b>LD24.B0</b> | Short rib-polydactyly syndrome<br>Short rib-polydactyly syndromes are a group of bone malformations characterised by a narrow thorax and polydactyly (usually preaxial). Prevalence as a group is unknown. The group is heterogeneous and includes Jeune syndrome and Ellis-Van Creveld syndrome, neither of which are lethal, together with lethal chondrodysplasias: Saldino-Noonan (type 1), Majewski (type 2), Verma-Naumoff (type 3) and Beemer-Langer (type 4). |
| <b>LD24.B1</b> | Asphyxiating thoracic dystrophy<br>Asphyxiating thoracic dystrophy, also called Jeune syndrome, is a short-rib dysplasia characterised by a narrow thorax, short limbs and radiological skeletal abnormalities including "trident" aspect of the acetabula and metaphyseal changes.                                                                                                                                                                                   |

| <b>LD26.41</b> | <p>Arthrogryposis multiplex congenita</p> <p>Arthrogryposis multiplex congenita, comprises nonprogressive congenital conditions characterised by multiple joint contractures. The term is currently used in connection with a very heterogeneous group of disorders that all include multiple congenital joint contractures. The major cause of arthrogryposis is fetal akinesia due to fetal abnormalities (e.g. neurogenic, muscle, or connective tissue abnormalities; mechanical limitations to movement) or maternal disorders (e.g. infection, drugs, trauma, other maternal illnesses). Generalised fetal akinesia can also lead to polyhydramnios, pulmonary hypoplasia, micrognathia, ocular hypertelorism, and short umbilical cord. Lack of fetal movement causes extra connective tissue to develop around the joint, limiting movement and further aggravating the joint contracture.</p> <p><b>Exclusions:</b> COFS syndrome (LD2B)<br/>Arthrogryposis multiplex congenita - lissencephaly (LD2F.1)</p> <p><b>Coded Elsewhere:</b> Arthrogryposis - renal dysfunction - cholestasis (5C58.0Y)</p> |

| <b>LD26.60</b> | <p>Angio-osteohypertrophic syndrome</p> <p>Angio-osteohypertrophic (AOH) syndrome is a congenital vascular bone syndrome characterised by the presence of vascular malformations in a limb resulting in limb overgrowth. Depending on whether the malformations are slow flow venous or fast flow arteriovenous the syndrome may be divided into two subtypes, Klippel-Trénaunay and Parkes-Weber syndromes respectively. Some cases of the latter are associated with mutations in the RASA1 gene.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>LD27.00</b> | <p>Incontinentia pigmenti</p> <p>Incontinentia pigmenti is an X-linked dominant gene disorder due to abnormalities of the NF-kappa-B (NEMO) gene on chromosome Xq28. It is lethal in male fetuses but the presence of a normal second X chromosome in females results in a mosaicism which is compatible with life. Affected females present in infancy with skin blisters in linear arrays (Blaschko lines) typically on the scalp and limbs. Within the first few months of life these are succeeded by warty changes and hyperpigmentation. These tend to resolve over time, often leaving atrophic streaks. Associated features include abnormal dentition, ocular defects and a variety of neurological complications.</p> |
| <b>LD27.01</b> | <p>Cronkhite-Canada syndrome</p> <p>Cronkhite-Canada syndrome (CCS) is a sporadically occurring, noninherited disorder of generalised gastrointestinal polyps (hamartomas), cutaneous pigmentation, alopecia, and onychodystrophy. The possibility of progression to cancer is considered to be low. Chronic diarrhea and protein-losing enteropathy are often observed.</p>                                                                                                                                                                                                                                                                                                                                                    |
| <b>LD27.02</b> | <p>Hypohidrotic ectodermal dysplasia</p> <p>Hypohidrotic ectodermal dysplasia is a genetic disorder of ectoderm development characterised by malformation of ectodermal structures such as skin, hair, teeth and sweat glands. It comprises three clinically almost indistinguishable subtypes with impaired sweating as the key symptom: Christ-Siemens-Touraine syndrome (X-linked), autosomal recessive and autosomal dominant hypohidrotic ectodermal dysplasia, as well as a fourth rare subtype with immunodeficiency as the key symptom.</p>                                                                                                                                                                             |
| <b>LD27.03</b> | <p>Hidrotic ectodermal dysplasia, Clouston type</p> <p>Clouston syndrome (or hidrotic ectodermal dysplasia) is an inherited disorder characterised by the clinical triad of nail dystrophy, alopecia, and palmoplantar hyperkeratosis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

- LD27.3 Genetic syndromes with hypertrichosis**  
Genetic syndromes in which excessive non-androgen-dependent hair growth is associated with other abnormalities.  
**Coded Elsewhere:** Cone-rod type amaurosis congenita – congenital hypertrichosis (9B70)  
Ramon syndrome (LD2F.1Y)
- LD27.4 Genetic syndromes affecting nails**  
**Coded Elsewhere:** Wilson disease (5C64.00)  
Nail-patella syndrome (LD24.J0)  
Hidrotic ectodermal dysplasia, Clouston type (LD27.03)  
Severe T-cell immunodeficiency - congenital alopecia - nail dystrophy (4A01.1Y)  
Odonto-onycho-dermal dysplasia (LD27.0Y)  
Onycho-tricho-dysplasia – neutropaenia syndrome (LD27.0Y)  
Knuckle pads – leukonychia – sensorineural deafness (LD2H.Y)  
Deafness – enamel hypoplasia – nail defects (LD27.0Y)  
Anonychia with bizarre flexural pigmentation (LD27.0Y)  
Anonychia or onychodystrophy – hypoplasia or absence of distal phalanges (LD27.0Y)  
Autosomal dominant hypodontia with nail dysplasia (LD27.0Y)  
Amelo-onycho-hypohidrotic syndrome (LD27.0Y)  
Deafness – onychodystrophy (LD27.0Y)  
Odonto-onycho-hypohidrotic dysplasia - midline scalp defects (LD27.0Y)  
Tricho-odonto-onycho-dermal syndrome (LD27.0Y)  
Tricho-odonto-onychodysplasia - dominant syndactyly (LD27.0Y)  
Pili torti - onychodysplasia (LD27.0Y)  
Dyskeratosis congenita (3A70.0)  
Primary hypertrophic osteoarthropathy (FB86.10)
- LD27.5 Genetic hamartoneoplastic syndromes affecting the skin**  
A heterogeneous group of inherited diseases characterised by the presence of multiple hamartomata and associated with an increased risk of malignancy.  
**Coded Elsewhere:** Neurofibromatosis (LD2D.1)  
Tuberous sclerosis (LD2D.2)  
Gardner syndrome (LD2D.3)  
Gorlin syndrome (LD2D.4)  
Bannayan-Riley-Ruvalcaba syndrome (LD2D.Y)  
Cowden syndrome (LD2D.Y)  
Multiple familial trichoepithelioma (2F22)

| <b>LD28.00</b> | Congenital contractural arachnodactyly<br>Congenital contractural arachnodactyly (CCA, Beals syndrome) is a connective tissue disorder characterised by multiple flexion contractures, arachnodactyly, severe kyphoscoliosis, abnormal pinnae and muscular hypoplasia. Although the clinical features can be similar to Marfan syndrome (MFS), multiple joint contractures (especially of the elbow, knee, and finger joints), and crumpled ears in the absence of significant aortic root dilatation are characteristic of Beals syndrome and rarely found in MFS.                                                                                                                                                                                                                                               |
| <b>LD28.01</b> | Marfan syndrome<br>Marfan syndrome is a systemic disease of connective tissue characterised by a variable combination of cardiovascular, musculo-skeletal, ophthalmic and pulmonary manifestations. Cardiovascular involvement is characterised by 1) progressive dilation of the aorta accompanied by an increased risk of aortic dissection, which affects prognosis and 2) mitral insufficiency. Skeletal involvement is often the first sign of the disease and can include dolichostenomelia, large size, arachnodactyly, joint hypermobility, scoliotic deformations, acetabulum protrusion, thoracic deformity, dolichocephaly of the anteroposterior axis, micrognathism or malar hypoplasia. Ophthalmic involvement results in axile myopia, which can lead to retinal detachment and lens displacement. |

**LD2D.0****Peutz-Jeghers syndrome**

Peutz-Jeghers syndrome (PJS) is an autosomal dominant inherited disorder characterised by intestinal hamartomatous polyps in association with a distinct pattern of skin and mucosal macular melanin deposition. Patients have an increased risk of developing intestinal cancer.

**LD2D.1****Neurofibromatoses**

The neurofibromatoses (NF) are related genetic disorders which affect bone, soft tissue, skin and nervous system. In NF type 1 neurofibromas develop in the skin and elsewhere: these can cause problems as a result of their visibility in the skin, compression of vital internal structures or from malignant degeneration. Neuromas of the acoustic nerve are the predominant problem in NF type 2.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>LD2F.00</b> | <p>Fetal alcohol syndrome</p> <p>Fetal alcohol syndrome is a malformation syndrome caused by maternal consumption of alcohol during pregnancy. It is characterised by prenatal and/or postnatal growth deficiency (weight and/or height &lt;10th percentile); a unique cluster of minor facial anomalies (short palpebral fissures, flat and smooth philtrum, and thin upper lip) that presents across all ethnic groups is identifiable at birth, and does not diminish with age. Affected children present severe central nervous system abnormalities including: microcephaly, cognitive and behavioural impairment (intellectual disability, deficit in general cognition, learning and language, executive function, visual-spatial processing, memory, and attention).</p> <p><b>Coded Elsewhere:</b> Neurodevelopmental syndrome due to prenatal alcohol exposure (6A0Y)</p>                                                                                                                                |
| <b>LD2F.01</b> | <p>Fetal hydantoin syndrome</p> <p>Fetal hydantoin syndrome is a fetopathy likely to occur when a pregnant woman takes the anticonvulsant drug phenytoin (diphenylhydantoin) for epileptic seizures. In utero exposure to this drug may result in a characteristic dysmorphic syndrome in the newborn, including low-set hair, short neck with pterygium colli, small nose, deep nasal bridge, epicanthus, hypertelorism, large mouth, malformed ears, hypoplastic distal phalanges of the fingers and toes and finger-like thumbs. These dysmorphic features are often associated with growth retardation and delayed psychomotor development. The mechanism underlying these anomalies has been shown to depend on maternal genetic characteristics, i.e. on maternal capacity to detoxify intermediate metabolites of phenytoin.</p>                                                                                                                                                                            |
| <b>LD2F.02</b> | <p>Embryofetopathy due to oral anticoagulant therapy</p> <p>A condition caused by exposure of the embryo or fetus to anticoagulants during the antenatal period. This disease may present with optic nerve anomaly, optic atrophy, anomaly of the papilla, blindness, or choanal atresia.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>LD2F.03</b> | <p>Fetal Valproate Spectrum Disorder</p> <p>Fetal valproate spectrum disorder (FVSD) and Fetal valproate syndrome (FVS) describe the range of signs and symptoms which occur as a consequence of exposure to sodium valproate or valproic acid in the womb. A wide range of physical anomalies occur at increased frequency, including spina bifida, major and minor limb abnormalities, oral clefting, cardiac defects, hypospadias, and joint laxity. A characteristic pattern of facial dysmorphism is frequently present, especially notable in early childhood. Neurodevelopmental problems including reduced IQ, poorer language and motor development, increased rates of autistic spectrum disorder and attention deficit hyperactivity disorder are observed in up to 40% of those exposed. Vision problems such as myopia and astigmatism are also common. Risks are dose dependent and the impact on the brain may be seen at lower doses than those required for physical development alterations.</p> |

Dahlberg-Borer-Newcomer syndrome (LD27.0Y)

- LD2F.10** Prune belly syndrome  
A syndrome is characterised by cryptorchidism, urinary tract defects, and poor development of the abdominal muscles causing the skin on the abdomen to wrinkle.
- LD2F.11** VATER association  
VACTERL/VATER is an association of congenital malformations typically characterised by the presence of at least three of the following: vertebral defects, anal atresia, cardiac defects, tracheo-oesophageal fistula, renal anomalies, and limb abnormalities.
- LD2F.12** Sirenomelia  
Sirenomelia is a rare lethal malformation characterised by severe anomalies of the caudal part of the fetus that include a single lower limb, with various degrees of involvement ranging from single to separate femurs in the same skin shaft, presence of two feet (sympode mermaid) or one foot (monopode mermaid), to absence of both feet (ectromelic mermaid). Urogenital anomalies are also present and include bilateral renal agenesis, absence of outflow tract and absence of external genitalia. Imperforate anus and sacro-coccygeal agenesis have also been reported. Together these malformations comprise the extreme form of the caudal regression sequence.
- LD2F.13** Meckel-Gruber syndrome  
Meckel syndrome (MKS) is a monogenic disease characterised by a combination of renal cysts and variably associated features, including developmental anomalies of the central nervous system (usually occipital encephalocele), hepatic ductal dysplasia and cysts, and polydactyly, and a lethal course, with death occurring in the perinatal period.
- LD2F.14** MURCS association  
MURCS association, which stands for Müllerian duct aplasia (MU), congenital renal dysplasia (R), cervical somite anomalies (CS), is the atypical (or type II) form of Mayer-Rokitansky-Küster-Hauser syndrome, characterised by utero-vaginal atresia in otherwise normal females as well associated kidney and skeletal abnormalities and hearing problems.
- LD2F.15** Noonan syndrome  
Noonan Syndrome is characterised by short stature, facial dysmorphism and congenital heart defects. The main facial features of NS are hypertelorism with down-slanting palpebral fissures, ptosis and low-set posteriorly rotated ears with a thickened helix. The cardiovascular defects most commonly associated with this condition are pulmonary stenosis and hypertrophic cardiomyopathy. Other associated features are webbed neck, chest deformity, mild intellectual deficit, cryptorchidism, poor feeding in infancy, bleeding tendency and lymphatic dysplasia. The syndrome is transmitted as an autosomal dominant trait.

| <b>LD2H.0</b> | <b>Fraser syndrome</b>                                               | Fraser syndrome is a rare syndrome characterised by cryptophthalmos and syndactyly and associated with a wide variety of other anomalies including: middle and outer ear malformations; high-arched palate; cleavage along the midplane of nares and tongue; hypertelorism; laryngeal stenosis; wide separation of symphysis pubis; displacement of umbilicus and nipples; absent or multicystic kidneys; bicornuate uterus, malformed Fallopian tubes, fusion of labia and enlargement of clitoris in girls; and undescended testes and small penis with hypospadias in boys. |
| <b>LD2H.1</b> | <b>Neuropathy with hearing impairment</b>                            | Neuropathy with hearing impairment is characterised by the association of sensorineural hearing impairment and peripheral demyelinating and predominantly sensory neuropathy.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>LD2H.2</b> | <b>Progressive deafness with stapes fixation</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>LD2H.3</b> | <b>Waardenburg-Shah syndrome</b>                                     | In this syndrome the phenotype includes not only the classical features of Waardenburg syndrome but also Hirschsprung disease. It may be caused by mutations in SOX10, EDN3 or EDNRB genes.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>LD2H.4</b> | <b>Usher syndrome</b>                                                | Usher syndrome is the most common cause of hereditary combined deafness-blindness, and is characterised by the association of sensorineural deafness (usually congenital) with retinitis pigmentosa and progressive vision loss.                                                                                                                                                                                                                                                                                                                                               |
| <b>LD2H.Y</b> | <b>Other specified syndromic genetic deafness</b>                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>LD2H.Z</b> | <b>Syndromic genetic deafness, unspecified</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>LD2Y</b>   | <b>Other specified multiple developmental anomalies or syndromes</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Chromosomal anomalies, excluding gene mutations (LD40-LD7Z)

Any disease caused by alteration of the number or structure of chromosomes.

|             |                                            |                                                                                                                                                                 |
|-------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LD40</b> | <b>Complete trisomies of the autosomes</b> | Any disease caused by the presence of one extra autosome, for a total of three. Confirmation is through observation of a supernumerary autosome by karyotyping. |
|-------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## **LD42**

### **Polyploidies**

Any disease caused by one or more additional sets of chromosomes. Non-mosaic versions of these diseases are characterised by gross fetal malformation or death of the fetus. Confirmation is through observation of supernumerary sets of chromosomes by karyotyping.

#### **LD42.0**

##### **Triploidy**

A disease caused by one additional set of chromosomes, for a total of 69 chromosomes. Triploidy can present with albuminuria, oedema, or hypertension in the mother. The fetus may present with microcephaly and a placenta that is enlarged and filled with cysts in the case of extra maternally inherited chromosomes, while extra paternally inherited chromosomes cause severe growth problems, an enlarged head, and a small placenta that does not have cysts. Non-mosaic triploidy is highly lethal, and is rarely observed in live births. Confirmation is through observation of an additional set of chromosomes by karyotyping.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LD42.1</b>  | <b>Tetraploidy</b>                                                                                                                                                                                                                                                                                                                                                                                                             |
|                | A disease caused by two additional sets of chromosomes, for a total of 92 chromosomes. This disease commonly results in spontaneous abortion during the first trimester. Live births of tetraploidy individuals are very rare. These cases are characterised by facial dysmorphism, severely delayed growth and developmental delay. Confirmation is through observation of two additional sets of chromosomes by karyotyping. |

Sex chromosome anomalies (LD50-LD5Z)

Any disease caused by change in the number or structure of the X or Y chromosome. Confirmation is by observation of a chromosomal anomaly by genetic testing.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>LD50.0</b>  | <b>Turner syndrome</b><br>Karyotype missing one X chromosome (45,X0 or 45,X0/46,XX mosaicism); gonads: ovaries (streak); phenotype female with short stature, amenorrhea (hypergonadotropic hypogonadism), absence of sexual development, webbed neck, low set ears, posterior hairline, widely-spaced nipples, short fourth metacarpals, and increased carrying angle at the elbow (cubitus valgus). Often associated with renal, cardiac and ocular abnormalities.<br><br><b>Inclusions:</b> Monosomy X<br><b>Exclusions:</b> Noonan syndrome (LD2F.15) |
| <b>LD50.00</b> | Karyotype 45, X<br>A disease affecting females, caused by absence of one of the two X chromosomes. This disease may present with short stature, extra folds of skin on the neck, a low hairline at the back of the neck, puffiness or swelling of the hands and feet, skeletal abnormalities, ovarian hypofunction or premature ovarian failure, kidney problems, or heart defects. Confirmation is through observation of only one X chromosome by karyotyping.                                                                                          |

- LD50.01**      **Karyotype 46, X iso Xq**  
 A disease affecting females, caused by one of the two X chromosomes consisting of two q arms, which are structurally identical and contain the same genes. This disease may present with short stature, extra folds of skin on the neck, a low hairline at the back of the neck, puffiness or swelling of the hands and feet, skeletal abnormalities, ovarian hypofunction or premature ovarian failure, kidney problems, or heart defects. This disease may be differentiated from classical Turner Syndrome by a near complete lack of gonadal development, resulting in a lack of menstruation or breast development. Confirmation is through observation of an iso Xq chromosome by karyotyping.
- LD50.02**      **Karyotype 46, X with abnormal sex chromosome, except iso Xq**
- LD50.03**      **Mosaicism, 45, X, 46, XX or XY**  
 A disease caused by embryonic fusion, or by the loss of one of the sex chromosomes from a cell early in embryonic development; Gonadal status: normal or variable abnormalities of sexual anatomy, maturation or function. Phenotype: normal, or abnormal sexual development.
- LD50.04**      **Mosaicism, 45, X or other cell line with abnormal sex chromosome**  
 A disease caused by embryonic fusion or the structural mutation of a sex chromosome early in embryonic development, resulting in a subset of cells in the body having one normal copy of the X chromosome and one abnormal sex chromosome. This disease may present with short stature, sexual organ dysfunction, or may be asymptomatic.
- LD50.1**      **Karyotype 47,XXX**  
 Trisomy X is a sex chromosome anomaly with a variable phenotype caused by the presence of an extra X chromosome in females (47,XXX instead of 46,XX). Most individuals are only mildly affected or asymptomatic, the most common physical features including tall stature, epicanthal folds, hypotonia and clinodactyly, with seizures, renal and genitourinary abnormalities, and premature ovarian failure being also associated findings.
- LD50.2**      **Mosaicism, lines with various numbers of X chromosomes**  
 A disease caused by embryonic fusion or gain or loss of X chromosomes early in embryonic development, resulting in a subset of cells in the body having an abnormal number of X chromosomes. This disease may present with abnormal height, genitourinary abnormalities, or may be asymptomatic.
- LD50.3**      **Klinefelter syndrome**  
 Klinefelter syndrome defines a group of chromosomal disorders in which there is at least one extra X chromosome compared with the normal 46,XY male karyotype. The effects on physical features and on physical and cognitive development increase with the number of extra X's, and each extra X is associated with an intelligence quotient (IQ) decrease of approximately 15-16 points, with language most affected, particularly expressive language skills.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LD50.30</b> | <p>Klinefelter syndrome with karyotype 47,XXY, regular</p> <p>Karyotype 47 XXY; gonads: testes (hypogonadism) small and firm with decreased spermatogenesis ; phenotype male with associated congenital abnormalities (decreased virilization due to decreased testosterone production, long arms and legs, short trunk, psychosocial problems).</p>                                                                                                                                                                                                                |
| <b>LD50.31</b> | <p>Klinefelter syndrome, male with more than two X chromosomes</p> <p>A disease affecting males, caused by the presence of more than two X chromosomes in each cell. This disease is characterised by impaired sexual development, intellectual disability, distinctive facial features, skeletal abnormalities, poor coordination, and severe problems with speech. This disease may be differentiated from classic Klinefelter syndrome by increased severity of symptoms. Confirmation is through observation of more than two X chromosomes by karyotyping.</p> |
| <b>LD50.3Y</b> | Other specified Klinefelter syndrome                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Conditions with disorders of intellectual development as a relevant clinical feature

**Coded Elsewhere:** Lesch-Nyhan syndrome (5C55.01)

Hydrocephalus with stenosis of the aqueduct of Sylvius (LA04.0)

Pelizaeus-Merzbacher disease (8A44.0)

Hereditary sensory and autonomic neuropathy type IV (8C21.2)

Joubert syndrome (LD20.00)

Phenylketonuria (5C50.0)

Tyrosinaemia type 2 (5C50.12)

Carbamoylphosphate synthetase deficiency (5C50.A1)

Carnosinaemia (5C50.F1)

Homocarnosinosis (5C50.F2)

Syndromes with lissencephaly as a major feature (LD20.1)

Sjögren-Larsson syndrome (5C52.03)

Polymicrogyria (LA05.50)

Porencephaly (LA05.60)

Pyruvate dehydrogenase complex deficiency (5C53.02)

Brain-lung-thyroid syndrome (CB04.5)

Metachromatic leukodystrophy (5C56.02)

Neuronal ceroid lipofuscinosis (5C56.1)

Mucopolysaccharidosis type 2 (5C56.31)

Mucopolysaccharidosis type 6 (5C56.33)

Oculocerebrorenal syndrome (5C60.0)

CATCH 22 phenotype (LD44.N0)

Langer-Giedion syndrome (LD24.80)

Crigler-Najjar syndrome (5C58.00)

Fragile X chromosome (LD55)

Incontinentia pigmenti (LD27.00)

Tuberous sclerosis (LD2D.2)

Noonan syndrome (LD2F.15)

Congenital rubella syndrome (KA62.8)

Congenital cytomegalovirus infection (KA62.3)

Complete trisomy 21 (LD40.0)

Klinefelter syndrome, male with more than two X chromosomes (LD50.31)

Intellectual disability – enteropathy – deafness – neuropathy – ichthyosis – keratoderma syndrome (LD2H.Y)

Microcephaly - deafness - intellectual disability (LD2H.Y)

Schizophrenia - intellectual disability - deafness - retinitis (LD2H.Y)

Corneal anaesthesia - deafness - intellectual disability  
(LD2H.Y)

Ataxia - deafness - intellectual disability syndrome (LD2H.Y)

Retinitis pigmentosa - intellectual disability - deafness -  
hypogenitalism (LD2H.Y)

**LD90.0      Angelman syndrome**

Angelman syndrome is a neurogenetic disorder characterised by severe intellectual deficit and distinct facial dysmorphic (microcephaly, macrostomia, maxillary hypoplasia, prognathia), behavioural (outbursts of laughter with hand flapping, a happy demeanour, hyperactivity without aggression, short attention span, excitability and sleeping problems with decreased need to sleep, increased sensitivity to heat, attraction to and fascination with water), and neurological features (a puppet-like gait, ataxia and epileptic seizures).

**LD90.1      Early-onset parkinsonism - intellectual deficit**

Early-onset parkinsonism with intellectual deficit is a basal ganglia disorder characterised by parkinsonian-type symptoms (postural changes, tremor, rigidity), megalencephaly and variable intellectual deficit. Other signs are frontal bossing, persistent frontal lobe reflexes, strabismus and seizures.

**LD90.2      Pelizaeus-Merzbacher-like disease**

Pelizaeus-Merzbacher-like disease (PMLD) is an autosomal recessive leukodystrophy sharing identical clinical and radiological features as X-linked Pelizaeus-Merzbacher disease (PMD).

**LD90.3      Prader-Willi syndrome**

Prader-Willi syndrome is a rare genetic disorder characterised by hypothalamic-pituitary abnormalities with severe hypotonia during the neonatal period and first two years of life and the onset of hyperphagia with a risk of morbid obesity during infancy and adulthood, learning difficulties and behavioural problems or severe psychiatric problems.

**LD90.4      Rett syndrome**

A condition in which apparently normal early development is followed by partial or complete loss of speech and of skills in locomotion and use of hands, together with deceleration in head growth, usually with an onset between seven and 24 months of age. Loss of purposive hand movements, hand-wringing stereotypies, and hyperventilation are characteristic. Social and play development are arrested but social interest tends to be maintained. Trunk ataxia and apraxia start to develop by age four years and choreoathetoid movements frequently follow. Severe mental retardation almost invariably results.

**LD90.Y      Other specified conditions with disorders of intellectual development as a relevant clinical feature**

**LD90.Z      Conditions with disorders of intellectual development as a relevant clinical feature, unspecified**

**LD9Y      Other specified developmental anomalies**

**LD9Z      Developmental anomalies, unspecified**

## CHAPTER 21

---

### Symptoms, signs or clinical findings, not elsewhere classified

This chapter has 311 four-character categories.

Code range starts with MA00

Clinical findings include those found using physical, laboratory and imaging techniques.

Diseases can manifest in many ways and in different body systems. Such specific manifestations may be a reason for treatment or encounter, with or without identifying or addressing the underlying condition.

Categories in this chapter include the less well-defined conditions and symptoms that, without the necessary study of the case to establish a final diagnosis, could be designated 'not otherwise specified', 'unknown aetiology' or 'transient'.

The conditions and signs or symptoms included in this chapter consist of:

- cases for which no more specific diagnosis can be made even after all the facts bearing on the case have been investigated
- signs or symptoms existing at the time of initial encounter that proved to be transient and whose causes could not be determined;
- provisional diagnoses in a patient who failed to return for further investigation or care;
- cases referred elsewhere for investigation or treatment before the diagnosis was made;
- cases in which a more precise diagnosis was not available for any other reason;
- certain symptoms, for which supplementary information is provided, that represent important problems in medical care in their own right.

These categories should be used in conjunction with a code from another chapter that identifies the underlying condition.

**Exclusions:**            Certain conditions originating in the perinatal period (Chapter 19)  
                                 Clinical findings on antenatal screening of mother (JA66)

This chapter contains the following top level blocks:

- Symptoms of blood, blood-forming organs, or the immune system
- Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system
- Symptoms, signs or clinical findings of endocrine, nutritional or metabolic diseases
- Symptoms, signs or clinical findings of speech or voice
- Mental or behavioural symptoms, signs or clinical findings
- Symptoms, signs or clinical findings of the nervous system
- Symptoms, signs or clinical findings of the visual system
- Symptoms, signs or clinical findings of ear or mastoid process
- Symptoms, signs or clinical findings of the circulatory system

- Symptoms, signs or clinical findings of the respiratory system
- Symptoms, signs or clinical findings of the digestive system or abdomen
- Symptoms, signs or clinical findings involving the skin
- Symptoms, signs or clinical findings of the musculoskeletal system
- Symptoms, signs or clinical findings of the genitourinary system
- General symptoms, signs or clinical findings
- Ill-defined and unknown causes of mortality

## Symptoms of blood, blood-forming organs, or the immune system (MA00-MA0Y)

**Coded Elsewhere:** Fear of haematological disease (MG24.2)

## Symptoms, signs or clinical findings of blood, blood-forming organs, or the immune system (MA10-MA3Y)

Clinical findings in blood, blood-forming organs, or the immune system (MA10-MA1Y)

**Exclusions:**

- abnormalities of coagulation (3B10-3B4Z)
- abnormalities of lipids (5C80-5C8Z)
- Thrombocytopenia (3B64)
- Abnormal haematological finding on antenatal screening of mother (JA66.0)
- Haemorrhagic or haematological disorders of fetus or newborn (KA80-KA8Z)

**MA10**      **Abnormal serum enzyme levels**

**MA18****Certain clinical findings of blood chemistry**

- Exclusions:**
- specific findings indicating disorder of: carbohydrate metabolism (5C51)
  - specific findings indicating disorder of: amino-acid metabolism (5C50)
  - specific findings indicating disorder of: lipid metabolism (5C52)
  - asymptomatic hyperuricaemia (5C55)
  - abnormality of fluid, electrolyte or acid-base balance (5C70-5C7Z)
  - Neonatal hypoglycaemia (KB60.4)

**MA18.0 Elevated blood glucose level**

- Exclusions:**
- Diabetes mellitus in pregnancy (JA63)
  - Syndrome of infant of mother with gestational diabetes (KB60.0)
  - Postprocedural hypoinsulinaemia (5D41)
  - Syndrome of infant of a diabetic mother, type 1 or 2, nongestational, insulin dependent (KB60.1)
  - Neonatal diabetes mellitus (KB60.2)
- Coded Elsewhere:** Neonatal hyperglycaemia (KB60.3)

**MA18.00** Abnormal glucose tolerance test

Greater than normal levels of glucose found in laboratory examination of the blood to check how the body breaks down (metabolizes) blood sugar. Positive findings may indicate diabetes or Cushing diseases, among other things.

**MA18.0Y** Other specified elevated blood glucose level

**MA18.0Z** Elevated blood glucose level, unspecified

**MA18.1 Abnormal level of blood mineral**

- Inclusions:** Abnormal blood level of mineral NEC
- Exclusions:**
- nutritional mineral deficiency (5B5K)
  - Neonatal hypomagnesaemia (KB61.0)

**MA18.2** Abnormal arterial blood-gas level

**MA18.3** Abnormal coagulation profile

**MA18.4** Low haemoglobin

- Exclusions:** Low affinity haemoglobin (3A51.8)

**MA18.Y** Other specified abnormal findings of blood chemistry

**MA18.Z** Abnormal findings of blood chemistry, unspecified

**MA81****Speech dysfluency**

Speech dysfluency is characterised by the frequent or pervasive disruption of the rhythmic flow of speech that arises subsequent to the developmental period (i.e., adult onset) and is outside the limits of normal variation and results in reduced intelligibility and significantly affects communication. It can involve repetitions of sounds, syllables or words, prolongations, word breaks, blockage of production, excessive use of interjections, and rapid short bursts of speech.

**Exclusions:**

- Developmental language disorder (6A01.2)
- Developmental speech or language disorders (6A01)
- Developmental speech fluency disorder (6A01.1)
- Dysarthria (MA80.2)
- Selective mutism (6B06)
- childhood onset stammering (6A01.1)
- childhood onset stuttering (6A01.1)
- childhood onset cluttering (6A01.1)
- childhood-onset speech fluency disorder (6A01.1)

**MA82****Voice disturbances**

Voice disturbances include dysphonia, aphonia, hypernasality and hyponasality, and other voice disturbances.

**MA82.0****Aphonia**

Aphonia is the inability to produce voice. It is considered more severe than dysphonia. Like dysphonia, aphonia can be caused by voice strain or overuse, injury, by structural laryngeal anomalies or by dystonic neurological disorders.

**Inclusions:** Loss of voice

**Exclusions:** Dissociative disorders (6B60-6B6Z)

**MA82.1****Dysphonia**

Difficulty and/or pain in phonation or speaking.

**Exclusions:**

- Developmental speech or language disorders (6A01)
- Developmental speech fluency disorder (6A01.1)

**MA82.10**

Hoarseness

**MA82.1Y**

Other specified dysphonia

**MA82.1Z**

Dysphonia, unspecified

**MA82.2****Nasality**

Nasality (or resonance) refers to the quality of the voice that is determined by the balance of sound vibration in the oral, nasal, and pharyngeal cavities during speech. Abnormal resonance can occur when there is obstruction in one of the cavities, causing hyponasality, or when there is velopharyngeal dysfunction, causing hypernasality. This category should only be assigned when hyponasality or hypernasality is outside the limits of normal variation and results in reduced intelligibility and significantly affects communication.

## Mental or behavioural symptoms, signs or clinical findings (MB20-MB2Y)

### **MB20**      **Symptoms, signs or clinical findings involving consciousness**

Symptoms, signs, and clinical findings indicative of a disturbance in the state or quality of awareness of oneself and the environment, alertness, or clarity of the wakeful state.

**Exclusions:**              newborn uremic coma (KC01)  
                                  Delirium (6D70)  
                                  Psychomotor retardation (MB23.N)

#### **MB20.0**      **Stupor**

Total or nearly total lack of spontaneous movement and marked decrease in reactivity to environment.

**Inclusions:**              Semicoma  
**Exclusions:**              Catatonia (6A40-6A4Z)  
                                  Delirium (6D70)

#### **MB20.1**      **Coma**

Acute state lasting more than one hour and usually less than a month. The comatose patient is unresponsive, lying with their eyes closed and cannot be aroused even by vigorous and noxious stimuli. Motor responses to noxious stimulation are limited to reflexive behaviour. Etiologies include but are not limited to traumatic, anoxic, infectious, neoplastic, vascular, inflammatory and metabolic brain injuries.

**Coding Note:**      Code also the causing condition

**Exclusions:**              Diabetic coma (5A23)  
                                  Hepatic coma (DB99.5)  
                                  Neonatal coma (KB03)  
                                  Nondiabetic hypoglycaemic coma (5A41)  
                                  chronic uremic coma (GB61)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB20.2</b>  | <b>Clouding of consciousness</b><br>An impairment in the clarity of consciousness characterised by impaired ability to comprehend aspects of the environment or the self in relation to the environment, inattention, and abnormalities in thought processes, comprehension. It is typically accompanied by subjective experience of mental clouding described as feeling 'foggy'. Clouding of consciousness is a common form of cognitive disturbance in Delirium, but it is not synonymous with Delirium because Delirium includes additional diagnostic requirements.<br><i><b>Exclusions:</b></i> Delirium (6D70) |
| <b>MB20.Y</b>  | <b>Other specified symptoms, signs or clinical findings involving consciousness</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>MB21.2</b>  | <b>Anosognosia</b><br>A lack of awareness or failure to recognize one's own illness, symptoms, or functional deficits, considered to be an aspect of the illness.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|               |                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB21.3</b> | <b>Confabulation</b><br>The filling of memory gaps with fabricated, distorted, or misinterpreted memories about oneself or the world, without the conscious intention to deceive.                                                                                                                                       |
| <b>MB21.4</b> | <b>Disorientation</b><br>Impairment in or loss of awareness of the position of the self in relation to place, time, situation, or other persons. In severe cases, the sense of personal identity may also be lost.                                                                                                      |
| <b>MB21.5</b> | <b>Distractibility</b><br>Difficulty focusing on tasks; attention is easily diverted by extraneous stimuli.                                                                                                                                                                                                             |
| <b>MB21.6</b> | <b>Impaired abstract thinking</b><br>The inability to use concepts and to make and understand generalizations, such as the identifying the properties or pattern shared by a variety of specific items or events.                                                                                                       |
| <b>MB21.7</b> | <b>Impaired executive functioning</b><br>Impairment in higher-level cognitive abilities, such as planning, sequencing, concept formation, abstracting, and decision-making.                                                                                                                                             |
| <b>MB21.8</b> | <b>Impaired judgment</b><br>Deficit in the capacity to make sound, reasoned, and responsible decisions.                                                                                                                                                                                                                 |
| <b>MB21.9</b> | <b>Perseveration</b><br>Persistent repetition of previously used words, phrases, or details that are not responsive to the demands of the situation.                                                                                                                                                                    |
| <b>MB21.A</b> | <b>Poor concentration</b><br>Difficulty focusing attention and sustaining the mental energy necessary to accomplish a task or goal.                                                                                                                                                                                     |
| <b>MB21.B</b> | <b>Racing thoughts</b><br>Subjective perception of accelerated thought processes.                                                                                                                                                                                                                                       |
| <b>MB21.Y</b> | <b>Other specified symptoms and signs involving cognition</b>                                                                                                                                                                                                                                                           |
| <b>MB21.Z</b> | <b>Symptoms and signs involving cognition, unspecified</b>                                                                                                                                                                                                                                                              |
| <b>MB22</b>   | <b>Symptoms or signs involving motivation or energy</b><br>Symptoms and signs involving motivation (the process that initiates, guides, and maintains goal-oriented behaviours) or energy (the strength and vitality required for sustained physical or mental activity).<br><br><b>Coded Elsewhere:</b> Fatigue (MG22) |
| <b>MB22.0</b> | <b>Avolition</b><br>A general lack of drive, or lack of motivation to pursue meaningful goals (e.g., as evidenced by limited participation in work, school, or socializing with others).                                                                                                                                |

|               |                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB22.1</b> | <b>Decreased libido</b><br>Decreased sexual desire or sexual activity compared with the patient's usual levels of sexual interest and functioning.                                                                                                                                                               |
| <b>MB22.2</b> | <b>Demoralization</b><br>Loss of confidence in one's ability to cope, with associated feelings of helplessness, hopelessness, and discouragement.                                                                                                                                                                |
| <b>MB22.3</b> | <b>Hopelessness</b><br>Little or no belief in a positive future.                                                                                                                                                                                                                                                 |
| <b>MB22.4</b> | <b>Increased energy</b><br>Increased physical or mental resources for activity, typically characterised by increased capacity for work and greater efficiency in responding to stimuli.                                                                                                                          |
| <b>MB22.5</b> | <b>Increased goal-directed activity</b><br>Increased planning of and participation in multiple activities (e.g. sexual, occupational, political, religious), compared to the individual's typical level of activity.                                                                                             |
| <b>MB22.6</b> | <b>Increased libido</b><br>Increased sexual desire or sexual activity compared with the patient's usual levels of sexual interest and functioning.                                                                                                                                                               |
| <b>MB22.7</b> | <b>Tiredness</b><br>Feeling of reduced alertness and an accompanying decrease in mental acuity, in some cases resulting in an impulse or tendency to fall asleep.                                                                                                                                                |
| <b>MB22.Y</b> | <b>Other specified symptoms and signs involving motivation or energy</b>                                                                                                                                                                                                                                         |
| <b>MB22.Z</b> | <b>Symptoms or signs involving motivation or energy, unspecified</b>                                                                                                                                                                                                                                             |
| <b>MB23</b>   | <b>Symptoms or signs involving appearance or behaviour</b><br><i>Coded Elsewhere:</i> Speech dysfluency (MA81)                                                                                                                                                                                                   |
| <b>MB23.0</b> | <b>Aggressive behaviour</b><br>Actions intended to threaten or hurt another person or to damage property that may be physical, verbal, or symbolic (e.g., acting against the other person's interests). Aggressive behaviour may be appropriate and self-protective, or inappropriate, hostile, and destructive. |
| <b>MB23.1</b> | <b>Antisocial behaviour</b><br>Behaviour in which the basic rights of others or major age-appropriate societal norms, rules, or laws, are violated.                                                                                                                                                              |
| <b>MB23.2</b> | <b>Avoidance behaviour</b><br>The act of keeping away from circumstances, situations, or stimuli that cause anxiety or other negative emotions in the individual.                                                                                                                                                |
| <b>MB23.3</b> | <b>Bradyphrenia</b><br>Slowness of thoughts or fatigability of initiative                                                                                                                                                                                                                                        |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>MB23.Q</b> | <b>Social withdrawal</b><br>Retreat from relationships and other social interactions                                                                                                                                                                                     |
| <b>MB23.R</b> | <b>Suicide attempt</b><br>A specific episode of self-harming behaviour undertaken with the conscious intention of ending one's life.                                                                                                                                     |
| <b>MB23.S</b> | <b>Suicidal behaviour</b><br>Concrete actions, such as buying a gun or stockpiling medication, that are taken in preparation for fulfilling a wish to end one's life but that do not constitute an actual suicide attempt.                                               |
| <b>MB23.Y</b> | <b>Other specified symptoms and signs involving appearance and behaviour</b>                                                                                                                                                                                             |
| <b>MB23.Z</b> | <b>Symptoms and signs involving appearance and behaviour, unspecified</b>                                                                                                                                                                                                |
| <b>MB24</b>   | <b>Symptoms or signs involving mood or affect</b><br>Symptoms and signs involving the regulation and expression of emotions or feeling states.                                                                                                                           |
| <b>MB24.0</b> | <b>Ambivalence</b><br>Conflicting ideas, wishes, or feelings toward a person, thing or situation that are distressing and may create difficulties in making decisions.                                                                                                   |
| <b>MB24.1</b> | <b>Anger</b><br>An emotional state related to one's psychological interpretation of having been threatened that may range in intensity from mild irritation to intense fury and rage.                                                                                    |
| <b>MB24.2</b> | <b>Anhedonia</b><br>Inability to experience pleasure from normally pleasurable activities.                                                                                                                                                                               |
| <b>MB24.3</b> | <b>Anxiety</b><br>Apprehensiveness or anticipation of future danger or misfortune accompanied by a feeling of worry, distress, or somatic symptoms of tension. The focus of anticipated danger may be internal or external.<br><i><b>Inclusions:</b></i> Nervous tension |
| <b>MB24.4</b> | <b>Apathy</b><br>A reduction or lack of feeling, emotion, interest, or concern; a state of indifference.                                                                                                                                                                 |
| <b>MB24.5</b> | <b>Depressed mood</b><br>Negative affective state characterised by low mood, sadness, emptiness, hopelessness, or dejection<br><i><b>Exclusions:</b></i> Mood disorders (6A60-6A8Z)<br>Low self-esteem (MB28.9)                                                          |

|                |                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB24.6</b>  | <b>Disturbance of affect</b><br>A disturbance in the expression or outward manifestation of mood.                                                                                       |
| <b>MB24.60</b> | <b>Constricted affect</b><br>A marked reduction in the expressive range and intensity of affect, but less than is observed in Blunted affect.                                           |
| <b>MB24.61</b> | <b>Blunted affect</b><br>A severe reduction in the expressive range and intensity of affect, but less than is observed in Flat affect.                                                  |
| <b>MB24.62</b> | <b>Flat affect</b><br>Absence or near absence of any sign of affective expression.                                                                                                      |
| <b>MB24.63</b> | <b>Labile affect</b><br>Marked variability in emotional expression, with repeated, rapid, and abrupt shifts.                                                                            |
| <b>MB24.64</b> | <b>Inappropriate affect</b><br>Affective expression that is discordant with the content of the person's speech or ideation, or incompatible with the demands of a particular situation. |
| <b>MB24.6Y</b> | <b>Other specified disturbance of affect</b>                                                                                                                                            |
| <b>MB24.6Z</b> | <b>Disturbance of affect, unspecified</b>                                                                                                                                               |
| <b>MB24.7</b>  | <b>Dysphoria</b><br>An unpleasant mood state, which can include feelings of depression, anxiety, discontent, irritability, and unhappiness                                              |
| <b>MB24.8</b>  | <b>Elevated mood</b><br>A positive mood state typically characterised by increased energy and self-esteem which may be out of proportion to the individual's life circumstances.        |
| <b>MB24.9</b>  | <b>Euphoria</b><br>An exaggerated feeling of physical and emotional well-being and vitality.                                                                                            |
| <b>MB24.A</b>  | <b>Fear</b><br>An emotional response to perceived imminent threat or danger associated with urges to flee or fight.                                                                     |
| <b>MB24.B</b>  | <b>Feelings of guilt</b><br>Remorse related to past events or one's past actions (or inaction), thoughts, or desires.                                                                   |
| <b>MB24.C</b>  | <b>Irritability</b><br>A mood state characterised by being easily annoyed and provoked to anger, out of proportion to the circumstances.                                                |

|                |                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB24.D</b>  | <b>Leadен paralysis</b><br>A feeling that one's arms or legs are as heavy as lead, associated with a form of depression that also commonly includes overeating and oversleeping.                                                                                                                                                         |
| <b>MB24.E</b>  | <b>Mental rumination</b><br>Mental preoccupation with negative events, personal characteristics, or failures.                                                                                                                                                                                                                            |
| <b>MB24.F</b>  | <b>Restlessness</b><br>A feeling of being unable to keep still.                                                                                                                                                                                                                                                                          |
| <b>MB24.G</b>  | <b>Tantrum</b><br>An emotional outburst, usually among children or those in emotional distress, that is typically characterised by stubbornness, crying, screaming, defiance, anger, a resistance to attempts at pacification, and in some cases hitting or other violent behaviour.                                                     |
| <b>MB24.H</b>  | <b>Worry</b><br>Unpleasant thoughts that are difficult to control, related to anticipated potential negative events.                                                                                                                                                                                                                     |
| <b>MB24.Y</b>  | <b>Other specified symptoms and signs involving mood or affect</b>                                                                                                                                                                                                                                                                       |
| <b>MB24.Z</b>  | <b>Symptoms and signs involving mood or affect, unspecified</b>                                                                                                                                                                                                                                                                          |
| <b>MB25</b>    | <b>Symptoms or signs involving form of thought</b><br>Symptoms and signs involving the logical sequence and coherence of thought, typically manifest in speech, including thought disorder (circumstantiality, tangentiality, disorganised thinking and incoherence), flight of ideas, neologisms, and thought blocking.                 |
| <b>MB25.0</b>  | <b>Symptoms and signs of thought disorder</b><br>Disturbances in the associative thought process typically manifest in speech or writing that range from circumstantiality to incoherence. These may be indicative of Schizophrenia and other primary psychotic disorders but can also occur in other mental disorders (e.g., Delirium). |
| <b>MB25.00</b> | <b>Circumstantiality</b><br>A relatively mild disturbance in the associative thought process typically manifest in speech or writing characterised by delay in getting to the point because of the interpolation of unnecessary details and irrelevant parenthetical remarks.                                                            |
| <b>MB25.01</b> | <b>Tangentiality</b><br>A disturbance in the associative thought process typically manifest in speech in which the person tends to digress readily from the topic under discussion to other topics through associations without ever returning to the original topic.                                                                    |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB25.02</b> | <p>Disorganised thinking</p> <p>A disturbance in the associative thought process typically manifested in speech in which the person shifts suddenly from one topic to another that is unrelated or minimally related to the first. The individual gives no indication of being aware of the disconnectedness or illogicality of their thinking.</p>                                                                                                         |
| <b>MB25.03</b> | <p>Incoherence</p> <p>Speech or thinking that is so disorganised that it is essentially incomprehensible to others.</p>                                                                                                                                                                                                                                                                                                                                     |
| <b>MB25.0Y</b> | Other specified symptoms and signs of thought disorder                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>MB25.0Z</b> | Symptoms and signs of thought disorder, unspecified                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>MB25.1</b>  | <p><b>Flight of ideas</b></p> <p>A nearly continuous flow of thoughts, usually manifested in speech, with rapid changes from topic to topic that are often based on understandable associations, distracting stimuli, or plays on words. In severe cases, the changes may be so rapid that speech is disorganised and incoherent.</p>                                                                                                                       |
| <b>MB25.2</b>  | <p><b>Neologisms</b></p> <p>The invention of new words that have meaning only to the person using them. May also include the use of existing words in ways that are inconsistent with their common meaning.</p>                                                                                                                                                                                                                                             |
| <b>MB25.3</b>  | <p><b>Thought blocking</b></p> <p>A phenomenon usually manifested by the person's speech being suddenly interrupted by silences, experienced as a quick and total emptying of the mind.</p>                                                                                                                                                                                                                                                                 |
| <b>MB25.Y</b>  | <b>Other specified symptoms and signs of form of thought</b>                                                                                                                                                                                                                                                                                                                                                                                                |

|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB27.0</b>  | <b>Depersonalisation</b><br>Experiencing the self as strange or unreal, or feeling detached from, or as though one were an outside observer of, one's thoughts, feelings, sensations, body, or actions. Depersonalization may take the form of emotional and/or physical numbing, a sense of watching oneself from a distance or 'being in a play', or perceptual alterations (e.g., a distorted sense of time). |
| <b>MB27.1</b>  | <b>Derealisation</b><br>Experiencing other persons, objects, or the world as strange or unreal (e.g., dreamlike, distant, foggy, lifeless, colourless, or visually distorted) or feeling detached from one's surroundings.                                                                                                                                                                                       |
| <b>MB27.2</b>  | <b>Hallucinations</b><br>Sensory perceptions of any modality occurring in the absence of the appropriate (external) stimulus. The person may or may not have insight into the unreal nature of the perception.                                                                                                                                                                                                   |
| <b>MB27.20</b> | Auditory hallucinations<br>Hallucinations involving the perception of sound, most frequently of voices but sometimes of clicks or other noises, that are not restricted to the period of awakening or the onset of sleep.                                                                                                                                                                                        |
| <b>MB27.21</b> | Gustatory hallucinations<br>Hallucinations of taste in the absence of an actual external stimulus.                                                                                                                                                                                                                                                                                                               |
| <b>MB27.22</b> | Hypnopompic hallucinations<br>Hallucinations that occur during the period of awakening, most commonly of the visual, tactile or auditory modality.                                                                                                                                                                                                                                                               |
| <b>MB27.23</b> | Hypnagogic hallucinations<br>Hallucinations that occur at the onset of sleep, most commonly of the visual, tactile or auditory modality.                                                                                                                                                                                                                                                                         |
| <b>MB27.24</b> | Olfactory hallucinations<br>Hallucinations involving the perception of odour (e.g., of burning rubber, decaying fish, orange peel) in the absence of an actual external stimulus.                                                                                                                                                                                                                                |
| <b>MB27.25</b> | Somatic hallucinations<br>Hallucinations involving the perception of an unusual physical state or event within the body, such as an electrical impulse running down one's arms or an object inside one's chest.                                                                                                                                                                                                  |
| <b>MB27.26</b> | Tactile hallucinations<br>Hallucinations involving the perception of being touched (e.g., feeling like bugs are crawling on the skin, pins being stuck into one's finger) that are not restricted to the period of awakening or the onset of sleep.                                                                                                                                                              |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Symptoms, signs or clinical findings of the nervous system (MB40-MB9Y)

Symptoms or signs involving the nervous system (MB40-MB6Y)

**Coded Elsewhere:** Fear of neurological disease (MG24.9)

Symptom or complaint of a body part (ME86)

Age-associated cognitive decline (MB21.0)

Speech disturbances (MA80)

Types of seizures (8A68)

Fear of cancer of neurological system (MG24.0Y)

### **MB40**

#### **Sensation disturbance**

**MB40.0 Asomatognosia**

**MB40.1 Allodynia**

Pain due to a normally non-painful stimulus

**MB40.2 Anacusis**

**MB40.3 Anaesthesia of skin**

Partial or complete loss of sensation affecting the skin, most commonly affecting a circumscribed area and resulting from sensory nerve damage as from injury or leprosy.

**Inclusions:** Numbness of skin

**MB40.4 Tingling fingers or feet or toes**

**MB40.5 Hyperaesthesia**

Increased sensibility to stimuli of sense

**MB40.6 Dysesthesia**

**MB40.7 Acroparaesthesia**

Severe pain in the extremities

**MB40.8 Analgesia**

**MB40.9 Neurological neglect syndrome**

**MB40.Y Other specified sensation disturbance**

**MB40.Z Sensation disturbance, unspecified**

### **MB41**

#### **Disturbances of smell and taste**

Disturbances of smell and taste include anosmia, parosmia, parageusia, and other disturbances of smell and taste.

**MB41.0 Anosmia**

**MB41.1 Parosmia**

**MB45****Lack of coordination**

Other lack of coordination is a lack of coordination other than abnormal involuntary movements and abnormalities of gait and mobility.

**Exclusions:** Vertigo (MB48.0)  
Hereditary ataxia (8A03.1)  
Ataxic gait (MB44.0)

**MB45.0 Ataxia, unspecified**

**MB45.1 Automatism**

Repetitive unconscious gestures such as lip smacking, chewing or swallowing

**MB45.2 Atonia**

Loss of muscle tone

**MB45.3 Head drop**

**MB45.4 Intention tremor**

Cerebellar tremor characterised by a broad course and low frequency

**MB45.Y Other specified lack of coordination**

**MB45.Z Lack of coordination, unspecified**

**MB46****Abnormal involuntary movements**

Abnormal involuntary movements include abnormal head movements, tremor, cramp, spasm, fasciculation, and other abnormal involuntary movements

**Exclusions:** Movement disorders (8A00-8A0Z)  
Stereotyped movement disorder (6A06)  
Tic disorders (8A05)  
Essential tremor or related tremors (8A04.1)  
Intention tremor (MB45.4)

**Coded Elsewhere:** Tremor due to certain specified central nervous system diseases (8A04.33)

**MB46.0 Asterixis**

**MB46.1 Abnormal head movements**

**MB46.2 Athetosis**

Twisting and writhing movements

**MB46.3 Drop attack**

A sudden spontaneous fall while standing and recovery within seconds or minutes

**MB46.4 Titubation**

Head tremor of cerebellar origin

**MB46.5 Shuddering**

|                | Central vertigo is usually a result of an abnormal processing of the vestibular sensory input by the central nervous system due to either a disruption of central integrators (i.e. brain stem, cerebellum) or a sensory information mismatch (i.e. from the cortex). Lesions that affect the vestibular nerve or root entry zone (i.e. cerebellopontine angle [CPA] lesions) result in imbalance by affecting primary vestibular sensory information |

## Paralytic symptoms (MB50-MB5Z)

**Coding Note:** For primary coding, the following categories are to be used only when the relevant paralytic syndrome (complete) (incomplete) is reported without further specification, or is stated to be old or longstanding but of unspecified cause.

|               |                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MB50</b>   | <b>Tetraplegia</b><br><b>Coding Note:</b> Code also the causing condition<br><b>Inclusions:</b> Quadriplegia                                                                              |
| <b>MB50.0</b> | <b>Flaccid tetraplegia</b><br>This is a severe or complete loss of motor function in all four limbs with limp and relaxed muscles.<br><b>Coding Note:</b> Code also the causing condition |
| <b>MB50.1</b> | <b>Spastic tetraplegia</b><br>This is a severe or complete loss of motor function in all four limbs with involuntary contractions.<br><b>Coding Note:</b> Code also the causing condition |

**MB50.Z      Tetraplegia, unspecified**

**Coding Note:** Code also the causing condition

**MB51      Diplegia of upper extremities**

This is a loss of motor control in both arms.

**Coding Note:** Code also the causing condition

**Inclusions:**            paralysis of both upper limbs  
Paralysis of both arms

**MB51.0      Flaccid diplegia of upper extremities**

**MB51.1      Spastic diplegia of upper extremities**

**MB51.Z      Diplegia of upper extremities, unspecified**

**Coding Note:** Code also the causing condition

**MB52      Diplegia of lower extremities**

**Coding Note:** Code also the causing condition

**MB53      Hemiplegia**

This is a severe or complete loss of motor function on one side of the body.

**Coding Note:** Code also the causing condition

**Exclusions:**            congenital cerebral palsy (8D20-8D2Z)  
spastic hemiplegic cerebral palsy (8D20.0)

**MB53.0      Alternating hemiplegia**

**Coding Note:** Code also the causing condition

**MB53.1      Flaccid hemiplegia**

This is a severe or complete loss of motor function on one side of the body with limp and relaxed muscles.

**Coding Note:** Code also the causing condition

**MB53.2      Spastic hemiplegia**

This is a severe or complete loss of motor function on one side of the body with involuntary contractions.

**Coding Note:** Code also the causing condition

**MB53.Z      Hemiplegia, unspecified**

**Coding Note:** Code also the causing condition

**MB54      Monoplegia of upper extremity**

This is a loss of motor control in one arm.

**Coding Note:** Code also the causing condition

**Inclusions:**            paralysis of upper limb  
Paralysis of arm

**MB70****Clinical findings in cerebrospinal fluid****MB70.0****Abnormal level of enzymes in cerebrospinal fluid****MB70.1****Abnormal level of hormones in cerebrospinal fluid****MB70.2****Abnormal level of drugs, medicaments and biological substances in cerebrospinal fluid****MB70.3****Abnormal level of substances chiefly nonmedicinal as to source in cerebrospinal fluid****MB70.4****Abnormal immunological findings in cerebrospinal fluid****MB70.5****Abnormal microbiological findings in cerebrospinal fluid****MB70.6****Abnormal cytological findings in cerebrospinal fluid****MB70.7****Abnormal histological findings in cerebrospinal fluid****MB70.8****Other abnormal findings in cerebrospinal fluid****MB70.Y****Other specified clinical findings in cerebrospinal fluid****MB70.Z****Clinical findings in cerebrospinal fluid, unspecified****MB71****Clinical findings on diagnostic imaging of central nervous system**

Clinical findings on diagnostic imaging of central nervous system is findings on diagnostic imaging of the brain or the spinal cord which don't appear in normal status of the body. Diagnostic imaging refers to technologies that doctors use to look inside body for clues about a medical condition. X-rays, CT scans, nuclear medicine scans, MRI scans and ultrasound are all types of diagnostic imaging.

|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MC20.0</b> | <b>Staphyloma</b><br>This is an abnormal protrusion of the uveal tissue through a weak point in the eyeball. The protrusion is generally black in colour, due to the inner layers of the eye. It occurs due to weakening of outer layer of eye (cornea or sclera) by an inflammatory or degenerative condition. It may be of 5 types, depending on the location on the eye ball (bulbus oculi). |
| <b>MC20.1</b> | <b>Small drusen of the macula</b>                                                                                                                                                                                                                                                                                                                                                               |
| <b>MC20.2</b> | <b>Hypopyon</b><br>Hypopyon is inflammatory cells in the anterior chamber of eye. It is a leukocytic exudate, seen in the anterior chamber, usually accompanied by redness of the conjunctiva and the underlying episclera. It is a sign of inflammation of the anterior uvea and iris, i.e. iritis, which is a form of anterior uveitis. The exudate settles at the bottom due to gravity.     |

| <b>MC41</b> | <b>Tinnitus</b><br>A nonspecific symptom of hearing disorder characterised by the sensation of buzzing, ringing, clicking, pulsations, and other noises in the ear in the absence of appropriate corresponding external stimuli and in the absence of what the examiner can hear with a stethoscope. |
| <b>MC4Y</b> | <b>Other specified symptoms or signs involving the ear or mastoid process</b>                                                                                                                                                                                                                        |

---

**MC6Y****Other specified symptoms, signs or clinical findings of ear or mastoid process****Symptoms, signs or clinical findings of the circulatory system (MC80-MC9Y)**

Symptoms or signs involving the circulatory system (MC80-MC8Y)

**Coded Elsewhere:** Ankle oedema (MG29.00)

Fear of cardiovascular disease (MG24.7)

Fear of heart disease (MG24.5)

Fear of hypertension (MG24.6)

**MC80****Abnormal blood-pressure reading, without diagnosis**

Abnormal blood-pressure reading, without diagnosis is a reading of blood pressure which is higher than normal blood pressure or lower than normal blood pressure, without diagnosis.

**MC80.0****Elevated blood-pressure reading, without diagnosis of hypertension****Coding Note:**

This category is to be used to record an episode of elevated blood pressure in a patient in whom no formal diagnosis of hypertension has been made, or as an isolated incidental finding.

**MC80.00**

White coat hypertension

Persistently elevated office blood pressure readings with persistently normal out-of-the-office readings.

**MC80.01**

Combined diastolic and systolic elevated blood pressure reading without diagnosis of hypertension

**MC80.02**

Diastolic elevated blood pressure reading without diagnosis of hypertension

**MC80.03**

Systolic elevated blood pressure reading without diagnosis of hypertension

**MC80.0Y**

Other specified elevated blood-pressure reading, without diagnosis of hypertension

**Coding Note:**

This category is to be used to record an episode of elevated blood pressure in a patient in whom no formal diagnosis of hypertension has been made, or as an isolated incidental finding.

**MC80.0Z**

Elevated blood-pressure reading, without diagnosis of hypertension, unspecified

**Coding Note:**

This category is to be used to record an episode of elevated blood pressure in a patient in whom no formal diagnosis of hypertension has been made, or as an isolated incidental finding.

**MC80.1****Nonspecific low blood-pressure reading****Exclusions:**

Maternal hypotension syndrome (JA65.6)

Orthostatic hypotension (BA21)

**MC80.Y****Other specified abnormal blood-pressure reading, without diagnosis**

## Symptoms, signs or clinical findings of the respiratory system (MD10-MD6Y)

Symptoms or signs involving the respiratory system (MD10-MD3Y)

**Coded Elsewhere:** Fear of respiratory disease (MG24.A)

Acute life threatening episode (MG44.Y)

### MD10

#### Abnormal sputum

This category includes the abnormalities of quantity, colour and odor in sputum which may suggest an aetiology. Patients with chronic bronchitis typically expectorate small quantities of mucoid yellow material. A foul or fetid odor should suggest infection from anaerobic organisms, usually in cases of lung abscess. Occasionally, greatly excessive amounts of sputum or "bronchorrhoea" is associated with bronchioloalveolar carcinoma.

**Exclusions:** blood-stained sputum (MD22)

### MD11

#### Abnormalities of breathing

Abnormalities of breathing includes dyspnoea, stridor, wheezing, periodic breathing, hyperventilation, mouth breathing, hiccough, sneezing, and other abnormalities of breathing.

**Exclusions:** Respiratory distress of newborn (KB23)  
Respiratory failure of newborn (KB2D)  
Respiratory arrest (MD33)  
Adult acute respiratory distress syndrome (CB00)

#### MD11.0

##### Apnoea

**Exclusions:** Apnoea of newborn (KB2A)  
Sleep-related breathing disorders (7A40-7A4Z)

#### MD11.1

##### Asphyxia

Asphyxia is a life-threatening condition in which oxygen is prevented from reaching the tissues by obstruction of or damage to any part of the respiratory system. More generally the term indicates all the conditions generating impaired or impeded breathing.

**Exclusions:** asphyxia due to foreign body in respiratory tract (ND72)  
asphyxia due to carbon monoxide (NE61)  
asphyxia due to traumatic (Chapter 22)

**Coded Elsewhere:** Intrauterine hypoxia (KB20)  
Birth asphyxia (KB21)

#### MD11.2

##### Ataxic breathing

An irregular breathing pattern that usually progresses to complete apnoea.

#### MD11.3

##### Breath holding

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MD11.4</b>  | <p><b>Sleep related Cheyne-Stokes respiration</b></p> <p>Periodic breathing, a variant of Cheyne-Stokes respiration, is characterised by regular, recurrent cycles of changing tidal volumes in which the lowest tidal volume is less than half the maximal tidal volume in that cycle. It is the most frequent abnormal respiratory pattern directly related to stroke rather than underlying systemic disease, occurring in approximately 25 percent of patients. Periodic breathing may be more common among patients with subarachnoid haemorrhage.</p> <p><b>Exclusions:</b> Central sleep apnea with Cheyne-Stokes breathing (7A40.3)</p> |
| <b>MD11.5</b>  | <p><b>Dyspnoea</b></p> <p>Dyspnoea is used to describe perceptions of difficulty or distress related to breathing and is recognised as symptomatic of disease when it occurs under inappropriate circumstances. Dyspnoea is a presenting complaint of patients with a wide variety of medical diseases by multiple mechanisms.</p> <p>Dyspnoea is considered acute when it lasts from hours up to 3 weeks, subacute from 3 weeks up to 8 weeks, and chronic dyspnoea lasts more than 8 weeks.</p> <p><b>Exclusions:</b> Transient tachypnoea of newborn (KB23.1)</p>                                                                            |
| <b>MD11.6</b>  | <p><b>Hiccough</b></p> <p>Hiccough are repeated involuntary spasms of the diaphragm followed by sudden closure of the glottis, which checks the inflow of air and causes the characteristic sound. Transient episodes are very common. Persistent (&gt; 2 days) and intractable (&gt; 1 mo) Hiccough are uncommon but quite distressing.</p>                                                                                                                                                                                                                                                                                                    |
| <b>MD11.7</b>  | <p><b>Hyperventilation</b></p> <p>Hyperventilation refers to an increase in the rate of alveolar ventilation that is excessive for the rate of metabolic carbon dioxide production, resulting in a decrease in arterial PCO<sub>2</sub> to below the normal range of 37 to 43 mm Hg. Hyperventilation should be distinguished from tachypnoea, an increase in respiratory frequency, and from hyperpnea, an increase in minute volume of ventilation.</p>                                                                                                                                                                                       |
| <b>MD11.8</b>  | <p><b>Mouth breathing</b></p> <p>Breathing through mouth. Nasal obstruction may also necessitate mouth breathing, which itself can precipitate obstructive apnoea. Breathing through the mouth may also increase risk for OSA by its effect on the tongue. The tongue forms the anterior wall of the oropharynx; both the supine posture and opening of the mouth tend to displace it posteriorly and encourage airway closure.</p> <p><b>Exclusions:</b> Dry mouth (DA02.1)</p>                                                                                                                                                                |
| <b>MD11.80</b> | <p><b>Stertor</b></p> <p>Stertor is a heavy snoring or gasping sound on inspiration occurring in coma or deep sleep that may be caused by partial obstruction of airway, choanal stenosis, enlarged tonsils and/or adenoids, and redundant upper airway tissues.</p>                                                                                                                                                                                                                                                                                                                                                                            |
| <b>MD11.8Y</b> | Other specified mouth breathing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>MD11.A</b> | <b>Sneezing</b>                                   | Sneezing is one of the most fundamental airway reflexes, which is characterised by a deep preparatory inspiration followed by an abrupt increase in subglottic pressure reflecting a forceful, active expiration rather similar to coughing. Chemical or physical stimuli to the nasal mucosa may initiate potent respiratory and cardiovascular reflexes via stimulation of trigeminal nerves. Mild stimuli result in sneezing and nasal hypersecretion. These reflex responses protect the lower airways from inhalation of physical and chemical irritants. |
| <b>MD11.B</b> | <b>Stridor</b>                                    | Stridor or a low-pitched, focal inspiratory wheeze usually heard over the neck is a manifestation of upper airway obstruction and should result in an expedited evaluation of the patient as it can precede complete upper airway obstruction and respiratory failure.<br><br><b>Exclusions:</b> laryngismus (stridulus) (CA0H.4)<br>congenital laryngeal stridor (KB20-KB2Z)                                                                                                                                                                                  |
| <b>MD11.C</b> | <b>Wheezing</b>                                   | Continuous adventitious sounds that are high-pitched are called wheezes. Wheezes originate in airways narrowed by spasm, thickening of the mucosa, or luminal obstruction.                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>MD12</b>   | <b>Cough</b>                                      | Cough is an important natural defensive mechanism and protective reflex for clearing the upper and lower airways of excessive secretions such as mucus and inhaled particles. Cough is a common symptom of most respiratory disorders and may be indicative of trivial to very serious airway or lung pathology.<br><br><b>Exclusions:</b> cough with haemorrhage (MD22)                                                                                                                                                                                       |

## Haemorrhage from respiratory passages (MD20-MD2Z)

Haemorrhage from respiratory passages is the bleeding from upper respiratory tract or lower respiratory tract. The major passages and structures of the upper respiratory tract include the nose or nostrils, nasal cavity, mouth, pharynx, and larynx. The major passages and structures of the lower respiratory tract include the trachea and within the lungs, the bronchi, bronchioles, and alveoli.

**Exclusions:** Pulmonary haemorrhage originating in the perinatal period (KB28)

**MD21****Haemorrhage from throat**

Haemorrhage from throat is the bleeding from throat. Throat is a tube that carries food to oesophagus and air to windpipe and larynx.

**Exclusions:** Haemoptysis (MD22)

**MD22****Haemoptysis**

Expectoration or spitting of blood originating from any part of the respiratory tract, usually from haemorrhage in the lung parenchyma and the bronchial arteries.

**Inclusions:** Blood-stained sputum  
Cough with haemorrhage

**MD23****Haemorrhage from other sites in respiratory passages**

**Exclusions:** Pulmonary haemorrhage originating in the perinatal period (KB28)

**Coded Elsewhere:** Neonatal haemorrhage originating in trachea or pulmonary parenchyma (KA83.7)

**MD24****Acute idiopathic pulmonary haemorrhage in infants over 28 days of age**

**Exclusions:** Von Willebrand disease (3B12)

**MD2Z****Haemorrhage from respiratory passages, unspecified****MD30****Pain in throat or chest**

Pain in throat and chest means having pain sensation in throat or chest. Throat is a tube that carries food to oesophagus and air to windpipe and larynx. The technical name for throat is pharynx.

**Exclusions:** Cervical spine pain (ME84.0)  
acute sore throat NOS (CA02)  
pain in breast (GB23.5)  
Epidemic myalgia (1D83)  
Dysphagia (MD93)  
Chronic primary chest pain syndrome (MG30.00)  
Chronic primary visceral pain (MG30.00)  
Chronic secondary visceral pain (MG30.4)

**Coded Elsewhere:** Pain in throat (MD36.0)  
Precordial pain (MC86)  
Musculoskeletal chest pain (ME81)

| <b>MD41</b>    | <b>Clinical findings on diagnostic imaging of lung</b><br>Clinical findings on diagnostic imaging of lung is findings on diagnostic imaging of the lung which don't appear in normal status of the body. Diagnostic imaging refers to technologies that doctors use to look inside body for clues about a medical condition. X-rays, CT scans, nuclear medicine scans, MRI scans and ultrasound are all types of diagnostic imaging. |
| <b>MD42</b>    | <b>Results of function studies of the respiratory system</b>                                                                                                                                                                                                                                                                                                                                                                         |

## Symptoms, signs or clinical findings of the digestive system or abdomen (MD80-ME4Y)

Symptoms or signs involving the digestive system or abdomen (MD80-ME1Y)

- Exclusions:**
- pylorospasm congenital or infantile (LB13.0)
  - Intestinal obstruction of newborn (KB87)
  - gastrointestinal haemorrhage newborn (KA83.1)
  - Symptoms, signs or clinical findings involving the male genital system (MF40-MF4Y)
  - Symptoms, signs or clinical findings involving the urinary system (MF50-MF5Y)
  - Symptoms, signs or clinical findings involving the female genital system (MF30-MF3Y)

**Coded Elsewhere:** Fear of digestive disease (MG24.3)

### **MD80** Symptoms or signs of the orofacial complex

**MD80.0** Symptom or complaint of the teeth or gum

**MD80.1** Symptom or complaint of the mouth, tongue or lip

**MD80.Y** Other specified symptoms or signs of the orofacial complex

### **MD81** Abdominal or pelvic pain

Pain, an unpleasant distress sensation occurring in varying degrees of severity, received by nerve ending in the abdominal and pelvic region.

- Exclusions:**
- Spinal pain (ME84)
  - Flatulence and related conditions (ME08)
  - renal colic (MF56)
  - Chronic primary visceral pain (MG30.00)
  - Chronic secondary visceral pain (MG30.4)

**MD81.0** Abdominal tenderness

**MD81.1** Localised abdominal pain

- Exclusions:**
- Chronic primary visceral pain (MG30.00)
  - Chronic secondary visceral pain (MG30.4)

**MD81.10** Pain localised to upper abdomen  
Pain, an unpleasant distress sensation, which is localised to upper part of abdomen.

- Inclusions:**
- Epigastric pain
- Exclusions:**
- Functional dyspepsia (DD90.3)
  - Chronic primary visceral pain (MG30.00)
  - Chronic secondary visceral pain (MG30.4)

| <b>MD94</b>   | <b>Halitosis</b> <p>Halitosis is an oral health condition in which one's mouth emits a foul odour. There are many causes of halitosis such as poor oral hygiene, tobacco and/or alcohol, and possibly a medical condition such as respiratory and digestive tract disorders.</p>                                                                                                                                                                                                                                                                          |

**MD95****Heartburn**

Substernal pain or burning sensation, usually associated with regurgitation of gastric juice into the oesophagus.

**Exclusions:** Functional dyspepsia (DD90.3)  
Pain in throat or chest (MD30)  
Functional heartburn (DD90.2)

**MD9Y****Other specified symptoms related to the upper gastrointestinal tract**

Symptoms related to the lower gastrointestinal tract or abdomen (ME00-ME0Y)

**Exclusions:** Abdominal or pelvic pain (MD81)

**Coded Elsewhere:** Haematochezia (ME24.A3)  
Haemorrhage of anus and rectum (ME24.A1)  
Meconium ileus without perforation (KB87.2)  
Melaena (ME24.A4)

**ME00****Abdominal compartment syndrome**

Abdominal compartment syndrome is a condition of organ dysfunction caused by increased intra-abdominal pressure (intra-abdominal hypertension), possibly due to intra-abdominal haemorrhage, retroperitoneal haematoma, or intestinal oedema, often occurred after surgical intervention or trauma, or often associated with septic condition. The importance of this clinical entity was recognised recently in the end of the 20th Century. Usually the abdominal distension due to primary ischaemic bowel injury was excluded from this clinical entity.

**ME01****Abdominal distension**

This is a condition in which the abdomen feels full and tight because of swelling of the abdomen, usually due to an increased amount of intestinal gas, but occurs sometimes when fluid, substances or mass are accumulating or expanding in the abdomen.

**ME02****Abdominal rigidity**

Abdominal rigidity is stiffness of the muscles in the belly area, which can be felt when touched or pressed.

**Exclusions:** that with severe abdominal pain (MD81.3)

**ME03****Abnormal bowel sounds**

Bowel sounds are caused by the products of digestion as they move through the lower gastrointestinal tract, usually heard on auscultation. Abnormal bowel sounds are reduced or increased bowel sounds which provide valuable information about the disorders of bowel movement.

**ME03.0****Hyperactive bowel sounds****ME03.1****Absent bowel sounds****ME03.Z****Abnormal bowel sounds, unspecified**

**ME22****Clinical findings on diagnostic imaging of digestive tract****ME23****Results of function studies of the digestive system****ME24****Clinical manifestations of the digestive system**

**Coding Note:** Code also the causing condition

**ME24.0****Digestive system abscess**

This is a clinical form of sign indicating the presence of abscess in digestive system. This category will be used for postcoordination codes as complications of underlying illness.

**Coding Note:** Code also the causing condition

**ME24.1****Digestive system fistula**

This is a clinical form of sign indicating the presence of fistula in the digestive tract. This category will be used for postcoordination codes as complications of underlying illness.

**Coding Note:** Code also the causing condition

**ME24.2****Digestive system obstruction**

This is a clinical form of a sign indicating obstruction of digestive tract. This category will be used for postcoordination codes as complications of underlying illness.

**Coding Note:** Code also the causing condition

**ME24.3****Digestive system perforation**

This is a clinical form of sign indicating perforation of digestive tract. This category will be used for postcoordination codes as complications of underlying illness.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Prenatal gastric perforation (KB82)  
 Postnatal gastric perforation (KB83)  
 Postnatal intestinal perforation (KB86)  
 Prenatal intrauterine intestinal perforation (KB85)

**ME24.30****Perforation of small intestine**

Small intestinal perforation is a complete penetration of the wall of small intestine, often resulting in the leakage of small intestinal contents into the abdominal cavity.

**Exclusions:** Primary ulcer of small intestine (DA94.0)  
 Diverticulitis of small intestine (DC70)  
 perforation due to Crohn disease (DD70.1)  
 perforation due to obstruction (DA91)  
 perforation due to malignant neoplasm ( )

**Coded Elsewhere:** Postnatal isolated ileal perforation (KB84)  
 Injury of small intestine (NB91.7)  
 Laceration of small intestine (NB91.71)

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Symptoms, signs or clinical findings involving the skin (ME60-ME6Y)

Symptoms or signs involving the skin (ME60-ME6Y)

This category allows the capture of imprecise data where a more specific diagnosis cannot be made or to supplement information about a specific diagnosis.

|               |                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ME60</b>   | <p><b>Skin lesion of uncertain or unspecified nature</b></p> <p>To be used where there is either significant uncertainty or alternatively no information as to the nature of a circumscribed skin lesion. This is of particular importance with regard to whether or not the lesion may be malignant.</p> |
| <b>ME60.0</b> | <p><b>Skin lesion of uncertain nature</b></p> <p>This denotes the presence of a skin lesion but uncertainty as to its nature. No inference as to whether the lesion might be of serious significance (e.g. suspected skin cancer) is made.</p>                                                            |
| <b>ME60.1</b> | <p><b>Pigmented skin lesion of uncertain nature</b></p> <p>This denotes the presence of a pigmented skin lesion but uncertainty as to its nature. No inference as to whether the lesion might be of serious significance (e.g. suspected skin cancer) is made.</p>                                        |
| <b>ME60.2</b> | <p><b>Ulcer of skin of uncertain nature</b></p> <p>This denotes the presence of a skin ulcer but uncertainty as to its nature. No inference as to whether the ulcer might be of serious significance (e.g. suspected skin cancer) is made.</p>                                                            |

**ME60.3**                    **Keratosis of skin of uncertain or unspecified nature**

**ME60.Z**                    **Skin lesion of unspecified nature**

**ME61**                    **Subcutaneous swelling, mass or lump of uncertain or unspecified nature**

One or more localised subcutaneous soft tissue masses of undetermined or unspecified nature

**Exclusions:**            localized adiposity (5B80.1)  
                         mass and lump: breast (MF30)  
                         enlarged lymph nodes (MA01)  
                         mass and lump: intra-abdominal or pelvic (MD82)  
                         oedema (MG29)  
                         swelling (of): intra-abdominal or pelvic (MD82)  
                         swelling (of): joint (FA36)

**ME62**                    **Acute skin eruption of uncertain or unspecified nature**

A provisional diagnosis for an acute skin eruption of less than six weeks' duration of unknown, uncertain or unspecified nature.

**Exclusions:**            Drug eruptions (EH60-EH6Z)

**ME62.0**                    **Acute erythematous skin eruption**

A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and consists predominantly of diffuse cutaneous erythema. A classical cause is scarlet fever but reactions to other bacterial toxins, drugs and certain foods or acute graft-versus-host disease may present with a similar picture.

**ME62.1**                    **Acute purpuric skin eruption**

A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and consists predominantly of disseminated purpura. Potential causes are numerous and include thrombocytopenia, coagulopathies, vasculitides and sepsis.

**ME62.2**                    **Acute urticarial skin eruption**

A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and consists of urticaria-like papules and plaques. Drugs are a common precipitant.

**ME62.3**                    **Acute maculopapular skin eruption**

A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and consists of multiple macules and papules. Viral infections and drugs are common precipitants.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ME62.4</b> | <p><b>Acute papular skin eruption</b></p> <p>A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and consists of multiple skin papules. A wide variety of infectious and inflammatory skin disorders may present in this way. Examples include guttate psoriasis, lichen planus, pityriasis lichenoides, insect bites, scabies and secondary syphilis.</p>                                                                                                                        |
| <b>ME62.5</b> | <p><b>Acute exudative skin eruption</b></p> <p>A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and in which exudation and crusting are prominent features. Common causes are infected eczema, acute allergic contact dermatitis and impetigo.</p>                                                                                                                                                                                                                             |
| <b>ME62.6</b> | <p><b>Acute blistering skin eruption</b></p> <p>A provisional diagnosis for an acute blistering skin eruption of unknown or uncertain nature. Examples include vesicular dermatitis of the hands and feet (pompholyx), acute phototoxic reactions, especially to contact with plants (phytophotodermatitis), sunburn and immunobullous disorders such as bullous pemphigoid.</p>                                                                                                                                               |
| <b>ME62.7</b> | <p><b>Acute desquamating skin eruption</b></p> <p>A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and in which desquamation (shedding of skin scales) is a prominent feature. This is seen characteristically in the later stages of many acute viral exanthemata but may also be seen in drug reactions and in unstable and erythrodermic psoriasis.</p>                                                                                                                     |
| <b>ME62.8</b> | <p><b>Acute discoid or annular skin eruption</b></p> <p>A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and consists of multiple circular or ring-shaped patches and plaques. Although infection due to dermatophyte infection (tinea or ringworm) can produce this pattern, many other skin disorders may have a discoid or annular configuration: these are frequently misdiagnosed as tinea. Common examples include atopic eczema, nummular dermatitis and psoriasis.</p> |
| <b>ME62.9</b> | <p><b>Acute excoriation of skin</b></p> <p>A provisional diagnosis for a skin eruption of unknown or uncertain nature which arises abruptly and consists of multiple excoriations. In the majority of cases the excoriation is secondary to intense pruritus arising either from an underlying systemic disorder such as cholestatic jaundice or from a pruritic skin disease such as eczema. In some cases, however, psychogenic factors may be responsible.</p>                                                              |
| <b>ME62.Y</b> | <p><b>Other specified acute skin eruption of uncertain or unspecified nature</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ME63</b>   | <p><b>Chronic skin disorder of uncertain or unspecified nature</b></p> <p>A provisional diagnosis for a chronic skin disorder (of at least six weeks' duration) of unknown, uncertain or unspecified nature.</p>                                                                                                                                                                                                                                                                                                               |

- ME63.0      Chronic erythematous skin disorder**  
A provisional diagnosis for a chronic skin disorder of unknown or uncertain nature in which widespread confluent erythema is the predominant feature. Examples include generalised atopic eczema, erythrodermic psoriasis, pityriasis rubra pilaris and Sézary syndrome.
- ME63.1      Chronic urticarial skin disorder**  
A provisional diagnosis for a rash consisting of persistent urticated papules and plaques for which a more precise diagnosis has not been or cannot be made. Diagnoses which should be considered include immunobullous disorders, urticarial vasculitis and drug reactions.
- ME63.2      Chronic papular skin disorder**  
A provisional diagnosis for a chronic skin disorder of unknown, uncertain or unspecified nature and characterised by the presence of multiple skin papules.
- ME63.3      Chronic blistering skin disorder**  
A provisional diagnosis for a chronic blistering skin disorder of unknown or uncertain nature. Examples include chronic vesicular dermatitis of the hands and feet, epidermolysis bullosa and immunobullous disorders such as bullous pemphigoid.
- ME63.4      Chronic scaling or hyperkeratotic skin disorder**  
A provisional diagnosis for a chronic skin disorder of unknown or uncertain nature in which scaling and hyperkeratosis are prominent features. Examples include psoriasis, ichthyoses, small plaque parapsoriasis and mycosis fungoides.
- ME63.5      Chronic lichenified skin disorder**  
A provisional diagnosis for a chronic skin disorder of unknown or uncertain nature in which lichenification is the prominent feature. Examples include chronic eczema, lichen simplex and lichen planus.
- ME63.6      Chronic discoid or annular skin disorder**  
A provisional diagnosis for a chronic skin disorder of unknown or uncertain nature consisting of multiple circular or ring-shaped patches and plaques. Although infection due to dermatophyte infection (tinea or ringworm) can produce this pattern, many other skin disorders may have a discoid or annular configuration: these are frequently misdiagnosed as tinea. Common examples include atopic eczema, nummular dermatitis and psoriasis.
- ME63.7      Chronic excoriation of skin**  
A provisional diagnosis for a chronic skin disorder of unknown or uncertain nature characterised by the presence of multiple excoriations. In some cases the excoriation is secondary to intense pruritus arising either from an underlying systemic disorder such as uraemia or from a pruritic skin disease such as eczema. In many cases, however, psychogenic factors may be responsible.

**ME64****Non-specific cutaneous vascular signs**

Changes perceptible in the skin as a result of alterations in blood composition, blood flow or blood vessel integrity. They may be due to local factors or may indicate underlying disorders such as anaemia, hypovolaemia, fever, hypoxia or defective clotting.

**ME64.0****Erythema**

Redness of skin due to the presence of increased amounts of oxygenated haemoglobin within dilated skin capillaries. It may be due to localised or generalised inflammatory processes but may result from increased cutaneous blood flow following exertion or associated with pyrexia.

**ME64.1****Cyanosis**

A blue-purple discolouration of the skin due to the presence of increased amounts of deoxygenated blood in skin blood vessels.

**Exclusions:** acrocyanosis (EG00)  
cyanotic attacks of newborn (KB2C)

**ME64.2****Pallor**

Paleness of the skin such as may ensue from severe anaemia or from hypovolaemic shock.

**ME64.3****Petechiae**

Petechiae result from focal leakage of blood from dermal capillaries into the adjacent dermal connective tissue. They present as multiple pin-point non-blanching red or purple macules. The many underlying causes range from the innocuous (e.g. coughing or straining) to life-threatening conditions (e.g. meningococcal septicaemia).

**Coded Elsewhere:** Neonatal cutaneous haemorrhage (KA83.8)

**ME64.4****Flushing**

Paroxysmal vasodilatation of skin capillaries.

**ME65****Disturbances of skin sensation of unspecified aetiology**

A group of cutaneous symptoms for which it is frequently impossible to identify a precise cause.

**Coded Elsewhere:** Anaesthesia of skin (MB40.3)  
Tactile hallucinations (MB27.26)

**ME65.0****Burning of skin**

A burning sensation in the skin which usually arises without obvious explanation.

**ME65.1****Itching of skin**

The sensation of itch in the skin. For persistent itch of unknown cause the term "Pruritus of unknown cause" should be used.

**ME65.2****Pain or tenderness of skin**

**Exclusions:** Chronic pain (MG30)

|               |                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ME65.3</b> | <b>Stinging of skin</b><br>An unpleasant sensation such as may be provoked by stinging nettles but which can be set off in some individuals by a wide variety of topical preparations or stimuli which are otherwise well tolerated by most people.                                                                     |
| <b>ME65.4</b> | <b>Tingling of skin</b><br>A prickling sensation in the skin which may result from external factors such as rain falling on the skin or may be due to transient or permanent peripheral nerve damage.                                                                                                                   |
| <b>ME65.Y</b> | <b>Other specified disturbance of skin sensation</b>                                                                                                                                                                                                                                                                    |
| <b>ME66</b>   | <b>Miscellaneous non-specific skin-related symptoms and signs</b><br>Other specified skin changes which cannot be more precisely defined.<br><i><b>Coded Elsewhere:</b></i> Abnormal skin pigmentation (ED64)                                                                                                           |
| <b>ME66.0</b> | <b>Abnormal sensitivity to light or UV radiation of uncertain or unspecified nature</b><br><i><b>Inclusions:</b></i> Photosensitivity                                                                                                                                                                                   |
| <b>ME66.1</b> | <b>Changes in skin texture</b><br>Alterations in skin texture of unspecified cause.                                                                                                                                                                                                                                     |
| <b>ME66.2</b> | <b>Excess and redundant skin</b><br>A condition which typically occurs in formerly grossly obese individuals following massive weight loss, as following bariatric surgery or severe calorie restriction.                                                                                                               |
| <b>ME66.3</b> | <b>Symptom or complaint relating to hair or scalp</b><br>A very non-specific term to indicate an actual or perceived problem affecting the hair or the scalp which cannot be more precisely coded elsewhere.                                                                                                            |
| <b>ME66.4</b> | <b>Symptom or complaint relating to nails</b><br>A very non-specific term to indicate an actual or perceived problem affecting the finger- or toenails which cannot be more precisely coded elsewhere.                                                                                                                  |
| <b>ME66.5</b> | <b>Complaint of abnormal sweating</b><br>Complaint that sweating is abnormal (most commonly that it is increased) without sufficient evidence to make a specific diagnosis.                                                                                                                                             |
| <b>ME66.6</b> | <b>Rash</b><br>A non-specific term indicating the presence of an acquired skin disturbance to be used only when no more precise information is available.<br><i><b>Exclusions:</b></i> Acute skin eruption of uncertain or unspecified nature (ME62)<br>Chronic skin disorder of uncertain or unspecified nature (ME63) |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**ME85****Stiffness of joint**

Lack of range of motion of a joint secondary to pain, disease process or congenital malformation not detailed in or used in conjunction with other codes.

**ME86****Symptom or complaint of a body part****ME86.0****Symptom or complaint of the ankle**

**Exclusions:** Chronic primary musculoskeletal pain (MG30.02)  
Chronic secondary musculoskeletal pain (MG30.3)

**ME86.1****Symptom or complaint of the arm**

**Exclusions:** Chronic primary musculoskeletal pain (MG30.02)  
Chronic secondary musculoskeletal pain (MG30.3)

**ME86.2****Symptom or complaint of the back**

**Exclusions:** Chronic primary musculoskeletal pain (MG30.02)  
Chronic secondary musculoskeletal pain (MG30.3)

**ME86.20****Back syndrome without radiating pain**

**Exclusions:** Spondylolysis (FA81)  
Spondylolisthesis (FA84)  
Atlanto-axial instability or subluxation (LB73.22)  
Subluxation complex (ME93)  
Torticollis (FA71)  
Spinal enthesitis (FA92.00)  
Axial spondyloarthritis (FA92.0)  
Myelopathy (8B42)  
Spondylopathies (FB00-FB0Z)  
Intervertebral disc degeneration (FA80)  
Localised central endplate defect (FA85.10)  
Spinal instabilities (FB10)  
Strain or sprain of lumbar spine (NB53.5)  
Chronic primary musculoskeletal pain (MG30.02)

**ME86.21****Back syndrome with radiating pain**

**Exclusions:** Spondylolysis (FA81)  
Low back pain (ME84.2)  
Sciatica (ME84.3)  
Intervertebral disc degeneration (FA80)  
Chronic primary musculoskeletal pain (MG30.02)

**ME86.22****Symptom or complaint of the low back**

**Exclusions:** Chronic primary musculoskeletal pain (MG30.02)

## Symptoms, signs or clinical findings of the genitourinary system (MF30-MG0Y)

Symptoms, signs or clinical findings involving the female genital system (MF30-MF3Y)

**Coded Elsewhere:** Fear of complications of pregnancy (MG24.D)

Fear of female genital or breast disease (MG24.F)

Fear of sexually transmitted disease female (MG24.E)

Menstrual cycle bleeding disorders (GA20)

Breast engorgement of newborn (KC41.0)

**MF30 Breast lump or mass female**

**MF31 Breast or lactation symptom or complaint**

**MF32 Menopausal symptom or complaint**

**Coded Elsewhere:** Postmenopausal atrophic vaginitis (GA30.2)

Menopausal hot flush (GA30.4)

**MF33 Premenstrual symptom or complaint**

A symptom of premenstrual syndrome affecting females that is idiopathic. This symptom is characterised by cyclic emotional, physical, or behavioural symptoms such as mood alterations, psychological changes, fluid retention, neurologic changes, gastrointestinal changes, pelvic heaviness, or dermatological changes affecting women in the luteal phase of the menstrual cycle that interfere with an individual's lifestyle.

**MF34 Pregnancy symptom or complaint**

**MF35 Postpartum symptom or complaint**

**MF36 Other symptom or complaint of vagina**

**MF37 Symptom or complaint of female nipple**

**MF38 Symptom or complaint of female pelvis**

**MF39 Symptom or complaint of the vulva**

**MF3A Vaginal discharge**

**MF3Y Other specified symptoms, signs or clinical findings involving the female genital system**

Symptoms, signs or clinical findings involving the male genital system (MF40-MF4Y)

**Coded Elsewhere:** Fear of genital disease male (MG24.H)

Fear of sexually transmitted disease male (MG24.G)

Male infertility (GB04)

Fear of sexual dysfunction male (MG24.Y)

## **MF40**

### **Problems of male genital organs**

A group of disorders associated with the male genital organs occurring in diseases more specifically classified elsewhere.

#### **MF40.0 Symptom or complaint of the penis**

##### **MF40.00** Pain in penis

**Exclusions:** Chronic secondary visceral pain (MG30.4)  
Chronic primary visceral pain (MG30.00)

##### **MF40.0Y** Other specified symptom or complaint of the penis

##### **MF40.0Z** Symptom or complaint of the penis, unspecified

#### **MF40.1 Problems of the prostate**

A group of disorders associated with the prostate occurring in diseases more specifically classified elsewhere.

#### **MF40.2 Symptom or complaint of the scrotum or testis**

**Coded Elsewhere:** Pain in scrotum (GB0Y)

##### **MF40.20** Acute scrotal pain

**Exclusions:** Torsion of testis (GB01.0)  
Torsion of epididymis (GB01.1)  
Torsion of hydatids (GB01.2)  
Orchitis (GB02)

##### **MF40.21** Testicular pain

**Exclusions:** Chronic primary visceral pain (MG30.00)  
Chronic secondary visceral pain (MG30.4)

##### **MF40.2Y** Other specified symptom or complaint of the scrotum or testis

##### **MF40.2Z** Symptom or complaint of the scrotum or testis, unspecified

#### **MF40.3 Retrograde ejaculation**

Retrograde Ejaculation is a condition in which semen that is normally ejaculated via the urethra is redirected to the urinary bladder. Retrograde Ejaculation is typically accompanied by subjective orgasm, though the man may notice that release of semen is limited or absent. Retrograde Ejaculation most commonly occurs as a complication of transurethral prostatic resection, but may also be caused by other surgery of the pelvic area, nervous system dysfunction, or use of pharmacological agents. Confirmation is by identification of spermatozoa in a urine sample.

Clinical findings in specimens from the urinary system (MF80-MF8Z)

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MF80</b> | <b>Diffuse mesangial sclerosis</b><br>Diffuse mesangial sclerosis is a histological appearance which is characterised by diffuse thickening of basement membrane and massive enlargement of mesangial areas leading to contraction and sclerosis of the glomerular capillary tuft. It may be seen in children with early onset steroid resistant nephrotic syndrome due to a variety of genetic abnormalities, either as an isolated renal disease or as part of a multi-organ syndrome. |
| <b>MF81</b> | <b>Fibronectin glomerulopathy</b><br>Fibronectin glomerulopathy is a rare hereditary kidney disease in which fibronectin (FN1) deposits are seen in the mesangium and subendothelial space. The clinical picture is characterised by proteinuria, type IV renal tubular acidosis, microscopic haematuria and hypertension that may lead to end-stage renal failure in the second to sixth decade of life. This disease may be associated with mutations in the FN1 gene.                 |
| <b>MF82</b> | <b>Lipoprotein glomerulopathy</b><br>Characteristic lipoprotein thrombi are found in the glomerulus in this genetically determined disease mainly found in East Asia.                                                                                                                                                                                                                                                                                                                    |
| <b>MF83</b> | <b>Diabetic glomerular changes</b><br>Diabetic glomerulosclerosis involves diffuse thickening of the basement membrane progressing to diffuse mesangial expansion (diffuse diabetic glomerulosclerosis) with in some cases matrix occupying the capillary lumen to form Kimmelstiel Wilson nodules (nodular glomerulosclerosis)                                                                                                                                                          |

**Coding Note:** Code also the causing condition

**MF84****Pauci-immune proliferative glomerulonephritis**

A focal and segmental necrotising glomerulonephritis with no immune deposits (“pauci-immune”). Typical of glomerular involvement in anti-neutrophil cytoplasmic antibody (ANCA) mediated vasculitis – microscopic polyangiitis and Wegener's granulomatosis. Most but not all patients have circulation ANCA when there is active disease.

**MF85****Anti-glomerular basement membrane antibody mediated disease**

Anti-GBM mediated glomerulonephritis is an aggressive focal and segmental proliferative glomerular disease characterised by linear staining of the glomerular basement membrane for immunoglobulins, particularly IgG and IgM. Crescentic change is often associated and circulating anti-bodies to glomerular basement membrane are found in active disease. The renal syndrome is often acute nephritis with rapid renal functional decline (rapidly progressive nephritis) and if associated with respiratory involvement (haemoptysis, respiratory failure) the couple is termed “Goodpasture's syndrome”.

**Inclusions:** Goodpasture syndrome

**MF8Y****Other specified clinical findings in specimens from the urinary system****MF8Z****Clinical findings in specimens from the urinary system, unspecified**

Clinical findings on examination of urine, without diagnosis (MF90-MF9Y)

**Coding Note:** This category is to be assigned when no underlying or determining condition is identified.

**Exclusions:** Specific findings indicating disorder of amino-acid metabolism (5C50)  
Specific findings indicating disorder of carbohydrate metabolism (5C51)  
Clinical findings on antenatal screening of mother (JA66)

**MF90****Acetonuria**

Acetonuria is a medical condition in which acetone is present in the urine.

**Inclusions:** Ketonuria

**MF91****Bilirubinuria**

Bilirubinuria means the presence of any bile pigment in the urine.

**MF92****Chyluria**

Chyluria, also called chylous urine, is a medical condition involving the presence of chyle in the urine stream, which results in urine appearing milky white.

**Exclusions:** Filarial chyluria (1F66)

**MF93****Glycosuria**

**Coded Elsewhere:** Renal glycosuria (GB90.45)

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>MF94</b>   | <b>Haemoglobinuria</b><br>The presence of free haemoglobin in the urine, indicating haemolysis of erythrocytes within the vascular system. After saturating the haemoglobin-binding proteins (haptoglobins), free haemoglobin begins to appear in the urine.<br><i><b>Exclusions:</b></i> Marchiafava-Micheli syndrome (3A21.0)                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>MF95</b>   | <b>Myoglobinuria</b><br>Myoglobinuria is the presence of myoglobin in the urine usually as result of rhabdomyolysis. Any process that interferes with the storage or use of energy by muscle cells can lead to myoglobinuria. When excreted into the urine, myoglobin can precipitate, causing tubular obstruction and acute kidney injury. The most common causes of myoglobinuria in adults are trauma, alcohol and drug abuse, usually in relation to muscle necrosis from prolonged immobilization and pressure by the body weight. Prolonged ethanol consumption and seizure activity, similar to excessive physical activity, can produce an imbalance between muscle energy consumption and production, resulting in muscle destruction. |
| <b>MF96</b>   | <b>Proteinuria</b><br>Excessive serum proteins in the urine, such as in renal disease when albumin is the main protein, but also may be due to other proteins such as immunoglobulin light chains in plasma cell dyscrasia such as multiple myeloma.<br><i><b>Exclusions:</b></i> Persistent proteinuria or albuminuria (GB42)<br><i><b>Coded Elsewhere:</b></i> Gestational proteinuria without hypertension (JA22.0)<br>Gestational oedema with proteinuria without hypertension (JA22.2)                                                                                                                                                                                                                                                     |
| <b>MF96.0</b> | <b>Orthostatic proteinuria</b><br>A condition characterised by an elevated protein excretion while in the upright position and normal protein excretion in a supine or recumbent position.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>MF96.1</b> | <b>Bence Jones proteinuria</b><br>A condition characterised by the presence of a monoclonal globulin protein or immunoglobulin light chain (Bence Jones protein) in the urine. Originally detected by precipitating at 56 and dissolving again at 100 degrees centigrade (Henry Bence Jones 1813-1873) they are now detected by urinary electrophoresis or light chain assay.                                                                                                                                                                                                                                                                                                                                                                   |

## General symptoms, signs or clinical findings (MG20-MG9Y)

General symptoms (MG20-MG4Y)

**Coded Elsewhere:** Enlarged lymph nodes (MA01)

Symptom or complaint of a body part (ME86)

### MG20

#### Cachexia

Cachexia is a pathological generalised loss of body mass with reduction of the storage fat deposits, structural fat and musculature that can be accompanied by gradual loss of function of organs.

**Exclusions:**

- Human immunodeficiency virus disease associated with wasting syndrome (1C62.3)
- Malignant neoplasms of ill-defined or unspecified primary sites (2D40-2D4Z)
- nutritional marasmus (5B51)

### MG20.0

#### Malignant cachexia

### MG20.Z

#### Cachexia, unspecified

### MG21

#### Chills

### MG22

#### Fatigue

A feeling of exhaustion, lethargy, or decreased energy, usually experienced as a weakening or depletion of one's physical or mental resource and characterised by a decreased capacity for work and reduced efficiency in responding to stimuli. Fatigue is normal following a period of exertion, mental or physical, but sometimes may occur in the absence of such exertion as a symptom of health conditions.

**Inclusions:** General physical deterioration

Lethargy

**Exclusions:**

- Combat fatigue (QE84)
- Exhaustion due to exposure (NF07.2)
- heat exhaustion (NF01)
- Bodily distress disorder (6C20)
- Depressive disorders (6A70-6A7Z)
- Sleep-wake disorders (Chapter 07)
- Bipolar or related disorders (6A60-6A6Z)
- senile fatigue (MG2A)
- Chronic fatigue syndrome (8E49)
- Myalgic encephalomyelitis (8E49)
- Postviral fatigue syndrome (8E49)
- pregnancy-related exhaustion and fatigue (JA65)

### MG23

#### Fear of death or dying

Pitting of lip

**MG29.0Y**

Other specified localised oedema

**MG29.1****Generalised oedema****MG29.10**

Oedema due to increased capillary pressure

Increased capillary pressure increases the leakage of fluid from the vascular compartment to the interstitial tissues, resulting in oedema. Causes include impaired or obstructed venous return (fluid overload, venous thrombosis, right heart failure, venous compression from tumour tissue), increased blood flow (physiological response to heat exposure, arteriovenous malformations, disturbed cutaneous vasomotor control due to drug or autonomic neuropathy), or reduced plasma oncotic pressure due to hypoproteinaemia.

**Coded Elsewhere:** Fluid overload with oedema (5C78)

**MG29.1Y**

Other specified generalised oedema

**MG29.2****Infectious oedema****MG29.3****Pitting oedema****MG29.Z****Oedema, unspecified**

Pelvic or perineal pain (MD81.11)

Pain in shoulder (ME82)

Spinal pain (ME84)

Pain in tooth, toothache (DA0A)

Renal colic (MF56)

Pain in throat (MD36.0)

Low back pain (ME84.2)

Pain in limb (FB56.4)

Pain disorders (8E43)

**MG30****Chronic pain**

Pain is an unpleasant sensory and emotional experience associated with, or resembling that associated with, actual or potential tissue damage. Chronic pain is pain that persists or recurs for longer than 3 months. Chronic pain is multifactorial: biological, psychological and social factors contribute to the pain syndrome.

**Coding Note:** This code should be used if a pain condition persists or recurs for longer than 3 months.

**Exclusions:** Acute pain (MG31)

**MG30.0****Chronic primary pain**

Chronic primary pain is chronic pain in one or more anatomical regions that is characterised by significant emotional distress (anxiety, anger/frustration or depressed mood) or functional disability (interference in daily life activities and reduced participation in social roles). Chronic primary pain is multifactorial: biological, psychological and social factors contribute to the pain syndrome. The diagnosis is appropriate independently of identified biological or psychological contributors unless another diagnosis would better account for the presenting symptoms.

**Coding Note:**

Other chronic pain diagnoses to be considered are chronic cancer-related pain, chronic postsurgical or posttraumatic pain, chronic neuropathic pain, chronic secondary headache or orofacial pain, chronic secondary visceral pain and chronic secondary musculoskeletal pain.

**Exclusions:** Acute pain (MG31)

**Coded Elsewhere:** Painful bruising syndrome (ED02)

**MG30.00****Chronic primary visceral pain**

Chronic primary visceral pain is chronic pain localized in the thoracic, abdominal or pelvic region, and is associated with significant emotional distress or functional disability. The distinct anatomical location is compatible with typical referral pain patterns from specific internal organs. The symptoms are not better explained by a diagnosis of chronic secondary visceral pain. Chronic primary visceral pain is multifactorial: biological, psychological and social factors contribute to the pain syndrome. The diagnosis is appropriate independently of identified biological or psychological contributors unless another diagnosis would better account for the presenting symptoms.

**Exclusions:** Chronic abdominal pain NOS (MD81.4)

**Coded Elsewhere:** Penoscrotodynia (EC92.0)

Vulvodynia (GA34.02)

Irritable bowel syndrome (DD91.0)

Functional gallbladder disorder (DD94)

Functional sphincter of Oddi disorder (DD95)

Functional abdominal pain in children (DD93.Y)

Functional biliary sphincter of Oddi disorder (DD95)

Functional pancreatic sphincter of Oddi disorder (DD95)

Abdominal pain-related functional GI disorders in children  
(DD93.Y)

Vulval dysaesthesia syndrome (GA34.02)

**MG30.01****Chronic widespread pain**

Chronic widespread pain (CWP) is diffuse pain in at least 4 of 5 body regions and is associated with significant emotional distress (anxiety, anger/frustration or depressed mood) or functional disability (interference in daily life activities and reduced participation in social roles). CWP is multifactorial: biological, psychological and social factors contribute to the pain syndrome. The diagnosis is appropriate when the pain is not directly attributable to a nociceptive process in these regions and there are features consistent with nociplastic pain and identified psychological and social contributors.

**Exclusions:** Acute pain (MG31)

**MG30.02****Chronic primary musculoskeletal pain**

Chronic primary musculoskeletal pain is chronic pain in the muscles, bones, joints or tendons that is characterised by significant emotional distress (anxiety, anger/frustration or depressed mood) or functional disability (interference in daily life activities and reduced participation in social roles). Chronic primary musculoskeletal pain is multifactorial: biological, psychological and social factors contribute to the pain syndrome. The diagnosis is appropriate independently of identified biological or psychological contributors unless another diagnosis would better account for the presenting symptoms. Other chronic musculoskeletal pain diagnoses to be considered are those listed under chronic secondary musculoskeletal pain.

**Exclusions:** Acute pain (MG31)

**MG30.03****Chronic primary headache or orofacial pain**

Chronic primary headache or orofacial pain is defined as headache or orofacial pain that occurs on at least 50% of the days during at least 3 months. It is characterised by significant emotional distress (anxiety, anger/frustration or depressed mood) or functional disability (interference in daily life activities, reduced participation in social roles). Chronic primary headache or orofacial pain is multifactorial: biological, psychological and social factors contribute to the pain syndrome. The diagnosis is appropriate independently of identified biological or psychological contributors unless another diagnosis would better account for the presenting symptoms. The duration of pain per day is at least 2 hours.

**Exclusions:** Headache disorders (8A80-8A8Z)

**Coded Elsewhere:** Chronic migraine (8A80.2)

Burning mouth syndrome (DA0F.0)

Chronic tension-type headache (8A81.2)

Chronic cluster headache (8A82)

Hemicrania continua (8A82)

| <b>MG30.04</b>      | <p>Complex regional pain syndrome</p> <p>Complex regional pain syndrome (CRPS) is a chronic pain condition in an extremity with a variable course over time. It is characterized by continuing regional pain (not in a specific nerve territory or dermatome), usually with distal predominance or distal-to-proximal gradient. It typically arises after tissue trauma and is seemingly disproportionate in magnitude or duration to the usual course of pain after such tissue trauma.</p> <p>CRPS is characterized by signs indicating autonomic and neuro-inflammatory changes in the affected body region varying between patients and over time. Often, CRPS is accompanied by significant emotional distress or functional disability. CRPS is multifactorial.</p> |
| <b>MG30.0Y</b>      | Other specified chronic primary pain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**MG30.11****Chronic post cancer treatment pain**

Chronic post-cancer treatment pain is pain caused by any treatment given to treat the primary tumour or metastases. The most common forms are:

- (i) Chronic painful chemotherapy-induced polyneuropathy (CIPN): chronic peripheral neuropathic pain caused by oral or intravenous chemotherapy.
- (ii) Chronic post-radiotherapy pain: chronic pain caused by delayed local damage to the nervous system in the field of radiotherapy. It is distinct from pain caused by tumour recurrence or co-morbid disease.

Other treatments include surgery and hormonal therapy.

**Diagnostic Criteria**

Conditions A to C are fulfilled:

A. Chronic pain (persistent or recurrent for longer than 3 months) is present and characterised by all of the following:

A1 History of treatment with neurotoxic chemotherapy or radiotherapy or any treatment given to treat the primary tumour or metastases

A2 It is likely that the pain is caused by the cancer treatment.

B. One of the following applies:

B1 An active or recurrent tumour or metastases have been specifically excluded on radiological investigation.

B2 If an active or a recurrent tumor or metastases are present, the pain is not better accounted for by them.

C. The pain is not better accounted for by another diagnosis of chronic pain.

**Coding Note:** Code also the causing condition

**MG30.1Y** Other specified chronic cancer related pain

**Coding Note:** Code also the causing condition

**MG30.1Z** Chronic cancer related pain, unspecified

**Coding Note:** Code also the causing condition

**MG30.2** **Chronic postsurgical or post traumatic pain**

Chronic postsurgical or post traumatic pain is pain developing or increasing in intensity after a surgical procedure or a tissue injury (involving any trauma including burns) and persisting beyond the healing process, i.e. at least 3 months after surgery or tissue trauma. The pain is either localized to the surgical field or area of injury, projected to the innervation territory of a nerve situated in this area, or referred to a dermatome (after surgery/injury to deep somatic or visceral tissues). Other causes of pain including infection, malignancy etc. need to be excluded as well as pain continuing from a pre-existing pain problem.

**Coding Note:** The postsurgical or posttraumatic aetiology of the pain should be highly probable; if it is vague, consider using codes in the section of chronic primary pain.

**Coded Elsewhere:** Complex regional pain syndrome (MG30.04)

The pain is either localised to the surgical field, projected to the innervation territory of a nerve situated in this area, or referred to a dermatome (after surgery/injury to deep somatic or visceral tissues). Other causes of pain including infection, malignancy etc. need to be excluded as well as pain continuing from a pre-existing pain problem. Dependent on type of surgery, chronic postsurgical pain often may be neuropathic pain.</p> <p><b>Coding Note:</b> The postsurgical aetiology of the pain should be highly probable; if it is vague, consider using codes in the section of chronic primary pain.</p>                                                                                                                                                                                                                                                                               |

**MG30.3 Chronic secondary musculoskeletal pain**

Chronic secondary musculoskeletal pain is chronic pain arising from bone(s), joint(s), muscle(s), vertebral column, tendon(s) or related soft tissue(s). It is a heterogeneous group of chronic pain conditions originating in persistent nociception in joint, bone, muscle, vertebral column, tendons and related soft tissues, with local and systemic aetiologies, but also related to deep somatic lesions. The pain may be spontaneous or movement-induced.

**Coding Note:** If the pain is related to visceral lesions, it should be considered whether a diagnosis of chronic visceral pain is appropriate;

if it is related to neuropathic mechanisms, it should be coded under chronic neuropathic pain;

and if the pain mechanisms are non-specific, chronic musculoskeletal pain should be coded under chronic primary pain.

**Exclusions:** Acute pain (MG31)  
Chronic neuropathic pain (MG30.5)  
Chronic primary pain (MG30.0)  
Chronic secondary visceral pain (MG30.4)

**MG30.30 Chronic secondary musculoskeletal pain from persistent inflammation**

Chronic secondary musculoskeletal pain from persistent inflammation is chronic pain due to inflammatory mechanisms in joint(s), bone(s), tendon(s), muscle(s), soft tissue(s) or vertebral column. The pain may be spontaneous or movement-induced. It is characterised by clinical features of inflammation, including increased sensitivity of the part to stimuli.

**Coding Note:** Code also the causing condition

**MG30.31 Chronic secondary musculoskeletal pain associated with structural changes**

Chronic secondary musculoskeletal pain associated with structural changes is chronic pain of unknown mechanism(s) that is attributable to anatomical changes in joint(s), bone(s) or tendon(s). The structural change needs to be inferred from clinical examination and/or demonstrable on imaging. The pain may be spontaneous or movement-induced. It is characterised by clinical features such as swelling, allodynia or restricted movement.

Diagnostic Criteria:

Conditions A to D are fulfilled:

A) Chronic pain (persistent or recurrent for longer than 3 months) in joint(s), bone(s), or tendon(s) is present. The pain may be spontaneous or movement induced.

B) At least one of the following fulfilled:

B1) Swelling is present.

B2) Allodynia over the part is present.

C) The structural change is inferred from clinical examination or imaging.

D) The pain is not better accounted for by another diagnosis of chronic pain.

**Coding Note:** Code also the causing condition

**Coded Elsewhere:** Chronic pain after musculoskeletal injury (MG30.20)

| <b>MG30.62</b>      | <p>Chronic neuropathic orofacial pain</p> <p>Chronic neuropathic orofacial pain is chronic pain in the orofacial region that is caused by a lesion or disease of the peripheral somatosensory nervous system. It occurs for two hours or more per day (or several shorter attacks per day occur) on at least 50% of the days during at least three months. The diagnosis of chronic neuropathic orofacial pain requires a history of peripheral nervous system injury or disease and a neuroanatomically plausible distribution of the pain. Negative and positive sensory symptoms or signs must be compatible with the innervation territory of the affected nervous structure.</p> |

**MG40****Shock**

Shock is a life-threatening medical condition that occurs due to inadequate substrate for aerobic cellular respiration. In the early stages this is generally an inadequate tissue level of oxygen. Shock, not elsewhere classified is a shock that isn't classified elsewhere.

**Exclusions:** Traumatic shock, not elsewhere classified (NF0A.4)  
 Toxic shock syndrome (1C45)  
 lightning shock (NF08.0)  
 electric shock (NF08.4)  
 Psychic shock (QE84)  
 Anaphylactic shock NOS (4A84)  
 Anaphylaxis due to allergic reaction to food (4A84.0)  
 anaphylactic shock due to serum (NE80.3)

**Coded Elsewhere:** Sepsis with septic shock (1G41)  
 Shock following abortion, ectopic or molar pregnancy (JA05.3)  
 Shock during or following labour or delivery (JB0D.1)

**MG40.0****Cardiogenic shock**

**Exclusions:** Cardiogenic shock, unrelated to mechanical complications, as current complication following acute myocardial infarction (BA60.9)

**MG40.1****Hypovolaemic shock**

**Exclusions:** traumatic hypovolemic shock (NF0A.4)

**MG40.Y****Other specified shock****MG40.Z****Shock, unspecified****MG41****Sleep disturbance, not elsewhere classified**

**Exclusions:** Sleep-wake disorders (Chapter 07)

**MG42****Somnolence, not elsewhere classified**

**Inclusions:** Drowsiness

**Exclusions:** Sleep-wake disorders (Chapter 07)

**MG43****Symptoms and signs concerning food and fluid intake**

Symptoms and signs concerning food and fluid intake include anorexia, polydipsia, polyphagia, feeding difficulties and mismanagement, abnormal weight loss, abnormal weight gain, insufficient intake of food and water due to self neglect and other symptoms and signs concerning food and fluid intake.

**Exclusions:** Feeding or eating disorders (6B80-6B8Z)  
 malnutrition (5B50-5B7Z)

**MG45****Syncope and collapse**

Syncope is also called fainting, temporary loss of consciousness. Syncope and collapse is temporary loss of consciousness with a fall down.

**Inclusions:** Fainting

Blackout

**Exclusions:** Heat syncope (NF01.1)

carotid sinus syncope (8D88)

Shock during or following labour or delivery (JB0D.1)

unconsciousness NOS (MB20.1)

Cardiogenic shock (MG40.0)

Shock following abortion, ectopic or molar pregnancy (JA05.3)

shock: NOS (MG40)

Orthostatic hypotension (BA21)

neurogenic orthostatic hypotension (8D87.0)

**Coded Elsewhere:** Reflex syncope (8D89.0)

Syncope due to autonomic failure (8D89.1)

**MG45.0****Cardiac syncope****MG45.Y****Other specified syncope and collapse****MG45.Z****Syncope and collapse, unspecified****MG46****Systemic inflammatory response syndrome of noninfectious origin**

**Coding Note:** Code also the underlying condition.

**Exclusions:** Systemic inflammatory response syndrome of infectious origin  
(Chapter 01)

**MG47****Toxicosis not further specified**

**Exclusions:** Harmful effects of substances (NE60-NE6Z)

**MG48****Unknown and unspecified causes of morbidity**

**Inclusions:** Undiagnosed disease, not specified as to the site or system involved

**MG49****Hangover**

**Exclusions:** Alcohol withdrawal (6C40.4)

**MG4A****Multi organ failure**

Failure of function of more than one organ or organ system, not otherwise specified

**Coding Note:** Code also the causing condition

**MG4Y****Other specified general symptoms**

## Finding of microorganism resistant to antimicrobial drugs (MG50-MG5Z)

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50**

#### **Finding of gram negative bacteria resistant to antimicrobial drugs**

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50.0**

#### **Antibiotic resistant *Acinetobacter baumannii***

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50.00**

#### **Tetracycline resistant *Acinetobacter baumannii***

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50.01**

#### **Aminoglycoside resistant *Acinetobacter baumannii***

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50.02**

#### **Carbapenem resistant *Acinetobacter baumannii***

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50.03**

#### **Polymyxin resistant *Acinetobacter baumannii***

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50.0Y**

#### ***Acinetobacter* resistant to other antibiotic**

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

### **MG50.0Z**

#### ***Acinetobacter* resistant to unspecified antibiotic**

**Coding Note:** These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials.

|               | Sudden unexpected death in epilepsy (SUDEP) is a category of death in people with epilepsy that occurs under benign circumstances and in the absence of known structural causes of death (i.e. not due to drowning, injury, intoxication and other internal or external factors). Evidence of a preceding seizure may be present or not. A "definite SUDEP" is confirmed if a postmortem examination does not reveal an alternative cause of death. If such examination lacks, but potentially lethal alternative causes are excluded and all other criteria are met, the death is labelled as "probable SUDEP". The term "possible SUDEP" is used in cases with competing causes of death or when data are insufficient to reasonably allow their classification. The term "SUDEP plus" applies when a patient also suffered from other diseases that may have contributed to the death, but there are no clues that the alternative condition has truly caused it. Cases in which cardiopulmonary resuscitation prevented the death are called "near-SUDEP". |

## CHAPTER 22

---

### Injury, poisoning or certain other consequences of external causes

This chapter has 236 four-character categories.

Code range starts with NA00

In the ICD, injury means physical or physiological bodily harm resulting from interaction of the body with energy (mechanical, thermal, electrical, chemical or radiant, or due to extreme pressure) in an amount, or at a rate of transfer, that exceeds physical or physiological tolerance. Injury can also result from lack of vital elements, such as oxygen. Poisoning by and toxic effects of substances are included, as is damage of or due to implanted devices.

Injury usually has rapid onset in response to a well-defined event (e.g. a car crash, striking the ground after falling, drinking a strongly alkaline liquid, an overdose of a medication, a burn sustained during a surgical procedure). These events are often referred to as external causes of injury. The injurious energy can, however, originate from the injured person and/or from his or her immediate environment (e.g. a person running on a hot day sustains heat exhaustion), and injury can be caused by the injured person (i.e. intentional self-harm).

Injury includes manifestations that are evident immediately after onset, which may persist or not, and manifestations that first become evident at a later date.

**Exclusions:**

- Stress fracture, not elsewhere classified (FB80.A)
- Pathological fracture (FB80.B)
- Certain specified obstetric trauma (JB0A)
- Malunion of fracture (FB80.7)
- Birth injury (KA40-KA4Z)
- Nonunion of fracture (FB80.8)

This chapter contains the following top level blocks:

- Injuries to the head
- Injuries to the neck
- Injuries to the thorax
- Injuries to the abdomen, lower back, lumbar spine or pelvis
- Injuries to the shoulder or upper arm
- Injuries to the elbow or forearm
- Injuries to the wrist or hand
- Injuries to the hip or thigh
- Injuries to the knee or lower leg
- Injuries to the ankle or foot
- Injuries involving multiple body regions

- Injuries to unspecified part of trunk, limb or body region
- Effects of foreign body entering through natural orifice
- Burns
- Frostbite
- Harmful effects of substances
- Injury or harm arising from surgical or medical care, not elsewhere classified
- Other or unspecified effects of external causes

## Injuries to the head (NA00-NA0Z)

**Coding Note:** This Block includes the following:

- injuries of face [any part]
- injuries of gum
- injuries of jaw
- injuries of oral cavity
- injuries of palate
- injuries of periocular area
- injuries of scalp
- injuries of temporomandibular joint area
- injuries of tongue
- injuries of tooth

**Exclusions:**

- Foreign body in ear (ND71)
- Foreign body in mouth (ND73.0)
- Foreign body in larynx (ND72.3)
- Foreign body in pharynx (ND72.2)
- Foreign body in nostril (ND72.1)
- Burns (ND90-NE2Z)
- Frostbite (NE40-NE4Z)
- Foreign body on external eye (ND70)

**Coded Elsewhere:** Epilepsy due to injuries to the head (8A60.5)  
Birth injury to face (KA43.3)

### NA00

#### Superficial injury of head

Damage inflicted on the surface or shallow tissues of the head as the direct or indirect result of an external force, with or without disruption of structural continuity.

**Exclusions:**

- Injury of eye or orbit (NA06)
- cerebral contusion (diffuse) focal (NA07.4)

### NA00.0

#### Superficial injury of scalp

**Coded Elsewhere:** Birth injury to scalp (KA42)

| <b>NA02.70</b>      | <p>Fracture of condylar process of mandible</p> <p>Condylar process fractures are defined as fractures running above or posterior to a line confined by the sigmoid notch line and the masseteric notch line. The mandibular condylar process comprises three fracture levels and is subdivided into the head region, the condylar neck, and the condylar base. Fractures of the condylar head show typical fracture lines either within the lateral pole zone, which may lead to loss of vertical height, or medially to the pole zone, with the latter ones usually not compromising the vertical condyle to disc and fossa relation. Fractures of the condylar neck and base can be differentiated according to radiologically based rules with regard to the proportion of the fracture line above and below the level of the sigmoid notch, and are basically subdivided according to the presence or absence of displacement or dislocation. Further parameters for definition are presence or absence of fragmentation, sideward displacement (medially or laterally), angulation of the superior main fragment and fracture-site geometry (e.g. straight or oblique, interfragmentary interdigitation)</p> <p><b>Exclusions:</b>                      Fracture of ramus of mandible (NA02.73)<br/> Fracture of subcondylar process of mandible (NA02.71)</p> |

| <b>NA03.0</b>       | <p><b>Dislocation of jaw</b></p> <p>Displacement of the mandible, the largest and strongest bone of the face constituting the lower jaw. Dislocation of the temporomandibular joint is a painful condition that occurs when the mandibular condyle becomes fixed in the anterosuperior aspect of the articular eminence.</p> <p>TMJ dislocation is due to either trauma or, more commonly, excessive opening of the mandible. Spasm of the masseter, temporalis, and internal pterygoid muscles results in trismus, preventing return of the condyle to the temporal fossa.</p> <p><b>Exclusions:</b>                      disc displacement (internal derangement of the TMJ) (DA0E.8)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                |                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>NA03.3</b>  | <b>Strain or sprain of jaw</b><br>A collective term for muscle and ligament injuries of the tissues associated with the mandible without dislocation or fracture; a joint injury in which some of the fibers of a supporting ligament are ruptured but the continuity of the ligament remains intact. A strain is an overstretching or overexertion of some part of the musculature. |

| <b>NA06.00</b> | <b>Eyelid avulsion</b><br>This is an injury in which a body structure is forcibly detached from its normal point of insertion by either trauma or surgery. The term most commonly refers to a surface trauma where all layers of the skin have been torn away, exposing the underlying structures (i.e. subcutaneous tissue, muscle, tendons, or bone). This is similar to an abrasion but more severe, where the eyelid can be partially or fully detached from the body. |

**NA07****Intracranial injury**

Damage inflicted on the tissues of the brain as the direct or indirect result of an external force, with or without disruption of structural continuity.

**Coded Elsewhere:** Intracranial laceration or haemorrhage due to birth injury (KA40.0)

Epilepsy due to injuries to the head (8A60.5)

**NA07.0****Concussion**

Loss or diminution of consciousness due to injury.

**Coding Note:** Code also the causing condition

**Inclusions:** Commotio cerebri

**NA07.00**

Concussion with incomplete loss of consciousness with amnesia

**NA07.01**

Concussion with incomplete loss of consciousness without amnesia

**NA07.02**

Concussion with loss of consciousness, short duration of less than 30 minutes

**NA07.03**

Concussion with loss of consciousness, short duration of 30 minutes to less than one hour

**NA07.04**

Concussion with loss of consciousness, short duration of one hour to less than 6 hours

**NA07.05**

Concussion with loss of consciousness, intermediate duration of 6 hours to less than 24 hours

**NA07.06**

Concussion with loss of consciousness, persisting longer than 24 hours or until discharge or latest assessment

**NA07.07**

Concussion with loss of consciousness, persisting until death

**NA07.08**

Concussion with loss of consciousness, duration unspecified or unknown due to effects of therapy

**NA07.09**

Concussion with loss of consciousness, duration unspecified or unknown due to lack of information

**NA07.0Y**

Other specified concussion

**Coding Note:** Code also the causing condition

**NA07.0Z**

Concussion, unspecified

**Coding Note:** Code also the causing condition

**NA07.1****Traumatic intracerebral haemorrhage**

**Inclusions:** traumatic intracerebral haematoma

**NA07.2****Traumatic cerebral oedema**

**Coded Elsewhere:** Cerebral oedema due to birth injury (KA40.1)

**NA07.20**

Diffuse traumatic cerebral oedema

**NA07.21**

Focal traumatic cerebral oedema

**NA0Z****Injuries to the head, unspecified**

- Coding Note:** This Block includes the following:
- injuries of face [any part]
  - injuries of gum
  - injuries of jaw
  - injuries of oral cavity
  - injuries of palate
  - injuries of periocular area
  - injuries of scalp
  - injuries of temporomandibular joint area
  - injuries of tongue
  - injuries of tooth

**Injuries to the neck (NA20-NA6Z)**

- Coding Note:** This Block includes the following:
- injuries of nape
  - injuries of supraclavicular region
  - injuries of throat

- Exclusions:**
- injury of spinal cord NOS (ND51)
  - Frostbite (NE40-NE4Z)
  - injury of trunk NOS (ND50-ND5Z)
  - fracture of spine NOS (ND50)
  - effects of foreign body in: larynx (ND72.3)
  - effects of foreign body in: oesophagus (ND73.1)
  - effects of foreign body in: pharynx (ND72.2)
  - effects of foreign body in: trachea (ND72.4)
  - burns and corrosions (ND90)

**NA20****Superficial injury of neck**

**Coded Elsewhere:** Sequelae of superficial injury or open wound of neck or trunk (NF2Y)

- NA20.0**      **Abrasion of throat**
- NA20.1**      **Contusion of throat**
- NA20.2**      **Other or unspecified superficial injuries of throat**
- NA20.3**      **Multiple superficial injuries of neck**

- Coding Note:** Each injury should be coded separately. This code should be used alone only when the detail of the specific injuries is unknown, or it is not possible to code each injury. This code may also be used in postcoordination to identify cases of complex trauma.

**NA64****Multiple injuries of neck**

**Coding Note:** Each injury should be coded separately. This code should be used alone only when the detail of the specific injuries is unknown, or it is not possible to code each injury. This code may also be used in postcoordination to identify cases of complex trauma.

**NA6Y****Other specified injuries to the neck**

**Coding Note:** This Block includes the following:

- injuries of nape
- injuries of supraclavicular region
- injuries of throat

**NA6Z****Injuries to the neck, unspecified**

**Coding Note:** This Block includes the following:

- injuries of nape
- injuries of supraclavicular region
- injuries of throat

**Injuries to the thorax (NA80-NB3Z)**

**Exclusions:**

- injuries of spinal cord NOS (ND51)
- injuries of shoulder (NC10-NC1Z)
- Injuries of trunk NOS (ND51)
- insect bite or sting, venomous (NE61)
- fracture of spine NOS (ND50)
- injuries of clavicle (NC10-NC1Z)
- injuries of scapular region (NC10-NC1Z)
- Frostbite (NE40-NE4Z)
- injuries of axilla (NC10-NC1Z)
- effects of foreign body in lung (ND72)
- effects of foreign body in bronchus (ND72.5)
- Foreign body in trachea (ND72.4)
- Foreign body in oesophagus (ND73.1)
- Burns (ND90-NE2Z)

**Coded Elsewhere:** Birth injury of thorax (KA45.3)

**NA80****Superficial injury of thorax**

Damage inflicted on the surface or shallow tissues of the thorax as the direct or indirect result of an external force, with or without disruption of structural continuity.

**Coded Elsewhere:** Sequelae of superficial injury or open wound of neck or trunk (NF2Y)

## Injuries to the abdomen, lower back, lumbar spine or pelvis (NB50-NB9Z)

**Exclusions:**

- insect bite or sting, venomous (NE61)
- Foreign body in anus or rectum (ND73.5)
- Foreign body in genitourinary tract (ND74)
- Burns (ND90-NE2Z)
- Foreign body in colon (ND73.4)
- Fracture of spine, level unspecified (ND50)
- injuries of trunk NOS (ND51)
- injuries of spinal cord NOS (ND51)
- Frostbite (NE40-NE4Z)
- Foreign body in stomach (ND73.2)
- Foreign body in small intestine (ND73.3)

### **NB50**

#### **Superficial injury of abdomen, lower back or pelvis**

Damage inflicted on the surface or shallow tissues of the abdomen, lower back and pelvis as the direct or indirect result of an external force, with or without disruption of structural continuity.

**Exclusions:** superficial injury of hip (NC70)

**Coded Elsewhere:** Sequelae of superficial injury or open wound of neck or trunk (NF2Y)

**NB50.0 Abrasion of lower back or pelvis**

**NB50.1 Contusion of lower back or pelvis**

**NB50.2 Abrasion of abdominal wall**

**NB50.3 Contusion of abdominal wall**

**NB50.4 Abrasion of external genital organs**

**Coded Elsewhere:** Birth injury to external genitalia (KA43.1)

**NB50.5 Contusion of external genital organs**

**Coded Elsewhere:** Birth injury to external genitalia (KA43.1)

**NB50.6 Multiple superficial injuries of abdomen, lower back or pelvis**

**Coding Note:** Each injury should be coded separately. This code should be used only when the detail of the specific injuries is unknown, or it is not possible to code each injury.

**NB50.Y Other specified superficial injury of abdomen, lower back or pelvis**

**NB50.Z Superficial injury of abdomen, lower back or pelvis, unspecified**

### **NB51**

#### **Open wound of abdomen, lower back or pelvis**

**Exclusions:**

- open wound of hip (NC71)
- traumatic amputation of part of abdomen, lower back and pelvis (NB93)

| <b>Coding Note:</b> | Assign additional codes for the specific injuries.                                                 |
| <b>NC16.4Z</b>      | Injury of multiple muscles or tendons at shoulder or upper arm level, unspecified                  |
| <b>Coding Note:</b> | Assign additional codes for the specific injuries.                                                 |
| <b>NC16.5</b>       | <b>Injury of bursa of shoulder</b>                                                                 |

**NC16.Y**      **Injury of other specified muscle, fascia, tendon or bursa at shoulder or upper arm level**

**NC16.Z**      **Injury of unspecified muscle, fascia or tendon at shoulder or upper arm level**

**NC17**      **Crushing injury of shoulder or upper arm**

*Exclusions:*      Crushing injury of elbow (NC37.0)

**NC18**      **Traumatic amputation of shoulder or upper arm**

*Exclusions:*      traumatic amputation of arm, level unspecified (ND53)  
traumatic amputation at elbow level (NC38)

**NC18.0**      **Traumatic amputation at right shoulder joint**

**NC18.1**      **Traumatic amputation at left shoulder joint**

**NC18.2**      **Traumatic amputation at shoulder joint, bilateral**

**NC18.3**      **Traumatic amputation at level between right shoulder and elbow**

**NC18.4**      **Traumatic amputation at level between left shoulder and elbow**

**NC18.5**      **Traumatic amputation at level between shoulder and elbow, bilateral**

**NC18.Z**      **Traumatic amputation of shoulder or upper arm, unspecified**

**NC19**      **Multiple injuries of shoulder or upper arm**

*Coding Note:*      Each injury should be coded separately. This code should be used alone only when the detail of the specific injuries is unknown, or it is not possible to code each injury. This code may also be used in postcoordination to identify cases of complex trauma.

**NC1Y**      **Other specified injuries to the shoulder or upper arm**

**NC1Z**      **Injuries to the shoulder or upper arm, unspecified**

## Injuries to the elbow or forearm (NC30-NC3Z)

*Exclusions:*      Injuries to the wrist or hand (NC50-NC5Z)  
Insect bite or sting, venomous (NE61)  
Burns (ND90-NE2Z)  
Frostbite (NE40-NE4Z)  
Other injuries of arm, level unspecified (ND53)

**NC30**      **Superficial injury of forearm**

*Exclusions:*      Superficial injury of wrist or hand (NC51)

**NC30.0**      **Abrasion of elbow**

**NC30.1**      **Contusion of elbow**

**NC30.2**      **Abrasion of other or unspecified parts of forearm**
