## Synovial-like neoplasms

### Synovial-like neoplasms, benign

**XH2AW8**      **Synovioma, benign**

### Synovial-like neoplasms, malignant

**XH9B22**      **Synovial sarcoma, NOS**

*Inclusions:*      Synovioma, NOS  
Synovioma, malignant

**XH77N6**      **Clear cell sarcoma, NOS**

**XH9346**      **Synovial sarcoma, spindle cell**

*Inclusions:*      Synovial sarcoma, monophasic fibrous

**XH06L8**      **Synovial sarcoma, epithelioid cell**

**XH1J28**      **Synovial sarcoma, biphasic**

**XH3797**      **Biphenotypic sinonasal sarcoma**

**XH5854**      **Malignant melanoma of soft parts**

A soft tissue sarcoma of young adults with melanocytic differentiation, typically involving tendons and aponeuroses. This tumour is unrelated to paediatric lesions currently known as clear cell sarcoma of the kidney.

## Thymic epithelial neoplasms

### Thymic epithelial neoplasms, benign

**XH9QW0**      **Microscopic thymoma**

**XH4341**      **Thymoma, benign**

**XH0707**      **Ectopic hamartomatous thymoma**

### Thymic epithelial neoplasms, malignant

**XH6WN9**      **Thymoma, type A**

*Inclusions:*      Thymoma, medullary  
Thymoma, spindle cell

**XH0JH0**      **Thymoma, type AB**

*Inclusions:*      Thymoma, mixed type

**XH66U8**

**Thymoma, type B1**

**Inclusions:** Thymoma, predominantly cortical  
Thymoma, organoid  
Thymoma, lymphocyte-rich  
Thymoma, lymphocytic

**XH2G89**

**Thymoma, type B2**

**Inclusions:** Thymoma, cortical

**XH4EW9**

**Thymoma, type B3**

**Inclusions:** Thymoma, atypical  
Thymoma, epithelial  
Well differentiated thymic carcinoma

**XH3734**

**Thymoma, NOS**

**XH1GA4**

**Intrapulmonary thymoma**

**XH6QN6**

**Sclerosing thymoma**

**XH3DX0**

**Metaplastic thymoma**

**XH6AK2**

**Thymic carcinoma, NOS**

**Inclusions:** Thymoma, type C

**XH6ZG8**

**Spindle epithelial tumour with thymus-like element**

**Inclusions:** SETTLE

**XH33N4**

**Intrathyroid thymic carcinoma**

**Inclusions:** Carcinoma showing thymus-like differentiation  
CASTLE  
Carcinoma showing thymus-like element

Thymic epithelial neoplasms, uncertain whether benign or malignant

**XH56K5**

**Micronodular thymoma with lymphoid stroma**

Transitional cell papillomas and carcinomas

Transitional cell papillomas and carcinomas, benign

**XH0TP8**

**Sinonasal papilloma, exophytic**

**XH3HQ8**

**Transitional papilloma, inverted, NOS**

Change from 8121/1 to 8121/0 in ICD-O3 2016

**XH5A08**      **Urothelial papilloma, inverted**

**XH5M82**      **Urothelial papilloma, NOS**

Transitional cell papillomas and carcinomas, in situ

**XH12F0**      **Papillary urothelial carcinoma, non-invasive**

**XH5GH8**      **Urothelial carcinoma in situ**

Transitional cell papillomas and carcinomas, malignant

**XH4UA2**      **Cylindrical cell carcinoma**

**XH35M0**      **Schneiderian carcinoma**

**XH8EH1**      **Transitional cell carcinoma, NOS**

*Inclusions:*      Urothelial carcinoma, NOS

**XH7TL4**      **Transitional carcinoma**

**XH5P27**      **Urothelial carcinoma, sarcomatoid**

*Inclusions:*      Transitional cell carcinoma, sarcomatoid

Urothelial carcinoma, spindle cell

Transitional cell carcinoma, spindle cell

**XH0NZ4**      **Papillary urothelial carcinoma**

**XH08S6**      **Transitional cell carcinoma, micropapillary**

**XH3UJ1**      **Cloacogenic carcinoma**

**XH2V80**      **Basaloid carcinoma**

**XH4W76**      **Urothelial carcinoma, micropapillary**

Transitional cell papillomas and carcinomas, uncertain whether benign or malignant

**Coded Elsewhere:** Urothelial papilloma, NOS (XH5M82)

**XH7R01**      **Cylindrical cell papilloma**

**XH4PB5**      **Schneiderian papilloma, inverted**

**XH5UU5**      **Papillary urothelial neoplasm of low malignant potential**

**XH8FH7**      **Sinonasal papilloma, inverted**

**XH8CD4**      **Sinonasal papilloma, oncocytic**

## Trophoblastic neoplasms

### Trophoblastic neoplasms, benign

- XH8CX2**      **Hydatidiform mole, NOS**  
*Inclusions:*      Complete hydatidiform mole  
                         Hydatid mole
- XH5325**      **Partial hydatidiform mole**

### Trophoblastic neoplasms, malignant

- XH3WM1**      **Choriocarcinoma combined with other germ cell elements**  
*Inclusions:*      Choriocarcinoma combined with embryonal carcinoma  
                         Choriocarcinoma combined with teratoma
- XH0774**      **Malignant teratoma, trophoblastic**
- XH8PK7**      **Choriocarcinoma, NOS**  
*Inclusions:*      Chorioepithelioma  
                         Chorionepithelioma
- XH8FW3**      **Trophoblastic tumour, epithelioid**

### Trophoblastic neoplasms, uncertain whether benign or malignant

- XH46G2**      **Invasive hydatidiform mole**
- XH1RM5**      **Placental site trophoblastic tumour**

## Myelodysplastic syndromes

### Myelodysplastic syndromes, malignant

- XH2N45**      **Myelodysplastic syndrome with single lineage dysplasia**
- XH5B21**      **Myelodysplastic syndrome with ring sideroblasts and single lineage dysplasia**
- XH79X8**      **Myelodysplastic syndrome with excess blasts**
- XH1D20**      **Refractory anaemia with excess blasts in transformation**  
*Inclusions:*      RAEB-T
- XH5DA2**      **Myelodysplastic syndrome with multilineage dysplasia**
- XH3T02**      **Myelodysplastic syndrome with isolated del (5q)**

**XH0L58**

**Therapy-related myelodysplastic syndrome, NOS**

**Inclusions:** Therapy-related myelodysplastic syndrome, epipodophyllotoxin-related  
Therapy-related myelodysplastic syndrome, alkylating agent related

**XH7PK9**

**Myelodysplastic syndrome, NOS**

**Inclusions:** Preleukemic syndrome  
Myelodysplastic syndrome, unclassifiable

**XH8BA8**

**Myelodysplastic syndrome with ring sideroblasts and multilineage dysplasia**

Other haematologic disorders

Other haematologic disorders, malignant

**Coded Elsewhere:** Polymorphic post transplant lymphoproliferative disorder (XH74K1)

**XH3EJ1**

**Myeloproliferative neoplasm, unclassifiable**

**XH28M3**

**Myelodysplastic/myeloproliferative neoplasm, unclassifiable**

Other haematologic disorders, uncertain whether benign or malignant

**XH2LK2**

**Lymphoproliferative disorder, NOS**

**Inclusions:** Lymphoproliferative disease, NOS

**XH2R75**

**Post transplant lymphoproliferative disorder, NOS**

**Inclusions:** PTLD, NOS

**XH74K1**

**Polymorphic post transplant lymphoproliferative disorder**

Chronic myeloproliferative disorders

Chronic myeloproliferative disorders, malignant

**XH0453**

**Polycythaemia vera**

**Inclusions:** Chronic erythremia

**XH5HH7**

**Myeloproliferative neoplasm, NOS**

**Inclusions:** Myeloproliferative disease, NOS  
Chronic myeloproliferative disorder  
Chronic myeloproliferative disease, NOS

**XH7GG7**

**Primary myelofibrosis**

**Inclusions:**

Myelosclerosis with myeloid metaplasia  
Myelofibrosis with myeloid metaplasia  
Myelofibrosis as a result of myeloproliferative disease  
Megakaryocytic myelosclerosis  
Chronic idiopathic myelofibrosis  
Agnogenic myeloid metaplasia

**XH4ZM5**

**Essential thrombocythemia**

**Inclusions:**

Idiopathic thrombocythemia

**XH5NQ7**

**Chronic neutrophilic leukaemia**

**XH51D2**

**Chronic eosinophilic leukaemia**

**XH07H5**

**Myeloid and lymphoid neoplasms with PDGFRA rearrangement**

**XH6QD4**

**Myeloid neoplasms with PDGFRB rearrangement**

**XH1WR8**

**Myeloid and lymphoid neoplasms with FGFR1 abnormalities**

**XH2WB4**

**Myeloid or lymphoid neoplasm with PCM1-JAK2**

Leukaemias

leukaemias, NOS, malignant

**XH4S92**

**Leukaemia, NOS**

**XH29P0**

**Aleukemic leukaemia, NOS**

**XH80C3**

**Chronic leukaemia, NOS**

**XH6QV5**

**Subacute leukaemia, NOS**

**XH1B20**

**Acute leukaemia, NOS**

**XH37U0**

**Acute biphenotypic leukaemia**

**XH2H98**

**Acute bilineal leukaemia**

**XH3VV7**

**Acute mixed lineage leukaemia**

**XH97B7**

**Mixed phenotype acute leukaemia with t(9;22)(q34;q11.2); BCR-ABL1**

**XH2S51**

**Mixed phenotype acute leukaemia with t(v;11q23); MLL rearranged**

**XH1928**

**Mixed phenotype acute leukaemia, B/myeloid, NOS**

**XH4YB5**

**Mixed phenotype acute leukaemia, T/myeloid, NOS**

## Lymphoid leukaemias, malignant

## Dimensions of injury

A grouping for dimensions of injury that are supplementary to the fully specified injury chapter codes, i.e. concepts that can not, or are likely to not be able to be used as a standalone code in mortality or morbidity-coded data.

### Dimensions of Burns

Burns classified according to extent of body surface involved

|              |                                                      |
|--------------|------------------------------------------------------|
| <b>XJ4PF</b> | <b>Burns involving less than 10% of body surface</b> |
| <b>XJ4NH</b> | <b>Burns involving less than 5% of body surface</b>  |
| <b>XJ7TR</b> | <b>Burns involving 5-9% of body surface</b>          |
| <b>XJ257</b> | <b>Burns involving 10-19% of body surface</b>        |
| <b>XJ5GA</b> | <b>Burns involving 20-29% of body surface</b>        |
| <b>XJ7ZW</b> | <b>Burns involving 30-39% of body surface</b>        |
| <b>XJ3R2</b> | <b>Burns involving 40-49% of body surface</b>        |
| <b>XJ19C</b> | <b>Burns involving 50-59% of body surface</b>        |

|              |                                                    |
|--------------|----------------------------------------------------|
| <b>XJ4B7</b> | <b>Burns involving 60-69% of body surface</b>      |
| <b>XJ7F7</b> | <b>Burns involving 70-79% of body surface</b>      |
| <b>XJ1HD</b> | <b>Burns involving 80-89% of body surface</b>      |
| <b>XJ9JX</b> | <b>Burns involving 90% or more of body surface</b> |

Extent of body surface with full thickness or deep full thickness burn

|              |                                                                                           |
|--------------|-------------------------------------------------------------------------------------------|
| <b>XJ31W</b> | <b>Full thickness or deep full thickness burn involving less than 10% of body surface</b> |
| <b>XJ243</b> | <b>Full thickness or deep full thickness burn involving less than 5% of body surface</b>  |
| <b>XJ4FJ</b> | <b>Full thickness or deep full thickness burn involving 5-9% of body surface</b>          |
| <b>XJ82Z</b> | <b>Full thickness or deep full thickness burn involving 10-19% of body surface</b>        |
| <b>XJ3XZ</b> | <b>Full thickness or deep full thickness burn involving 20-29% of body surface</b>        |
| <b>XJ1NG</b> | <b>Full thickness or deep full thickness burn involving 30-39% of body surface</b>        |
| <b>XJ4CR</b> | <b>Full thickness or deep full thickness burn involving 40-49% of body surface</b>        |
| <b>XJ9MY</b> | <b>Full thickness or deep full thickness burn involving 50-59% of body surface</b>        |
| <b>XJ8E0</b> | <b>Full thickness or deep full thickness burn involving 60-69% of body surface</b>        |
| <b>XJ68M</b> | <b>Full thickness or deep full thickness burn involving 70-79% of body surface</b>        |
| <b>XJ9UE</b> | <b>Full thickness or deep full thickness burn involving 80-89% of body surface</b>        |
| <b>XJ3MB</b> | <b>Full thickness or deep full thickness burn involving 90% or more of body surface</b>   |

Outcome of deep full thickness or complex burn

Whether a deep full thickness or complex burn has resulted in the loss of a limb.

|              |                                                                 |
|--------------|-----------------------------------------------------------------|
| <b>XJ71T</b> | <b>Deep full thickness or complex burn with no loss of limb</b> |
|--------------|-----------------------------------------------------------------|

**XJ6NX**

**Deep full thickness or complex burn with loss of digit**

Loss of digit or digits (toes or fingers including thumbs) either by surgical amputation necessitated by the burn, or through complete physical destruction as a result of a burn.

**XJ36Y**

**Deep full thickness or complex burn with loss of limb**

Loss of limb or limbs (arms or legs) either by surgical amputation necessitated by the burn, or through complete physical destruction as a result of a burn.

Joint involvement in fracture

**XJ5GS**

**Fracture extends into joint**

Fracture involves articular surface or surfaces.

**XJ5L7**

**Fracture extends into joint and a portion of the articular part remains attached to the main part of the bone**

*Inclusions:* partial articular fractures

**XJ92H**

**Fracture extends into joint and the entire articular part is detached from the main part of the bone**

**XJ5VJ**

**Fracture does not extend into joint**

Fractures that do not involve an articular surface.

Open fracture or closed fracture

**XJ44E**

**Closed fracture**

**XJ7YM**

**Open fracture**

Fracture types

**XJ36W**

**Avulsion fracture**

**XJ2EL**

**Bucket handle or corner fracture**

**XJ76E**

**Buckle fracture**

**XJ7ZH**

**Burst fracture**

**XJ1Z6**

**Comminuted fracture**

**XJ1PP**

**Compound fracture**

**XJ778**

**Compression fracture**

**XJ9UB**

**Depressed fracture**

**XJ69V**

**Dislocated fracture**

**XJ8PQ**

**Displaced fracture**

|              |                                   |
|--------------|-----------------------------------|
| <b>XJ0QE</b> | <b>Elevated fracture</b>          |
| <b>XJ5N9</b> | <b>Fissured fracture</b>          |

| <b>XJ7AT</b> | <b>Impacted fracture</b>          |
| <b>XJ4PE</b> | <b>Infected fracture</b>          |
| <b>XJ392</b> | <b>Linear fracture</b>            |
| <b>XJ6RL</b> | <b>Longitudinal fracture</b>      |
| <b>XJ4CX</b> | <b>Missile fracture</b>           |
| <b>XJ4FU</b> | <b>Osteochondral fracture</b>     |
| <b>XJ3HH</b> | <b>Physeal fracture</b>           |
| <b>XJ64N</b> | <b>Puncture fracture</b>          |
| <b>XJ909</b> | <b>Simple fracture</b>            |
| <b>XJ9XQ</b> | <b>Slipped epiphysis fracture</b> |
| <b>XJ967</b> | <b>Spiral fracture</b>            |
| <b>XJ5V7</b> | <b>Transverse fracture</b>        |
| <b>XJ6NA</b> | <b>Wedge fracture</b>             |
| <b>XJ8QL</b> | <b>Fracture with foreign body</b> |

#### Types of superficial injuries

|              |                                 |
|--------------|---------------------------------|
| <b>XJ652</b> | <b>Abrasion</b>                 |
| <b>XJ8JK</b> | <b>Blister, nonthermal</b>      |
| <b>XJ9NV</b> | <b>Contusion</b>                |
| <b>XJ4D1</b> | <b>External constriction</b>    |
| <b>XJ69A</b> | <b>Insect bite, nonvenomous</b> |
| <b>XJ06K</b> | <b>Superficial foreign body</b> |
| <b>XJ3U1</b> | <b>Superficial splinter</b>     |
| <b>XJ1C6</b> | <b>Superficial haematoma</b>    |

## Dimensions of external causes

### Additional aspects of mechanism

|              |                                                                              |
|--------------|------------------------------------------------------------------------------|
| <b>XE72E</b> | <b>Exposure to injurious transport event</b>                                 |
| <b>XE9S7</b> | <b>Exposure to land transport injury event</b>                               |
| <b>XE9EE</b> | Exposure to land transport on-road injury event                              |
| <b>XE8TM</b> | Exposure to land transport off-road injury event                             |
| <b>XE3S3</b> | <b>Exposure to railway transport injury event</b>                            |
| <b>XE85L</b> | <b>Exposure to water transport injury event</b>                              |
| <b>XE5XH</b> | <b>Exposure to air or space transport injury event</b>                       |
| <b>XE3Y8</b> | <b>Exposure to fall</b>                                                      |
| <b>XE8J4</b> | <b>Exposure to fall on the same level or from less than 1 metre</b>          |
| <b>XE3QG</b> | <b>Exposure to fall from a height of 1 metre or more</b>                     |
| <b>XE4U1</b> | <b>Exposure to person, animal or plant</b>                                   |
| <b>XE1TU</b> | <b>Exposure to being struck, kicked, or bumped</b>                           |
| <b>XE0VW</b> | <b>Exposure to being stepped on or crushed</b>                               |
| <b>XE359</b> | <b>Exposure to being bitten</b>                                              |
| <b>XE9PG</b> | <b>Exposure to being scratched or clawed</b>                                 |
| <b>XE972</b> | <b>Exposure to being stung or envenomated</b>                                |
| <b>XE214</b> | <b>Exposure to object, not elsewhere classified</b>                          |
| <b>XE2YW</b> | <b>Exposure to being struck by projectile from firearm</b>                   |
| <b>XE4UV</b> | <b>Exposure to being struck by moving object</b>                             |
| <b>XE6LQ</b> | <b>Exposure to being struck against stationary object</b>                    |
| <b>XE20S</b> | <b>Exposure to being cut or pierced by sharp object</b>                      |
| <b>XE59C</b> | <b>Exposure to being struck by blunt object</b>                              |
| <b>XE4FE</b> | <b>Exposure to being caught, crushed, jammed or pinched between objects</b>  |
| <b>XE64Q</b> | <b>Exposure to immersion, submersion or falling into water</b>               |
| <b>XE72F</b> | <b>Exposure to drowning or submersion, while in body of water</b>            |
| <b>XE1AF</b> | <b>Exposure to drowning or submersion, following fall into body of water</b> |
| <b>XE8NX</b> | <b>Exposure to threat to breathing</b>                                       |

|              |                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------|
| <b>XE9N2</b> | <b>Exposure to threat to breathing by suffocation from object covering mouth or nose</b>        |
| <b>XE9LA</b> | <b>Exposure to threat to breathing by hanging</b>                                               |
| <b>XE17S</b> | <b>Exposure to threat to breathing by strangulation</b>                                         |
| <b>XE2NR</b> | <b>Exposure to threat to breathing by external compression of airways or chest</b>              |
| <b>XE33X</b> | <b>Exposure to threat to breathing by inhalation or ingestion of gastric contents</b>           |
| <b>XE2PV</b> | <b>Exposure to threat to breathing by inhalation or ingestion of liquids</b>                    |
| <b>XE5QH</b> | <b>Exposure to threat to breathing by inhalation or ingestion of food</b>                       |
| <b>XE9RJ</b> | <b>Exposure to threat to breathing by inhalation or ingestion of other objects or materials</b> |
| <b>XE2DJ</b> | <b>Exposure to threat to breathing from low oxygen environment</b>                              |
| <b>XE6JM</b> | <b>Exposure to thermal mechanism</b>                                                            |
| <b>XE0S0</b> | <b>Exposure to uncontrolled fire</b>                                                            |
| <b>XE5WP</b> | <b>Exposure to controlled fire</b>                                                              |
| <b>XE9T8</b> | <b>Exposure to ignition, or melting of material</b>                                             |
| <b>XE494</b> | <b>Exposure to hot object or liquid</b>                                                         |
| <b>XE515</b> | <b>Exposure to steam, hot vapour, air or gases</b>                                              |
| <b>XE00Z</b> | <b>Exposure to excessive heat</b>                                                               |
| <b>XE4AY</b> | <b>Exposure to excessive cold</b>                                                               |
| <b>XE3SH</b> | <b>Exposure to or harmful effects of substances</b>                                             |
| <b>XE13E</b> | <b>Poisoning or toxic effect of exposure to substance</b>                                       |
| <b>XE1SS</b> | <b>Corrosion due to exposure to substance</b>                                                   |

#### Exposure to other mechanism

|              |                                                                            |
|--------------|----------------------------------------------------------------------------|
| <b>XE202</b> | <b>Foreign body in orifice</b>                                             |
| <b>XE8A0</b> | <b>Exposure to electric current</b>                                        |
| <b>XE8DS</b> | <b>Exposure to sunlight</b>                                                |
| <b>XE60C</b> | <b>Exposure to radiation</b>                                               |
| <b>XE82Y</b> | <b>Exposure to welding light</b>                                           |
| <b>XE436</b> | <b>Exposure to other visible and ultraviolet light of man-made sources</b> |

Aspects of transport injury events

## Mode of transport of person injured in transport event

Collective term for forms of transportation. Includes types of vehicle; walking and other aspects of being a pedestrian (e.g. lying on a road); and using a pedestrian conveyance.

|              |                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE88K</b> | <b>Pedestrian as mode of transport of person injured in transport event</b><br>A pedestrian is any person involved in a transport crash who was not in or on a vehicle or pedestrian conveyance at the time.                                                        |
| <b>XE645</b> | <b>Person on foot injured in transport related event</b>                                                                                                                                                                                                            |

| <b>XE6TW</b> | Proximal risk factors for intentional self-harm, Cultural issue                                               |

Previous non-fatal intentional self harm

|              |                              |
|--------------|------------------------------|
| <b>XE76W</b> | Previous suicide attempt, No |
|--------------|------------------------------|

**XE3YR**      **Previous suicide attempt, Yes**

#### Intention to die aspect of self-harm

**Inclusions:**      parasuicide (incomplete suicide attempt)  
                         self-mutilation  
                         suicide

**XE97V**      **Intentional self-harm, person intended to die**  
Intentional self-harm with intent to cause the death of the person.

**XE5D6**      **Intentional self-harm, person did not intend to die**  
Self-injury, self-harm, cutting or self-mutilation undertaken intentionally for reasons other than to bring about the death of the person.

**XE2SF**      **Intentional self-harm, not known or not determined if person intended to die**  
Information that a competent person (e.g. psychiatrist, coroner) had concluded that it could not be determined whether the intentional self-harm was done with intent to die. No information or insufficient information was available.

#### Aspects of armed conflict

##### Type of armed conflict

**XE2RB**      **Type of conflict, civil war or guerrilla operation**

**XE324**      **Type of conflict, war**

**XE4RJ**      **Type of conflict, declared terrorism**

**XE0EG**      **Type of conflict, civil insurrection**

**XE7HW**      **Type of conflict, postconflict incident**

##### Role of injured person in armed conflict

**XE42H**      **Military personnel**

**XE2WZ**      **Civilian**

**XE3P0**      **Role of injured person in armed conflict unknown**

##### Type of legal intervention

**XE52B**      **Potential arrest situation**

**XE9JF**      **Type of legal intervention, potential arrest related traffic pursuit**

|              |                                                                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE01Z</b> | Difficult to open or remove packaging material<br>Problem associated with difficulty for users to operate the device, specifically as it relates to the opening or removal of the outer wrapping.                     |
| <b>XE5YH</b> | Incomplete or missing packaging<br>Problem associated with the nonconformance to the device specifications due to incomplete or missing packaging that may compromise the device operation as intended.               |
| <b>XE4VM</b> | Unsealed device packaging<br>Problem associated with the loss of packaging seal.                                                                                                                                      |
| <b>XE2AN</b> | Tear, rip or hole in device packaging<br>Problem associated with packaging damage (tear, rip or hole) prior to the use of the device.                                                                                 |
| <b>XE151</b> | <b>Device misassembled during manufacturing or shipping</b>                                                                                                                                                           |
| <b>XE9R8</b> | Component misassembled<br>A device found to have one or more components incorrectly assembled when delivered to the user facility.                                                                                    |
| <b>XE89V</b> | Component missing<br>A device component(s) found to be missing when delivered to the user facility.                                                                                                                   |
| <b>XE8ZA</b> | <b>Shipping damage or problem</b><br>Problem associated with shipping damage or problem prior to the use of the device.                                                                                               |
| <b>XE78P</b> | Delivered as unsterile product<br>Problem associated with a device being received in such a manner to indicate that its sterility has been compromised (e.g. sterile packaging breached, visible contaminate present) |
| <b>XE52X</b> | <b>Chemical problem</b><br>Problem associated with any from the documented specifications of the device that relate to any chemical characterization, i.e., element, compound, or mixture.                            |
| <b>XE9AC</b> | <b>Device emits odour</b><br>Problem associated with an unexpected or inappropriate smell released by the device.                                                                                                     |
| <b>XE3E0</b> | <b>Device ingredient or reagent problem</b><br>Problem associated with any deviations from the documented specifications of the device that relate to any ingredient or reagent characterization.                     |
| <b>XE4BC</b> | Clumping in device or device ingredient<br>Problem associated with the aggregation of particles into irregular masses.                                                                                                |

|              |                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE49W</b> | Coagulation in device or device ingredient<br>Problem associated with the undesired characterization of congealing, solidifying, thickening, curdling.                                                       |
| <b>XE4VP</b> | Precipitate in device or device ingredient<br>Problem associated with the separation of solid particles from a liquid as the result of a chemical or physical change.                                        |
| <b>XE8Z6</b> | Cross reactivity<br>Problem associated with the degree to which an antibody or antigen participates in cross reactions.                                                                                      |
| <b>XE0VB</b> | Particulates<br>Substances that consist of separate particles that are introduced by the device during use.                                                                                                  |
| <b>XE0K7</b> | High pH<br>pH higher than expected and / or anticipated.                                                                                                                                                     |
| <b>XE657</b> | Low pH<br>pH lower than expected and / or anticipated.                                                                                                                                                       |
| <b>XE6E7</b> | <b>Improper chemical reaction</b>                                                                                                                                                                            |
| <b>XE4LP</b> | <b>Material integrity problem</b><br>Problem associated with any deviations from the documented specifications of the device that relate to the limited durability of all material used to construct device. |
| <b>XE8D2</b> | <b>Break</b><br>Problem associated with undesired damage or breakage of those materials used in the device construction.                                                                                     |
| <b>XE1M6</b> | Fracture of device<br>Problem associated with a partial or full-thickness crack in the device materials.                                                                                                     |
| <b>XE9DU</b> | Loss of or failure to bond<br>Problem associated with lack or loss of adherence between materials intended to be joined together by an adhesive.                                                             |
| <b>XE2ET</b> | Material fragmentation<br>Problem associated with small pieces of the device breaking off unexpectedly.                                                                                                      |
| <b>XE82N</b> | Solder joint fracture<br>Problem associated with undesired damage or breakage in a solder joint of materials used in the device construction.                                                                |
| <b>XE638</b> | <b>Burst container or vessel</b><br>Problem associated with the pressure inside a vessel or container rising to such a degree that the container ruptures.                                                   |

|              |                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE5EZ</b> | <b>Explosion</b><br>Problem associated with the violent bursting due to the sudden expansion of air, gas or fluid.                                                                                                                   |
| <b>XE38M</b> | <b>Crack</b><br>Problem associated with an undesired partial separation and/or a visible opening along the length or width in the materials that are used in the device construction.                                                |
| <b>XE0HB</b> | <b>Degraded</b><br>Problem associated with a undesired change in the chemical structure, physical properties, or appearance in the materials that are used in the device construction.                                               |
| <b>XE8J3</b> | <b>Calcified</b><br>Problem associated with buildup of calcium salts on the device.                                                                                                                                                  |
| <b>XE228</b> | <b>Corroded</b><br>Problem associated with the chemical or electrochemical reaction between materials, usually a metal and its environment that produces a deterioration of the metal and its properties.                            |
| <b>XE1WE</b> | <b>Material erosion</b><br>Problem associated with a progressive loss of a material from a solid surface.                                                                                                                            |
| <b>XE9F6</b> | <b>Pitted</b><br>Problem associated with the corrosion of a material's surface, confined to a point or small area that takes the form of cavities.                                                                                   |
| <b>XE0YK</b> | <b>Flaked</b><br>Problem associated with the detachment of small pieces of the coating film of a material.                                                                                                                           |
| <b>XE3VG</b> | <b>Peeled or delaminated</b><br>Peeling or delamination of composite materials, including coatings, that occurs when layers are separated as a result of stress or impact and resulting in loss of mechanical toughness.             |
| <b>XE975</b> | <b>Naturally worn</b><br>Problem associated with material damage to a surface, usually involving progressive loss or displacement of material, due to relative motion between that surface and a contacting substance or substances. |
| <b>XE9JW</b> | <b>Unraveled material</b><br>Problem due to the undesired unravelling of material (e.g. disentangled, unwound etc.).                                                                                                                 |
| <b>XE1LJ</b> | <b>Material deformation</b><br>Problem associated with an undesired material change in shape or property caused by external forces.                                                                                                  |

|              |                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE0JB</b> | <p>Deformation due to compressive stress</p> <p>Problem associated with an undesired bulge, bend, bow, kink, or wavy condition observed in the device material resulting from compressive stresses.</p>    |
| <b>XE5NT</b> | <p>Dent in material</p> <p>Problem associated with a undesired change in shape, characterised by the presence of a slight hollow (dent) in the device surface.</p>                                         |
| <b>XE0ZV</b> | <p>Failure to fold</p> <p>Problem associated with an undesired material change in physical property, characterised by failure to fold.</p>                                                                 |
| <b>XE06Q</b> | <p>Failure to unfold or unwrap</p> <p>Problem associated with the comprising materials' deformation in that device fails to open its wrapping or open/extend in a certain manner i.e. balloon or lens.</p> |
| <b>XE37M</b> | <p>Material frayed</p> <p>Problem associated with the comprising materials having damaged edges.</p>                                                                                                       |
| <b>XE8PS</b> | <p>Material invagination</p> <p>Problem associated with an undesired material change in shape, characterised by the infolding of one part within another part of a structure.</p>                          |
| <b>XE4Z7</b> | <p>Material too rigid or stiff</p> <p>Problem associated with an undesired material change in physical property, characterised by rigidity (it resists deformation in response to an applied force).</p>   |
| <b>XE9WH</b> | <p>Material too soft or flexible</p> <p>Problem associated with any device material that results in the material's inability to maintain the desired shape or support function.</p>                        |
| <b>XE47S</b> | <p>Material twisted or bent</p> <p>Problem associated with deformations that lead to twisting or bending of the device.</p>                                                                                |
| <b>XE8ZQ</b> | <p>Melted</p> <p>Problem associated with a solid device being transformed into a molten or liquid state.</p>                                                                                               |
| <b>XE5D0</b> | <p>Stretched</p> <p>Problem associated with an increase or elongation in a materials' dimension.</p>                                                                                                       |
| <b>XE2G9</b> | <p><b>Material discoloured</b></p> <p>Problem associated with an undesired streak, pattern and/or a noticeable change in color from the rest of the materials used in the device construction.</p>         |
| <b>XE0RF</b> | <p><b>Material disintegration</b></p> <p>Problem associated with material breaking into small particles.</p>                                                                                               |

| <b>XE1Q1</b> | Device slipped<br>Problem associated with the device moving or sliding from the intended position.                                                                                                        |
| <b>XE0QZ</b> | Unintended collision of device<br>Problem associated with the device impacting with another object.                                                                                                       |
| <b>XE1Y1</b> | Unintended system motion<br>Problem associated with any motion of the system or components that was not initiated by the user.                                                                            |
| <b>XE5CH</b> | Unstable device<br>Problem associated with the mechanical stability of the device.                                                                                                                        |
| <b>XE76A</b> | Vibration of device<br>Problem associated with the undesirable mechanical oscillation.                                                                                                                    |
| <b>XE941</b> | <b>Optical problem</b><br>Problem associated with transmission of visible light affecting the quality of the image transmitted or otherwise affecting the intended application of the visible light path. |
| <b>XE5CX</b> | <b>Misfocusing</b><br>The problem relates to the poor focusing of the object or the focus is on the wrong object or in the wrong area.                                                                    |
| <b>XE4W1</b> | <b>Optical decentration</b><br>Problem associated with being off-center of optical lenses.                                                                                                                |
| <b>XE1VT</b> | <b>Optical discolouration</b><br>Problem associated with an undesired change of color.                                                                                                                    |
| <b>XE4BE</b> | <b>Optical distortion</b><br>Problem associated with an optical defect in an image-forming system whereby the image is not the shape of an ideal image of the object.                                     |
| <b>XE93N</b> | <b>Optical obstruction</b><br>Problem associated with the blocking of optical devices, e.g. visual pathways.                                                                                              |
| <b>XE28Y</b> | <b>Output problem</b><br>Problem associated with any deviation from the documented specifications of the device that relate to the end result, data, or test results provided by the device.              |

|              |                                                                                                                                                                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE8NW</b> | <b>Audible prompt or feedback</b><br>Problem with any deviation from the documented specifications of the device that relate to audible feedback, e.g. voice prompts or beeps, but not safety-related alarms which are covered under "Protective measures problem".          |
| <b>XE0WU</b> | Inappropriate audible prompt or feedback<br>Problem with audible messages which do not guide a device user to the correct action.                                                                                                                                            |
| <b>XE487</b> | Inaudible or unclear audible prompt or feedback<br>Problem associated with audible prompts which cannot be heard clearly.                                                                                                                                                    |
| <b>XE8MP</b> | No audible prompt or feedback<br>Problem associated with the device ceasing to provide audible prompts.                                                                                                                                                                      |
| <b>XE2S2</b> | <b>Display or visual feedback problem</b><br>Problem with any deviation from the documented specifications of the device that relate to visual feedback, e.g. the display of information, images on a screen, or output from the device.                                     |
| <b>XE4TX</b> | Device displays incorrect message<br>Problem associated with providing incorrect display information.                                                                                                                                                                        |
| <b>XE2NW</b> | Display difficult to read<br>Problem associated with legibility of the display, compromising for instance the reading/interpretation of patient parameters or test results. Legibility problems can be due to color, size of font, display screen contrast or other factors. |
| <b>XE2ES</b> | Erratic or intermittent display<br>A device does not consistently display the same message, result, reading, or image. E.g. the display might flicker, switch between readings or messages, or go completely blank for brief periods of time.                                |
| <b>XE7T8</b> | Image display error or artifact<br>Problem with image display leading to corrupted images or readouts/measurement indications.                                                                                                                                               |
| <b>XE2V3</b> | Image orientation incorrect<br>Problem associated with an incorrect image orientation on the device display.                                                                                                                                                                 |
| <b>XE5Q5</b> | No display or image<br>Problem associated with the absence of display or image.                                                                                                                                                                                              |
| <b>XE4FQ</b> | No visual prompts or feedback<br>Problem associated with the device ceasing to provide visual feedback.                                                                                                                                                                      |
| <b>XE5XP</b> | Poor quality image<br>Inadequate quality of an image or any visual representation displayed by the device, or output from the device.                                                                                                                                        |

|              |                                                                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE1C5</b> | Visual prompts will not clear<br>Problem with visual messages which continue to be displayed on / by the device after the appropriate action has been taken.                       |
| <b>XE7Z4</b> | <b>Tactile prompts or feedback</b><br>Problem with any deviation from the documented specifications of the device that relate to tactile feedback, e.g. device vibrational prompt. |
| <b>XE6CE</b> | Inappropriate tactile prompt or feedback<br>Problem with tactile feedback which does not guide a device user to the correct action.                                                |
| <b>XE963</b> | No tactile prompts or feedback<br>Problem associated with the device ceasing to provide tactile feedback.                                                                          |
| <b>XE0KH</b> | <b>Energy output problem</b><br>Problem with the device's intended output of energy.                                                                                               |
| <b>XE7ST</b> | Energy spectrum incorrect<br>Problem associated with the energy output from the device not being in the expected part of the spectrum.                                             |
| <b>XE5PU</b> | Failure to deliver energy<br>Problem associated with the failure of the device to deliver any energy.                                                                              |
| <b>XE538</b> | Intermittent energy output<br>Problem associated with the energy output from the device being inconsistent over time.                                                              |
| <b>XE81P</b> | Output above specifications<br>Device output is exceeding the documented specifications of the device.                                                                             |
| <b>XE8XC</b> | Output below specifications<br>Device output is below the documented specifications of the device.                                                                                 |
| <b>XE2MC</b> | Therapeutic or diagnostic output failure<br>Problem associated with the failure of the device to deliver the output required for treatment or identification of a disease.         |
| <b>XE1US</b> | Therapy delivered to incorrect body area<br>Problem associated with the device causing unintended therapeutic action to an area of the body other than the intended area.          |
| <b>XE1ED</b> | <b>Radiation output problem</b><br>Problem with the device's intended output of radiation.                                                                                         |
| <b>XE5F0</b> | Radiation output failure<br>Problem associated with the absence of radiation output from radiological or diagnostic devices.                                                       |

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>XE586</b> | <b>Temperature problem</b><br>Problem associated with the device producing unintended temperatures                                                                                                                                     |
| <b>XE9C7</b> | <b>Excessive cooling</b><br>Problem associated with the device producing temperatures that are lower than specified.                                                                                                                   |
| <b>XE77H</b> | <b>Excessive heating</b><br>Problem associated with the device having a warming or heating function, producing excessive heat.                                                                                                         |
| <b>XE200</b> | <b>Insufficient cooling</b><br>Problem associated with the device insufficiently cooled in device active (working) or/and non-active (nonworking) state.                                                                               |
| <b>XE2A4</b> | <b>Insufficient heating</b><br>Problem associated with the device or its components producing temperatures that are not as high as what is specified.                                                                                  |
| <b>XE14Q</b> | <b>Overheating of device</b><br>Problem associated with the device producing high temperatures, such that its operation is compromised or harm is caused (e.g. overheating that produces melting of components or automatic shutdown). |
| <b>XE6DP</b> | <b>Thermal decomposition of device</b><br>Problems associated with a discoloration or destruction as a result of thermal decomposition of the device.                                                                                  |
| <b>XE5T3</b> | <b>Fire</b><br>Problem associated with the combustion of the device with a steady flame.                                                                                                                                               |
| <b>XE03F</b> | <b>Flare or flash</b><br>Problem associated with device-related burn with an unsteady flame.                                                                                                                                           |
| <b>XE5H5</b> | <b>Smoke</b><br>Problem associated with a cloud of vapor or gas generated from the device, generally associated after a fire or a burn.                                                                                                |
| <b>XE85E</b> | <b>Computer software problem</b><br>Problem associated with written programs, codes, and/or software system that affects device performance or communication with another device.                                                      |
| <b>XE6PS</b> | <b>Application network problem</b><br>Problem associated with the deviations from documented system specifications that affects overall system performance and/or the performance of an individual device connected to that system.    |

|              |                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE8HP</b> | <b>Application program problem</b><br>Problem associated with the requirement for software to fulfill its function within an intended use or application.                                                                  |
| <b>XE5YA</b> | Application program freezes, or becomes nonfunctional<br>Problem associated with freezing and becoming nonfunctional of an application program.                                                                            |
| <b>XE46R</b> | Application program problem, dose calculation error<br>Problem associated with the written program code or application software used by the device to calculate specific measurements or quantities managed by the device. |
| <b>XE09U</b> | Application program problem, medication error<br>Event in which the device software results in errors of medication preparation or administration.                                                                         |
| <b>XE2BJ</b> | Application program problem, parameter calculation error<br>Problem associated with the written program code or application software used by the device to calculate parameters other than those related to dose or power. |
| <b>XE6SW</b> | Application program problem, power calculation error<br>Problem associated with the written program code or application software used by the device for calculations related to device power.                              |
| <b>XE2CW</b> | Application program version or upgrade problem<br>Problem associated with installing updates to a software system that affects the device performance or communication with another device.                                |
| <b>XE5CT</b> | Problem with software installation<br>Problem associated with installing the device software in a manner that allows full functioning of the device. Source of installation could be manufacturer or user.                 |
| <b>XE842</b> | Unintended application program shutdown<br>Problem associated with an unintended shutdown by malfunction of the application program.                                                                                       |
| <b>XE1HG</b> | <b>Program or algorithm execution problem</b><br>Problem associated with execution problems relating to program or algorithm.                                                                                              |
| <b>XE87N</b> | Delayed program or algorithm execution<br>Problem associated with delayed execution relating to program or algorithm.                                                                                                      |
| <b>XE1WW</b> | Intermittent program or algorithm execution<br>Problem associated with intermittent execution relating to program or algorithm.                                                                                            |
| <b>XE0UN</b> | Program or algorithm execution failure<br>Problem associated with the failure of a program or algorithm to execute. Sudden/unexpected interruption to a program's execution.                                               |

|              |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE4Z0</b> | <b>Computer operating system problem</b><br>Problem associated with software, firmware, and/or hardware elements that control the execution of computer programs and provide such services as computer resource allocation, job control, input/output control, and file management in a computer system.                                                                                                              |
| <b>XE5F1</b> | Operating system becomes nonfunctional<br>Problem associated with malfunction of the computer operating system as opposed to an application software problem.                                                                                                                                                                                                                                                         |
| <b>XE6VL</b> | Operating system version or upgrade problem<br>Problem associated with replacing an older operating system to an up-to-date operating system.                                                                                                                                                                                                                                                                         |
| <b>XE5EP</b> | <b>Computer system security problem</b><br>Problem associated with unauthorized access to or modification of a software system resulting in a loss of confidentiality, integrity, or availability of written program code, application software, or data or entire device.                                                                                                                                            |
| <b>XE9XK</b> | Application security problem<br>Problem associated with the acquisition of computer programming codes that can replicate and spread from one computer system to another thereby leading to damaged software, hardware and data.                                                                                                                                                                                       |
| <b>XE15X</b> | Unauthorized access to computer system<br>Problem associated with an access that was not permitted to the computer system that may lead to modification of program, corruption of data, or a break in network security. This concept is closely associated with computer integrity which is the degree to which a system or component prevents unauthorized access to, or modification of, computer programs or data. |
| <b>XE2ZM</b> | <b>Data back-up problem</b><br>Problems relating to a system, component, file, procedure, or person available to replace or help restore a primary item in the event of a failure or externally caused disaster.                                                                                                                                                                                                      |
| <b>XE72G</b> | Failure to back up<br>Problem associated with the inability to back up or to retrieve a backed-up version (corrupted file) of device data or system files.                                                                                                                                                                                                                                                            |
| <b>XE8PZ</b> | Failure to convert to back-up<br>Problem associated with a failure to transition from a primary system, component, file, procedure to a backup in response to a failure in the primary item.                                                                                                                                                                                                                          |
| <b>XE99Y</b> | <b>Data problem</b><br>Event in which data (charting, orders, results) is not correctly stored, transferred, updated, or displayed.                                                                                                                                                                                                                                                                                   |

|              |                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE992</b> | <p>Loss of data</p> <p>Event in which data is unintentionally permanently or temporarily lost, deleted, corrupted, or overwritten.</p>                                                                                                                                          |
| <b>XE7BE</b> | <p>Patient data problem</p> <p>Event in which data is accessed by the healthcare provider and either the wrong patient or the wrong data is retrieved despite correct inquiry procedures.</p>                                                                                   |
| <b>XE048</b> | <p><b>Date or time related software problem</b></p> <p>Problem associated with programming of calendar dates and/or time as a factor in the operation of the device.</p>                                                                                                        |
| <b>XE3UR</b> | <p><b>Connection problem</b></p> <p>Problem associated with linking of the device and/or the functional units set up to provide means for a transfer of liquid, gas, electricity or data.</p>                                                                                   |
| <b>XE9D0</b> | <p><b>Blocked connection</b></p> <p>Problem associated with linking of the device whereby their functional units set up to provide means for a transfer of fluid, gas, or data is prevented or impeded.</p>                                                                     |
| <b>XE74X</b> | <p><b>Decoupling</b></p> <p>Problem associated with the device being unassociated in such a way that fluid, gas, power or signal information may not be transferred from one to another.</p>                                                                                    |
| <b>XE5WZ</b> | <p><b>Disconnection</b></p> <p>Problem associated with the linking of the device having a sufficient open space to prevent gas, liquid or electrical current flow between connectors.</p>                                                                                       |
| <b>XE9HJ</b> | <p><b>Failure to disconnect</b></p> <p>Problem associated with the linking of the device whereby termination of the transfer of liquid, gas, electricity, or information cannot be accomplished, or linking components do not come apart, or disconnect, when expected.</p>     |
| <b>XE3G6</b> | <p><b>Loose or intermittent connection</b></p> <p>Problem associated with the connection of the device being loose or intermittent.</p>                                                                                                                                         |
| <b>XE0WB</b> | <p><b>Misconnection</b></p> <p>Problem associated with the connection of the device being improper or not in accordance with device specification, requirements or intended uses.</p>                                                                                           |
| <b>XE4C0</b> | <p><b>Incomplete or inadequate connection</b></p> <p>Problem associated with a partial linking of the device whereby device may appear to be connected however only a partial, intermittent or no transfer of liquid, gas, electricity, or information can be accomplished.</p> |
| <b>XE0P9</b> | <p><b>Fitting problem</b></p> <p>Problem associated with the connection of the device whereby channels, switching systems, and other functional units set up to provide means for a transfer of liquid, gas, electricity, or information do not match or fit.</p>               |

|              |                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE0JD</b> | <b>Communication or transmission problem</b><br>Problem associated with the device sending or receiving signals or data. This includes transmission among internal components of the device to which the device is intended to communicate.                                                       |
| <b>XE3EG</b> | <b>Failure to read input signal</b><br>Problem associated with a failure of the device to read a signal for interpretation or measurement.                                                                                                                                                        |
| <b>XE0V5</b> | <b>Failure to transmit record</b><br>Problem associated with a failure of the device to transmit a record for interpretation or measurement.                                                                                                                                                      |
| <b>XE4JX</b> | <b>Intermittent communication failure</b><br>Inconsistent or lack of intended communication of data among internal components or with other external devices.                                                                                                                                     |
| <b>XE5H8</b> | <b>Telemetry discrepancy</b><br>Problem associated with variability of the transmission of telemetry signals.                                                                                                                                                                                     |
| <b>XE4YY</b> | <b>Wireless communication problem</b><br>Problems with the RF wireless technology characteristics and performance (e.g., frequency, output power, range, reception), wireless quality of service, wireless coexistence, security of wireless signals and data, and electromagnetic compatibility. |
| <b>XE7NV</b> | <b>Infusion or flow problem</b><br>Problem associated with the device failing to deliver liquids or gases as intended (e.g. delivering drugs at incorrect rate, problems with drawing fluid from a system).                                                                                       |
| <b>XE4VT</b> | <b>Deflation problem</b><br>Problem associated with the inability of the device to release its contents.                                                                                                                                                                                          |
| <b>XE6YH</b> | <b>Excess flow or over-infusion</b><br>Problem associated with a delivery overdose of therapeutic agents, such as drugs or fluids being delivered into a device or a patient.                                                                                                                     |
| <b>XE49K</b> | <b>Filling problem</b><br>Problem associated with the method or amount of time associated with the delivery of a fluid. Time to delivery or amount of delivered entity may be affected.                                                                                                           |
| <b>XE3T4</b> | <b>Inability to auto-fill</b><br>Complete failure to fill as part of an automated process. For insufficient filling use "Short Fill". For excessive filling use "Overfill". For inconsistent filling use "Volume Accuracy Problem".                                                               |

|              |                                                                                                                                                                                                                                                                                                                                         |

**XE1W0****Appropriate term or code not available for aspects of incidents related to devices**

The device problem is not adequately described by any other term.

Note: this code must not be used unless there is no other feasible code. The preferred term should be documented when submitting an adverse event report. This information will be used to determine if a new term should be added to the code table.

## Investigation conclusion of events related to devices

## Findings of investigations related to devices

**XE0WX****Biological problem with device identified**

Problems relating to, caused by or affecting biological processes or living organisms.

**XE5T0****Biocompatibility problem with device identified**

The device causes cellular or tissue responses that elicit an undesirable local or systemic effect in the recipient or beneficiary of that therapy. (See ISO 10993)

| <b>XE546</b> | <b>Impedance problem with device identified</b><br>Problems due to insufficient or excessive resistance to current flow either by the device or circuit.                                                                                                            |
| <b>XE1TX</b> | <b>Insulation problem with device identified</b><br>Problems due to inadequate or incorrect electrical insulation material.                                                                                                                                         |

|              |                                                                                                                                                                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE4PP</b> | <b>Open circuit in device</b><br>Problem due to an electrical circuit that does not conduct current because a switch is open, a wire is broken, etc.                                                                                                                                                         |
| <b>XE2V6</b> | <b>Current leakage problem of device identified</b><br>Problems related to leakage currents which may cause electric shock. These currents usually flow through the protective ground conductor. In its absence, these currents could flow from the device to the ground via the human body.                 |
| <b>XE0KB</b> | <b>Power source problem identified in device</b><br>Problems related to the source that provides electrical power to the device.                                                                                                                                                                             |
| <b>XE4ZM</b> | <b>Energy storage system problem in device</b><br>Problems related to the energy storage system (e.g. the rechargeable battery, charging system, or capacitor) and includes problems such as premature power source depletion and battery explosions.                                                        |
| <b>XE2WJ</b> | <b>Loss of power to device</b><br>A device that experienced problems due to a loss in the power supply.                                                                                                                                                                                                      |
| <b>XE7RB</b> | <b>Power fluctuation in device</b><br>The device failed due to fluctuations within the power supply (e.g. transient power, power spike, power dip, or power sequencing).                                                                                                                                     |
| <b>XE7AB</b> | <b>Short circuit of device</b><br>Problems due to an unintentionally low-resistance connection between two points in an electric circuit, resulting in either excessive current flow that often causes damage or in a new shorter circuit that draws current away from the original pathways and components. |
| <b>XE8KR</b> | <b>Signal loss of device</b><br>Problems due to the loss or weakening of an electrical signal or signals.                                                                                                                                                                                                    |
| <b>XE6AQ</b> | <b>Electromagnetic compatibility problem with device identified</b><br>Device-to-device or device-environment problem resulting from electromagnetic disturbances.                                                                                                                                           |
| <b>XE6BD</b> | <b>Conducted interference with device</b><br>Problems related to electromagnetic interference (EMI) by physical contact with conductors (e.g. wires, resistors, terminals) as opposed to radiated EMI which is caused by induction (without physical contact of the conductors).                             |
| <b>XE8P9</b> | <b>Electrostatic discharge of device</b><br>Problems due to sudden and momentary bursts of electrical current flowing between two objects at different electrical potentials.                                                                                                                                |
| <b>XE2ME</b> | <b>Inadequate immunity of device</b><br>Problems related to immunity or capabilities to resist electromagnetic interference (EMI).                                                                                                                                                                           |

|              |                                                                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE8TZ</b> | <b>Unintended emission of device</b><br>Problems due to unintended emission of electromagnetic energy by the device.                                                                                                                                                                                        |
| <b>XE1LT</b> | <b>Radiofrequency interference with device identified</b><br>Problems due to radiofrequency interference. RFI is a disturbance that affects an electrical circuit due to either electromagnetic conduction or electromagnetic radiation emitted from an external source.                                    |
| <b>XE02N</b> | <b>Interoperability problem with device identified</b><br>Problems with the mechanical, electrical, or communication interface between two or more separate devices.                                                                                                                                        |
| <b>XE6C8</b> | <b>Communications problem with device identified</b><br>Devices that do not send or receive adequate signals (this speaks to the interoperability between devices).                                                                                                                                         |
| <b>XE22K</b> | Wired communication problem with device identified<br>Communications problems between devices within a wired system.                                                                                                                                                                                        |
| <b>XE1PD</b> | Wireless communication problem with device identified<br>Communications problems between devices within a wireless system.                                                                                                                                                                                  |
| <b>XE5NA</b> | Network communication problem with device identified<br>Communications problems between devices within a network system.                                                                                                                                                                                    |
| <b>XE1SP</b> | <b>Incompatible component or accessory of device identified</b><br>A device that malfunctions due to a component(s)/accessory that does not operate correctly and according to the device's specifications.                                                                                                 |
| <b>XE1YT</b> | <b>Labeling and instructions for use or maintenance of device problem identified</b><br>Insufficient, inadequate, or incorrect information provided on a device's label or documentation regarding e.g. its intended use, directions for use, and characteristics of the device, including its maintenance. |
| <b>XE3PV</b> | <b>Inadequate labelling or instructions for use of device identified</b><br>Inadequate information on the labels or in the instructions for use e.g. steps that are difficult to follow or that are missing.                                                                                                |
| <b>XE4MR</b> | <b>Incorrect labelling or instructions for use of device identified</b><br>Missing, incorrect, or inappropriate information on the labels e.g. mislabeled contents or device labeling characteristics or package contents.                                                                                  |
| <b>XE7Y7</b> | <b>Inadequate or incorrect instructions for maintenance of device identified</b><br>Inadequate or incorrect information in the instructions for maintenance.                                                                                                                                                |
| <b>XE3RW</b> | <b>Material or chemical problem with device identified</b><br>Problems with the device materials or how its materials react to other elements either within the device or within the environment.                                                                                                           |

|              |                                                                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE2H0</b> | <b>Degradation problem identified with device</b><br>Problems that occur when the device becomes worn, weakened, corroded, or broken down due to processes such as aging, permeation, and corrosion.                              |
| <b>XE2WT</b> | <b>Inappropriate material identified in device</b><br>Problems that occur due to the presence of a material that should not be present or part of the device.                                                                     |
| <b>XE60T</b> | <b>Inadequate physicochemical properties identified in device</b><br>Problems that occur due to the physicochemical properties.                                                                                                   |
| <b>XE4EB</b> | <b>Incompatible material identified in device</b><br>Problems that occur due to the incompatibility of materials that co-exist simultaneously as part of the device.                                                              |
| <b>XE25Z</b> | <b>Reactivity problem identified with device</b><br>Problems that occur due to the reactivity of materials (e.g. over-react or under-react).                                                                                      |
| <b>XE6U0</b> | <b>Tolerance stack-up identified in device</b><br>Problems that result from a combination of specification variances of the components.                                                                                           |
| <b>XE640</b> | <b>Mechanical problem with device identified</b><br>Problems that result from internal or external forces including fluids, other objects, or environmental or physiologic influences.                                            |
| <b>XE8RU</b> | <b>Device migration identified</b><br>A device that has moved from its original location due to external forces (e.g. stent or lead movement).                                                                                    |
| <b>XE3HZ</b> | <b>Friction problem identified with device</b><br>Problems caused by its surface coming in contact with another surface or fluid.                                                                                                 |
| <b>XE1P8</b> | <b>Leakage or seal problem identified with device</b><br>Problems caused by inadequate/broken seal within the device.                                                                                                             |
| <b>XE6UT</b> | <b>Lubrication problem identified with device</b><br>Problems that occurred because of the presence of either too much or too little lubricant where required (e.g. connectors, leading to failure mechanisms such as corrosion). |
| <b>XE69Q</b> | <b>Stiffness problem identified with device</b><br>Problems caused by either excessive or inadequate physical force exerted on it by another object resulting in problems e.g. wear, bending, deformation, fracture, fatigue.     |

|              |                                                                                                                                                                                                                                                        |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE8V5</b> | <b>Stress problem with device identified</b><br>Problems caused by either excessive or inadequate physical force exerted on it by another object resulting in problems e.g. wear, bending, deformation, fracture, fatigue.                             |
| <b>XE0WG</b> | <b>Deformation problem with device identified</b><br>Problems caused by changes in the shape or size of the device due to an applied force. This can be a result of tensile forces, compressive forces, shear, bending, tensile (pulling), or torsion. |
| <b>XE3Y4</b> | <b>Fatigue problem with device identified</b><br>Problems due to the weakening or breakdown of its material when subjected to stress or a series of repeated stresses.                                                                                 |
| <b>XE1ZP</b> | <b>Fracture problem with device identified</b><br>Problems caused by the separation of a component, object, or material into two or more pieces including shear.                                                                                       |
| <b>XE1UJ</b> | <b>Mechanical shock problem with device identified</b><br>Problems caused by the sudden violent blow or collision to the whole device (e.g. by dropping).                                                                                              |
| <b>XE1H3</b> | <b>Vibration problem with device identified</b><br>Problems caused by the constant rhythmic motion of the device, or something in the environment to which the device is exposed.                                                                      |
| <b>XE1ZQ</b> | <b>Wear problem with device identified</b><br>Problems due to the premature or expected erosion of its material by use, deterioration, or change.                                                                                                      |
| <b>XE1EJ</b> | <b>Incorrect dimension of device identified</b><br>Problems caused by incorrect physical dimensions of the device or one of its parts                                                                                                                  |
| <b>XE4KN</b> | <b>Optical problem with device identified</b><br>Problems related to the optical properties of a device.                                                                                                                                               |
| <b>XE42B</b> | <b>Optical transmission problem identified with device</b><br>Problems with the device's ability to pass light energy.                                                                                                                                 |

| <b>XE2YD</b> | <b>Patient sample problem with device identified</b><br>Problems that occurred due to endogenous or exogenous interferent in the sample, or unexpected variation in the target analyte/marker.                                                                        |
| <b>XE8DL</b> | <b>New or unknown interferent problem with device identified</b><br>New or unknown endogenous or exogenous interferent (sample) identified.                                                                                                                           |
| <b>XE9C0</b> | <b>Known interferent problem with device identified</b><br>Known interferent in the sample identified.                                                                                                                                                                |
| <b>XE83B</b> | <b>Pre-analytical handling problem with device identified</b><br>Incorrect pre-analytical handling of patient's sample by the user.                                                                                                                                   |
| <b>XE3AL</b> | <b>Environment problem with device identified</b><br>Problems that occurred due to factors within the environment e.g. dust, dirt, humidity, temperature.                                                                                                             |
| <b>XE5K2</b> | <b>Environmental temperature problem with device identified</b><br>Device performance was affected by the temperature, or changes in temperature, of the environment in which it was used.                                                                            |
| <b>XE9HK</b> | <b>Dust or dirt problem with device identified</b><br>A device that experienced problems due to ingress, or coating, of dust or dirt.                                                                                                                                 |
| <b>XE2VF</b> | <b>Contamination of environment by device identified</b><br>Operation of the device results in contamination of the nearby environment e.g. dust, dirt, smoke, heat or biological material.                                                                           |
| <b>XE6QW</b> | <b>Environmental pressure problem with device identified</b><br>Device performance was affected by the pressure, or changes in pressure, of the environment in which it was used.                                                                                     |
| <b>XE5SF</b> | <b>Ambient light problem with device identified</b><br>Device performance was affected by ambient light.<br><br>This term applies to the direct effects of ambient light on the device, and to the user's ability to operate the device (e.g. to read device output). |

|              |                                                                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE4V1</b> | <b>Environmental humidity problem with device identified</b><br>Device performance was affected by the humidity, or changes in humidity, of the environment in which it was used.                                                                                                      |
| <b>XE205</b> | <b>Manufacturing process problem with device identified</b><br>Problems with a device that can be traced to a problem in the manufacturing and/or production process.                                                                                                                  |
| <b>XE3NF</b> | <b>Assembly problem with device identified</b><br>Problems that occurred because the device was assembled incorrectly.                                                                                                                                                                 |
| <b>XE00F</b> | <b>Sterilization problem with device identified</b><br>Problems that occurred during terminal sterilization by the manufacturer.                                                                                                                                                       |
| <b>XE1PG</b> | <b>Installation problem with device identified</b><br>A device that malfunctions because it was incorrectly installed, set up, or configured (E.g. misconfiguration of an "automatic" defibrillator to "semi-automatic", thereby leading to failure).                                  |
| <b>XE843</b> | <b>Maintenance of manufacturing machinery problem with device identified</b><br>Problems caused by failure to maintain manufacturing equipment used to produce the device.                                                                                                             |
| <b>XE278</b> | <b>Packaging problem with device identified</b><br>Problems that occurred because of the device packaging.                                                                                                                                                                             |
| <b>XE9F7</b> | Packaging of device compromised problem identified<br>Problems that occurred because of a compromised packaging of the device (e.g. broken or incomplete seal).                                                                                                                        |
| <b>XE0KG</b> | Packaging materials of device problem identified<br>Problems that occurred because the composition or type of packaging materials was inappropriate for the device.                                                                                                                    |
| <b>XE8S1</b> | Packaging of device contains unintended material problem identified<br>Problems that occurred because unintended material was packaged with the device.                                                                                                                                |
| <b>XE8TA</b> | Packaging contains incorrect device problem identified<br>Problems that occurred because the packaging contained an incorrect device.                                                                                                                                                  |
| <b>XE6LZ</b> | <b>Maintenance problem with device identified</b><br>A device malfunction or problem that occurs after production because the device was not properly maintained according to the instructions (e.g. maintenance may be performed by user facility, distributor, or service provider). |
| <b>XE9VK</b> | <b>Transport or storage problem with device identified</b><br>Problems caused by transport or storage conditions.                                                                                                                                                                      |

|              |                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE32G</b> | <b>Storage of device problem identified</b><br>Problems that result from storing the device in an uncontrolled or improper environment (e.g. moisture sensitive devices stored in a humid environment).                                                                                                                                                                                        |
| <b>XE41R</b> | <b>No device problem found</b><br>The device either functioned as intended or a problem was not found.                                                                                                                                                                                                                                                                                         |
| <b>XE587</b> | <b>No findings available</b><br>Use when no investigation can be performed and therefore no results will be obtained.                                                                                                                                                                                                                                                                          |
| <b>XE3PA</b> | <b>Results pending completion of investigation</b><br>Investigation is ongoing and results are not yet available. Do not use this code if the investigation is complete.                                                                                                                                                                                                                       |
| <b>XE3WR</b> | <b>Appropriate term or code for investigation of device not available</b><br>Problems not adequately described by any other term.<br><br>Note: This code must not be used unless there is no other feasible code. The preferred term should be documented when submitting an adverse event report. This information will be used to determine if a new term should be added to the code table. |

#### Cause investigation and type of investigation

For describing what was investigated and what kind of investigation was conducted to specify the root cause of the adverse event.

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE9HD</b> | <b>Testing of actual or suspected device</b><br>The investigation employed relevant empirical testing of the actual device suspected in the reported adverse event in order to establish their functional and other properties and to identify possible causes for the adverse event. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.                                                                                                                               |
| <b>XE7XH</b> | <b>Testing of device from same lot or batch retained by manufacturer</b><br>The investigation employed relevant empirical testing of the device of the same lot or batch as that of the suspected device in the reported adverse event in order to support the identification of possible causes for the adverse event. Testing was performed using the device retained by the manufacturer (i.e. was not shipped). Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards. |
| <b>XE4S0</b> | <b>Testing of device from same lot batch returned from user</b><br>The investigation employed relevant empirical testing of the device of the same lot or batch as that of the suspected device in the reported adverse event in order to support the identification of possible causes for the adverse event. The device was returned from the user. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.                                                               |

**XE2ZR****Testing of device from other lot batch retained by manufacturer**

The investigation employed relevant empirical testing of the device of another lot or batch than that of the suspected device in the reported adverse event in order to support the identification of possible causes for the adverse event. This includes devices without a lot/batch designation. Testing was performed using the device retained by the manufacturer (i.e. was not shipped). Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.

**XE4X1****Testing of device from other lot or batch returned from user**

The investigation employed relevant empirical testing of the device of another lot or batch than that of the suspected device in the reported adverse event in order to support the identification of possible causes for the adverse event. This includes devices without a lot/batch designation. The device was returned from the user. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the technical file. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.

**XE1XT****Testing of model variant**

The investigation employed relevant empirical testing of a model variant of the device involved in the reported adverse event in order to support the identification of possible causes for the adverse event through plausibility reasoning. A model variant is not identical to the actual device, but shares relevant characteristics with the device involved. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.

**XE8XV****Testing of raw or starting materials**

The investigation employed relevant empirical testing of the materials used in construction of the device involved in the reported adverse event in order to support the identification of possible causes for the adverse event. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.

**XE6FS****Testing of patient sample or reference material using manufacturer's device**

The investigation employed relevant empirical testing of a patient sample or reference material using the device (usually an IVD) involved in the reported adverse event in order to support the identification of possible causes for the adverse event. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.

**XE9MY****Testing of patient sample or reference material using reference method**

The investigation employed relevant empirical testing of a patient sample or reference material using an appropriate reference method to the device (usually an IVD) involved in the reported adverse event in order to support the identification of possible causes for the adverse event. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.

**XE89L**

**Testing of patient sample or reference material using competitor's device**

The investigation employed relevant empirical testing of a patient sample or reference material using a competitor's device that is comparable to the device (usually an IVD) involved in the reported adverse event in order to support the identification of possible causes for the adverse event. Relevant testing would typically be based on test methods used for evaluating safety and performance as described in the latest relevant standards.

**XE8UH**

**Historical data analysis**

The investigation involved the analysis of historical adverse events data of the actual device involved in the adverse event and/or of products from the same and/or different batches/lots.

**XE8BM**

**Trend analysis**

The investigation involved trend analysis of adverse event of the actual device involved in the adverse event and/or of products from the same and/or different batches/lots. It should be noted that trend analysis typically is not considered sufficient as a stand-alone method, but should be used in conjunction with other investigation methods for providing for instance complementary information.

**XE7GK**

**Communication or interviews**

The investigation involved communication/interviews (either interpersonal or through technical means, e.g. phone, e-mail) with persons close to the adverse event, e.g. healthcare professionals (doctors, nurses etc.), the affected patient(s) or other users including, where appropriate, relatives or others engaged in caring for the affected patient.

**XE4KV**

**Analysis of production records**

The investigation involved the analysis of relevant production records in view of supporting the identification of possible causes for the adverse event.

**XE59M**

**Analysis of data provided by user or third party**

The investigation involved the analysis of relevant data provided by the user (e.g. healthcare professional, patient, clinical engineer) or a third party (e.g. testing facility) in view of supporting the identification of possible causes for the adverse event.

**XE8FB**

**Device not manufactured by reporting manufacturer**

Further information was obtained which established that the manufacturer of the device involved was not the one to which it was initially attributed.

**XE970**

**Device not returned**

The actual device involved in the adverse event was not returned for testing despite requests by manufacturer.

**XE18W**

**Device discarded**

The actual device involved in the adverse event had been already discarded and thus irretrievably lost for testing.

**XE5AN**

**Incomplete device returned**

The device was returned incompletely, lacking parts, components or accessories that would be required for appropriate testing and analysis of root causes.

**XE53L**

**Device not accessible for testing**

The actual device involved in the adverse event is not readily accessible for testing (e.g. remains implanted in patient).

**XE6Q2**

**Type of investigation not yet determined**

Details to determine the type of investigation are not yet available, but are being sought. Do not use this code if the investigation is complete.

**XE3TW**

**Insufficient information available**

The information available relating to the reported event is not sufficient to identify either the manufacturer, the device, or other essential information. This term indicates that no further investigation is possible. Do not use this code if further information is being sought, instead use "Type of investigation not yet determined".

Medical device component

Terms/codes for describing the parts and components which were involved in, or affected by, the medical device adverse event/incident.

Biological and chemical medical device component

Component whose mode of action involves a biological process (e.g. test strip which acts on antibodies) and chemical reaction or transformation (e.g. activated charcoal absorber).

**XE8XD**

**Absorber component of medical device**

A component or material designed to take in or attenuate a substance.

**XE6Z7**

**Cautery tip component of medical device**

A component designed to coagulate and seal blood vessels or to destroy tissue with heat or electric current.

**XE7JR**

**Device ingredient or reagent component of medical device**

A consumable material that is added to a device and is used to make a finished product or becomes part of a finished product.

**XE8HT**

**Gas scavenging component of medical device**

A component designed to remove certain gases from a gas stream or environment.

**XE4VK**

**Monomer liquid component of medical device**

The liquid that reacts with the polymer powder to form adhesive, resin, or cement.

**XE68H**

**Test strip component of medical device**

A piece of chemically treated medium designed to react in the presence of specific amounts of a trigger substance.

**XE7WP**

**Polymer powder component of medical device**

The powder that reacts with the monomer liquid to form adhesive, resin, or cement.

**Electrical and magnetic medical device component**

Components which relate to the force of magnetism or such as microchips and transistors which control and direct electric currents. Also includes components involved in the representation, storage, or transmission of information by electronic systems.

**XE321**

**Antenna component of medical device**

A component designed to transmit or receive electromagnetic signals.

**XE3WM**

**Battery component of medical device**

A component designed to produce an electric current through chemical reaction.

**XE80Z**

**Battery charger component of medical device**

A device designed to restore the capacity of a battery.

**XE7JQ**

**Cable, electrical component of medical device**

A long, thin, multistranded electrical wire designed to carry signals or power over a distance.

**XE77B**

**Cable grip component of medical device**

Component used for tensioning, pulling or stringing of wires and cables.

**XE2BS**

**Cable sleeve component of medical device**

Component used to protect cables and wires from abrasion, moisture and the elements.

**XE2WY**

**Circuit board component of medical device**

A non-conducting board with conductive tracks and electronic components forming a circuit.

**XE5BT**

**Circuit breaker component of medical device**

A component designed to open an electrical circuit when it becomes overloaded.

**XE2ZE**

**Computer hardware component of medical device**

The physical components from which a computer is constructed (electronic circuits and input/output devices).

**XE3Q8**

**Computer processor component of medical device**

Component that carries out the instructions of a computer program by performing the basic arithmetic, logic, controlling, and input/output operations specified by the instructions.

**XE1JS**

**Memory or storage component of medical device**

Any component that can hold data in machine-readable format.

|              |                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE2YC</b> | <b>Network interface component of medical device</b><br>Point of interconnection between a computer and other computer that are linked each other.                                   |
| <b>XE8UU</b> | <b>Computer software component of medical device</b><br>A collection of data or computer instructions that tell the computer how to work.                                            |
| <b>XE59Z</b> | <b>Computer software driver component of medical device</b><br>A computer interface designed to control the interaction between a CPU and a peripheral device.                       |
| <b>XE2JQ</b> | <b>Software interface component of medical device</b><br>Languages, codes and messages that programs use to communicate with each other and to the hardware.                         |
| <b>XE8V6</b> | <b>User interface component of medical device</b><br>A computer program that controls the interaction between a user and a system.                                                   |
| <b>XE7P0</b> | <b>Cooling module component of medical device</b><br>A component designed to lower the temperature of a device or system.                                                            |
| <b>XE8UV</b> | <b>Device programmer component of medical device</b><br>A piece of hardware for transferring data onto programmable integrated circuits.                                             |
| <b>XE033</b> | <b>Device reader component of medical device</b><br>A piece of hardware used to read the memory and the properties of a device.                                                      |
| <b>XE6UE</b> | <b>Discrete electrical component of medical device</b><br>An electrical component which is just one circuit, either passive or active, that is not an integrated circuit.            |
| <b>XE845</b> | <b>Electrical capacitor component of medical device</b><br>An electrical component designed to store an electric charge.                                                             |
| <b>XE38E</b> | <b>Electrical fuse component of medical device</b><br>An electrical component designed to stop the flow of current when an overload condition exists.                                |
| <b>XE1UQ</b> | <b>Electrical inductor component of medical device</b><br>A component designed to introduce electromotive force to a circuit, usually a coil surrounding a wire.                     |
| <b>XE2AJ</b> | <b>Electrical resistor component of medical device</b><br>An electronic component that opposes the flow of current.                                                                  |
| <b>XE4VJ</b> | <b>Electrical solenoid component of medical device</b><br>An electronic component consisting of a coil surrounding a movable iron core that is designed to act as a switch or relay. |

|              |                                                                                                                                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE018</b> | <b>Electrical transducer component of medical device</b><br>An electrical component that converts one form of energy into another.                                                                                                       |
| <b>XE27R</b> | <b>Electrical semiconductor component of medical device</b><br>A type of electronic component, including transistors and diodes, that make use of the variable conductivity of certain materials.                                        |
| <b>XE9ZW</b> | <b>Integrated circuit chip component of medical device</b><br>A microelectronic circuit that incorporates many interconnected transistors and other components.                                                                          |
| <b>XE8GY</b> | <b>Display component of medical device</b><br>A component designed to present information visually.<br><b>Exclusions:</b> Touchscreen component of medical device (XE9ZJ)                                                                |
| <b>XE4YD</b> | <b>Display indicator component of medical device</b><br>A component designed to show an operating condition of a system or to attract attention.                                                                                         |
| <b>XE2JV</b> | <b>Display screen component of medical device</b><br>A panel or area on an electronic device where images and data are displayed.                                                                                                        |
| <b>XE59E</b> | <b>Electrical lead or wire component of medical device</b><br>A coated or uncoated wire used to connect two locations electronically. Not to be used for patient connection.                                                             |
| <b>XE5U9</b> | <b>Electrode component of medical device</b><br>A small piece of metal or other conductive substance that is used to take an electric current to or from a source of power, a piece of equipment. Not to be used for patient connection. |
| <b>XE561</b> | <b>Ground strap or wire component of medical device</b><br>A wire cable or strap designed to carry current safely away from an electronic device under fault condition                                                                   |
| <b>XE753</b> | <b>Wiring harness component of medical device</b><br>A collection of grouped wires or cables designed to connect to a specific device.                                                                                                   |
| <b>XE6S4</b> | <b>Electrical mixer component of medical device</b><br>An electronic component designed to blend signals.                                                                                                                                |
| <b>XE0Y5</b> | <b>Electrical port component of medical device</b><br>An electronic circuit that acts as a connection to another device or component.                                                                                                    |
| <b>XE2PX</b> | <b>Emitter component of medical device</b><br>The electron source electrode in a transistor or any source in a system.                                                                                                                   |

|              |                                                                                                                                                                                                                                                            |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE5GC</b> | <b>Headphone or headset component of medical device</b><br>A component that covers the ear through which you can listen without other people hearing. Some headphones come with a microphone which is used to communicate with other people or the device. |
| <b>XE9TB</b> | <b>Heater component of medical device</b><br>A piece of equipment used to raise the temperature of air, gas or water or an object.                                                                                                                         |
| <b>XE713</b> | <b>Hub component of medical device</b><br>An electronic component designed as a central connection for other devices or components.                                                                                                                        |
| <b>XE8JV</b> | <b>Inverter component of medical device</b><br>An electrical component that converts direct current to alternating current.                                                                                                                                |
| <b>XE4BN</b> | <b>Magnet component of medical device</b><br>A component that attracts iron and produces a magnetic field.                                                                                                                                                 |
| <b>XE7YS</b> | <b>Oscillator component of medical device</b><br>An electronic component designed to produce a wave signal.                                                                                                                                                |
| <b>XE525</b> | <b>Patient lead component of medical device</b><br>An insulated electrical cable designed to connect to an electrical device to a patient.                                                                                                                 |
| <b>XE7F1</b> | <b>Lead conductor component of medical device</b><br>A cable designed to conduct electricity from the device to the lead.                                                                                                                                  |
| <b>XE25C</b> | <b>Patient electrode component of medical device</b><br>An electrical conductor that is designed to make contact with a patient including defibrillator paddles.                                                                                           |
| <b>XE4XJ</b> | <b>Power cord component of medical device</b><br>A flexible cable designed to connect an electrical device to a power outlet.                                                                                                                              |
| <b>XE4Q4</b> | <b>Power supply component of medical device</b><br>Component designed to supply electrical power to devices.                                                                                                                                               |
| <b>XE7EJ</b> | <b>Pressure transducer probe component of medical device</b><br>A probe component designed to convert a change in pressure into a varying electrical signal.                                                                                               |
| <b>XE062</b> | <b>Printer component of medical device</b><br>An electronic component that is designed to transfer text or images to paper or other substrate.                                                                                                             |
| <b>XE2KA</b> | <b>Receiver component of medical device</b><br>An electronic component designed to capture an incoming electromagnetic signal and convert it to an audible or visual signal.                                                                               |

|              |                                                                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE6SG</b> | <b>Receiver stimulator unit component of medical device</b><br>As part of a cochlear implant, an implanted component designed to receive signal from the external component and then decode the signal and transmit it to the brain.      |
| <b>XE4TH</b> | <b>Scanner component of medical device</b><br>An electronic component that generates a digital representation of an image for data input to a computer; or a receiver designed to search for a signal within a specified frequency range. |
| <b>XE0ST</b> | <b>Speaker or sounder component of medical device</b><br>A component designed to convert electrical signals to sounds that can be heard.                                                                                                  |
| <b>XE5R5</b> | <b>Switch or relay component of medical device</b><br>A mechanical or electronic component designed to break or change the connections in a circuit (e.g. button).                                                                        |
| <b>XE1EF</b> | <b>Power switch component of medical device</b><br>A switch designed to regulate the power to a device.                                                                                                                                   |
| <b>XE4QR</b> | <b>Relay component of medical device</b><br>A electronic component designed to break or change the connections in a circuit.                                                                                                              |
| <b>XE884</b> | <b>Telemetry component of medical device</b><br>Component designed to transmit and receive data from a remote source using telecommunications methods.                                                                                    |
| <b>XE30P</b> | <b>Temperature compensator component of medical device</b><br>A component designed to compensate the temperature of one system in response to temperature changes in another system or the environment.                                   |
| <b>XE56F</b> | <b>Thermostat component of medical device</b><br>A component designed to regulate temperature by controlling the starting and stopping of a heating/cooling system.                                                                       |
| <b>XE256</b> | <b>Transformer component of medical device</b><br>A component that either steps up or steps down an alternating electrical current to an output that is suitable for another electrical device or component.                              |
| <b>XE579</b> | <b>Transmitter component of medical device</b><br>A component to propagate electromagnetic waves.                                                                                                                                         |
| <b>XE5A0</b> | <b>User input device component of medical device</b><br>A component that uses a movable handle to create two-axis input to a computer.                                                                                                    |
| <b>XE9TZ</b> | <b>Joystick component of medical device</b><br>A control component that uses a movable handle to create two-axis input to a computer.                                                                                                     |

|              |                                                                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE6CN</b> | <b>Keyboard or keypad component of medical device</b><br>A component consisting of mechanical keys that are pressed to create input to a computer. |
| <b>XE9FY</b> | <b>Microphone component of medical device</b><br>A component designed to convert sound to an electrical signal.                                    |
| <b>XE9ZJ</b> | <b>Touchscreen component of medical device</b><br>A control component that operates the device following pressing the display on the screen.       |

## Measurement medical device component

Component capable of measuring something in order to obtain a result.

|              |                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE37A</b> | <b>Analyzer component of medical device</b><br>Any component designed to perform an analysis.                                                                                     |
| <b>XE0A7</b> | <b>Oxygen analyzer component of medical device</b><br>A component designed to measure the concentration of oxygen in a gas mixture.                                               |
| <b>XE6E8</b> | <b>Aperture component of medical device</b><br>An instrument designed to measure the size of an opening or one used to increase the diameter of an opening.                       |
| <b>XE34X</b> | <b>Calibrator component of medical device</b><br>A standard or reference material used to set the operating parameters of an instrument.                                          |
| <b>XE06B</b> | <b>Clock component of medical device</b><br>A component designed to indicate the time of day.                                                                                     |
| <b>XE9NB</b> | <b>Counter component of medical device</b><br>A component designed to keep track of the number of times something happens.                                                        |
| <b>XE20X</b> | <b>Curvette component of medical device</b><br>A clear container designed to interface with an optical sensor in order to obtain an optical measurement of a contained substance. |
| <b>XE00B</b> | <b>Gauges or meters component of medical device</b><br>A component designed to give a visual indication of the condition of a system.                                             |
| <b>XE1WJ</b> | <b>Flowmeter component of medical device</b><br>A component designed to measure the flow rate of a fluid.                                                                         |
| <b>XE6V2</b> | <b>Manometer component of medical device</b><br>A component designed to measure pressure.                                                                                         |

|              |                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE019</b> | <b>Thermometer component of medical device</b><br>A component designed to measure temperature.                                                                                    |
| <b>XE8RD</b> | <b>Marker component of medical device</b><br>A visual indicator of position, place or route, including radiopaque markers.                                                        |
| <b>XE7MS</b> | <b>Pipette component of medical device</b><br>A measuring component, traditionally including a graduated tube, designed for the accurate transfer of liquid volumes.              |
| <b>XE5UB</b> | <b>Pointer component of medical device</b><br>An indicator component designed to show a position on a scale.                                                                      |
| <b>XE2MH</b> | <b>Scale component of medical device</b><br>A component designed for weighing or an indicator component with a graduated sequence of divisions.                                   |
| <b>XE8GP</b> | <b>Sensor component of medical device</b><br>A component designed to respond to a stimulus by generating a signal that can be measured or interpreted.                            |
| <b>XE5Q2</b> | <b>Bubble sensor component of medical device</b><br>A component designed to signal the presence of bubbles in a system.                                                           |
| <b>XE5ZD</b> | <b>Oxygen sensor component of medical device</b><br>A sensor designed to respond to the presence or level of oxygen in a space or environment.                                    |
| <b>XE9G5</b> | <b>Photodetector component of medical device</b><br>A component designed to detect light.                                                                                         |
| <b>XE5WR</b> | <b>Pressure sensor component of medical device</b><br>A sensor designed to respond to the level of pressure in a space or pressing on a surface.                                  |
| <b>XE7Q4</b> | <b>Sensor probe component of medical device</b><br>A component designed to reach into a location for sensing. Should be used when the problem involves the probe, not the sensor. |
| <b>XE3W9</b> | <b>Temperature sensor component of medical device</b><br>A sensor designed to respond to the temperature of a space, surface, or environment.                                     |
| <b>XE3R3</b> | <b>Timer component of medical device</b><br>A component designed to measure a time interval.                                                                                      |

## Mechanical medical device component

Component of a device when it is working, often using power from an engine or from electricity.

|              |                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE3UX</b> | <b>Access port component of medical device</b><br>A component designed for the introduction or removal of medical equipment or any substance.                        |
| <b>XE0WZ</b> | <b>Actuator component of medical device</b><br>A component which moves or controls a mechanism or system.                                                            |
| <b>XE0SV</b> | <b>Adaptor component of medical device</b><br>A component designed to make different pieces of apparatus compatible.                                                 |
| <b>XE6D6</b> | <b>Air eliminator component of medical device</b><br>A component designed to remove air from a space or fluid.                                                       |
| <b>XE4F2</b> | <b>Anchor component of medical device</b><br>A component designed to fix the device or a portion of the device in place.                                             |
| <b>XE94Y</b> | <b>Applicator component of medical device</b><br>A component designed to transfer a substance to a surface.                                                          |
| <b>XE968</b> | <b>Automatic injection system component of medical device</b><br>A system designed to pump a gas or liquid into a space or environment without outside intervention. |
| <b>XE7E4</b> | <b>Bag component of medical device</b><br>A flexible container, often with a single opening.                                                                         |
| <b>XE0HN</b> | <b>Ball component of medical device</b><br>Any component that is spherical in shape.                                                                                 |
| <b>XE5AV</b> | <b>Balloon component of medical device</b><br>A sac designed to be inflated and deflated.                                                                            |
| <b>XE1G8</b> | <b>Bearings component of medical device</b><br>A point of contact between moving parts designed for support or to reduce friction.                                   |
| <b>XE0Y2</b> | <b>Potting component of medical device</b><br>The resin, glue or other substance used to seal other components together.                                             |
| <b>XE46S</b> | <b>Probe component of medical device</b><br>A component designed to reach into a location for manipulating or for measuring.                                         |

|              |                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE23M</b> | <b>Processor component of medical device</b><br>A component designed for preparing or treating a material. Should not be used for computer processors.<br><i><b>Exclusions:</b></i> Computer processor component of medical device (XE3Q8) |
| <b>XE9DJ</b> | <b>Pulley component of medical device</b><br>A component which changes the direction of a force (e.g. belt or chain).                                                                                                                      |
| <b>XE0K1</b> | <b>Pump component of medical device</b><br>A component designed to facilitate the movement of a fluid.                                                                                                                                     |
| <b>XE8RF</b> | <b>Pusher component of medical device</b><br>A component designed to advance something by pushing it.                                                                                                                                      |
| <b>XE76K</b> | <b>Ratchet component of medical device</b><br>A part that allows or forces another part's movement in a single direction.                                                                                                                  |
| <b>XE4JZ</b> | <b>Rail component of medical device</b><br>A bar designed for support, attachment, guidance, or protection from falling.                                                                                                                   |
| <b>XE0KN</b> | <b>Side rail component of medical device</b><br>A supportive or protective rail attached to the side of something.                                                                                                                         |
| <b>XE6YN</b> | <b>Regulator component of medical device</b><br>A component designed to control a process or condition.                                                                                                                                    |
| <b>XE65T</b> | <b>Reservoir component of medical device</b><br>A vessel designed to store a fluid.                                                                                                                                                        |
| <b>XE1XK</b> | <b>Bellows component of medical device</b><br>A component that expands and contracts to draw in air through a valve or orifice and expels it through a tube.                                                                               |
| <b>XE7DG</b> | <b>Ring component of medical device</b><br>A circular band-shaped component.                                                                                                                                                               |
| <b>XE017</b> | <b>Rod or shaft component of medical device</b><br>A long cylindrical bar used to transmit motion or connect other components.                                                                                                             |
| <b>XE4BJ</b> | <b>Seal component of medical device</b><br>A component designed to prevent passage of material through a joint or opening.                                                                                                                 |
| <b>XE7N2</b> | <b>Shock absorber component of medical device</b><br>A mechanical component designed to dampen or attenuate a force.                                                                                                                       |
| <b>XE7ZG</b> | <b>Sleeve component of medical device</b><br>A cylindrical fitting that slides over another part of a device or other object.                                                                                                              |

**XE6VJ**

**Slide component of medical device**

A flat rectangular piece of glass on which specimens can be mounted for microscopic study.

**XE740**

**Socket component of medical device**

A component designed as an opening into which something else fits.

**XE4DU**

**Spacer component of medical device**

A component designed to position objects further apart.

**XE7QZ**

**Spring component of medical device**

An elastic component designed to bend under a load and then return to its shape when unloaded.

**XE4K0**

**Stand component of medical device**

A support component designed to hold an object.

**XE9CF**

**Belt component of medical device**

A component consisting of a narrow band of material moving over shafts or pulleys.

**XE82E**

**Steering wire component of medical device**

A wire designed to enable a device to be maneuvered.

**XE7UE**

**Stent component of medical device**

Tubular support placed inside a blood vessel, canal, or duct to aid healing or relieve an obstruction.

**XE8M4**

**Stopcock component of medical device**

A rotating component designed to act like a tap for regulating the flow of a fluid, and to completely stop the flow when closed fully.

**XE00C**

**Stopper component of medical device**

Component designed to close an opening.

**XE4E4**

**Strain relief component of medical device**

A structure designed to function with a connector to prevent damage to a hose or cable from excess flexing.

**XE3GN**

**Stylet component of medical device**

A thin metal wire designed to be passed through a needle, catheter, or cannula to stiffen it or clear it of debris.

**XE05P**

**Syringe component of medical device**

A component designed as a rigid cylinder with a plunger at one end and a delivery opening at the other.

|              |                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE3ED</b> | <b>Table component of medical device</b><br>A component having a smooth flat surface that is usually supported by one or more vertical legs.                                                                                         |
| <b>XE06W</b> | <b>Tip component of medical device</b><br>Pointed or rounded end of an object.                                                                                                                                                       |
| <b>XE6GE</b> | <b>Tool component of medical device</b><br>A component that is delivered with a device to support its assembly or operation, and is not part of the device. Use only in the case there are no other terms to describe the component. |
| <b>XE7G4</b> | <b>Bottle component of medical device</b><br>A rigid or semi-rigid container used to store liquid.                                                                                                                                   |
| <b>XE0UG</b> | <b>Translational motion component of medical device</b><br>A rotating part which is intended to transfer rotational movement or motion to another type of movement (e.g. excenters).                                                 |
| <b>XE2FM</b> | <b>Trap component of medical device</b><br>A component designed to capture or remove bubbles or fluid.                                                                                                                               |
| <b>XE4M3</b> | <b>Trocar component of medical device</b><br>A sharp, pointed rod designed to pierce the wall of a body cavity to withdraw fluid or allow placement of a catheter or other device.                                                   |
| <b>XE8TY</b> | <b>Tube component of medical device</b><br>A long hollow cylinder, either rigid or flexible, for holding or transporting liquids or gasses.                                                                                          |
| <b>XE2PZ</b> | <b>Capillary tube component of medical device</b><br>A narrow tube in which a liquid flows up against gravity.                                                                                                                       |
| <b>XE01P</b> | <b>Valve component of medical device</b><br>A mechanical component designed to control the flow of a fluid or gas.                                                                                                                   |
| <b>XE3YJ</b> | <b>Control valve component of medical device</b><br>A valve designed to regulate the flow of a fluid or gas.                                                                                                                         |
| <b>XE229</b> | <b>Luer valve component of medical device</b><br>A valve that incorporates a Luer fitting.                                                                                                                                           |
| <b>XE2LS</b> | <b>One-way valve component of medical device</b><br>A valve designed to allow flow in only one direction.                                                                                                                            |
| <b>XE6MT</b> | <b>Vaporiser component of medical device</b><br>A component for gasifying liquids such as drugs.                                                                                                                                     |

|              |                                                                                                                                                                                                                                             |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE0FP</b> | <b>Vibrator component of medical device</b><br>A mechanical component designed to create a vibratory motion.                                                                                                                                |
| <b>XE83A</b> | <b>Washer component of medical device</b><br>A flattened disk used as a mechanical seal between objects.                                                                                                                                    |
| <b>XE1PW</b> | <b>Weld component of medical device</b><br>Any joining connection that is the result of welding 2 or more parts.                                                                                                                            |
| <b>XE6HA</b> | <b>Wheel component of medical device</b><br>A mechanical component consisting of a spoked, circular rim or solid disk designed to rotate on an axle or shaft.                                                                               |
| <b>XE0C3</b> | <b>Breathing circuit component of medical device</b><br>In an anesthesia machine, the pathway by which a gaseous anesthetic agent and oxygen are delivered to the patient and carbon dioxide is removed. The circuit can be open or closed. |
| <b>XE99Z</b> | <b>Window component of medical device</b><br>A transparent panel in a device designed for visual inspection or to let light pass.                                                                                                           |
| <b>XE2Q3</b> | <b>Shutter component of medical device</b><br>Aperture that controls or blocks light or radiation passing through.                                                                                                                          |
| <b>XE5YT</b> | <b>Brush component of medical device</b><br>A component consisting of hairs or bristles set into a handle or holder.                                                                                                                        |
| <b>XE0AX</b> | <b>Brushing component of medical device</b><br>A cylindrical metal sleeve designed to reduce the friction of a rotating shaft.                                                                                                              |
| <b>XE4NU</b> | <b>Cable, mechanical structural component of medical device</b><br>A long, thin, multistranded rope or metallic wire to hold the subject.                                                                                                   |
| <b>XE2UB</b> | <b>Cannula component of medical device</b><br>A rigid or semi-rigid tube inserted into the body.                                                                                                                                            |
| <b>XE9FK</b> | <b>Cannula hub component of medical device</b><br>A metal or plastic component that connects to the cannula.                                                                                                                                |
| <b>XE44H</b> | <b>Cap component of medical device</b><br>A component designed to close an opening of a container or device.                                                                                                                                |
| <b>XE00E</b> | <b>Carrier component of medical device</b><br>A component designed to facilitate the support, movement, or transport of another device or object.                                                                                           |
| <b>XE3K0</b> | <b>Caster component of medical device</b><br>A pivoting roller or wheel designed to attach to an object to make it movable.                                                                                                                 |

|              |                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE088</b> | <b>Catheter component of medical device</b><br>A flexible tube inserted into the body designed to permit injection or withdrawal of fluids or to keep passage open.                                      |
| <b>XE8NS</b> | <b>Catheter hub component of medical device</b><br>A small metal or plastic component that connects to the catheter.                                                                                     |
| <b>XE1TF</b> | <b>Cell component of medical device</b><br>A component that is designed as a container to collect and/or transfer materials, reagents or specimens.                                                      |
| <b>XE65A</b> | <b>Chain component of medical device</b><br>Assembly of interconnected links, typically made of metal used for connecting other components.                                                              |
| <b>XE6N0</b> | <b>Chamber component of medical device</b><br>A component designed as a reservoir/storage.                                                                                                               |
| <b>XE4BK</b> | <b>Chassis or frame component of medical device</b><br>A supporting frame designed to hold other components or devices such as the internal frame of an electronic device.                               |
| <b>XE5CL</b> | <b>Clutch component of medical device</b><br>A component that engages and disengages power transmission.                                                                                                 |
| <b>XE3C8</b> | <b>Coating material component of medical device</b><br>A layer of material covering the surface of a device.                                                                                             |
| <b>XE1S0</b> | <b>Coil component of medical device</b><br>A structure consisting of something wrapped in a continuous series of loops.                                                                                  |
| <b>XE8AQ</b> | <b>Helifix coil component of medical device</b><br>A coil designed to allow a Helifix pacing electrode to be placed in the endocardium.                                                                  |
| <b>XE0YX</b> | <b>Collimator component of medical device</b><br>A diaphragm or system of diaphragms made of an absorbing material, designed to define and restrict the dimensions and direction of a beam of radiation. |
| <b>XE7YF</b> | <b>Concentrator component of medical device</b><br>A component designed to increase the weight per unit volume of a substance.                                                                           |
| <b>XE5TK</b> | <b>Cone component of medical device</b><br>A three-dimensional part that tapers smoothly from a flat circular shape at one end to a point at the other end.                                              |
| <b>XE7EE</b> | <b>Connector or coupler component of medical device</b><br>A component designed to serve as a link between parts allowing easy disconnection and reconnection when necessary.                            |

|              |                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE4T6</b> | <b>Connector pin component of medical device</b><br>A projecting part of a device that allows it to be secured through an opening.           |
| <b>XE83L</b> | <b>Controller component of medical device</b><br>A component designed to control or regulate the operation of another device.                |
| <b>XE46J</b> | <b>Compressor component of medical device</b><br>A component that increases the pressure of air or gas.                                      |
| <b>XE1S2</b> | <b>Cover component of medical device</b><br>An object designed to conceal, enclose, or protect something.                                    |
| <b>XE8LZ</b> | <b>Cuff component of medical device</b><br>A bandlike structure that encircles a body part or another component or device.                   |
| <b>XE8YR</b> | <b>Cup component of medical device</b><br>Part or design of a device with a concave hemispherical shape.                                     |
| <b>XE8T8</b> | <b>Cusp and leaflet component of medical device</b><br>A thin blade-like component, typically used as part of a one-way valve.               |
| <b>XE3LB</b> | <b>Cutter or blade component of medical device</b><br>A component designed for slicing or cutting.                                           |
| <b>XE9WL</b> | <b>Cylinder component of medical device</b><br>A three-dimensional part with flat circular ends and long straight sides.                     |
| <b>XE3CX</b> | <b>Device collapse component of medical device</b><br>A component designed to fold or collapse something.                                    |
| <b>XE8J5</b> | <b>Device deployer component of medical device</b><br>A component designed to install something or distribute something in a systematic way. |
| <b>XE1KD</b> | <b>Diaphragm component of medical device</b><br>A component consisting of a flexible sheet or partition.                                     |
| <b>XE85G</b> | <b>Dome component of medical device</b><br>Part or design of a device with a convex hemispherical shape.                                     |
| <b>XE5K4</b> | <b>Ejector component of medical device</b><br>A mechanism that pushes a device or component out.                                             |
| <b>XE1VC</b> | <b>Equipment pole component of medical device</b><br>A structural component designed to hang medical equipment.                              |
| <b>XE8ZU</b> | <b>Extender component of medical device</b><br>A component designed to lengthen a structure.                                                 |

|              |                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE026</b> | <b>Fabric component of medical device</b><br>Cloth produced from textile fibers.                                                                                                          |
| <b>XE8VD</b> | <b>Fan or blower component of medical device</b><br>A component designed to create an air current through the rotation of a planar surface.                                               |
| <b>XE5DL</b> | <b>Fastner component of medical device</b><br>A component designed to hold items in place.                                                                                                |
| <b>XE1A5</b> | <b>Adhesive fastner component of medical device</b><br>Any substance that affixes 2 or more surfaces together. This may be supplied separately, or attached to another item such as tape. |
| <b>XE4V8</b> | <b>Bolt fastner component of medical device</b><br>A cylindrical connector element which may have a thread/nut connection to form a fastener.                                             |
| <b>XE4PG</b> | <b>Clamp fastner component of medical device</b><br>A component designed to mechanically hold items firmly together.                                                                      |
| <b>XE3VN</b> | <b>Clip fastner component of medical device</b><br>A small component designed to hold and attach items together.                                                                          |
| <b>XE9KR</b> | <b>Fixation wire fastner component of medical device</b><br>A metal strand designed for structural or other purpose.                                                                      |
| <b>XE6R2</b> | <b>Latch fastner component of medical device</b><br>A fastening component for a mobile part usually consisting of a bar that is retained in a slot.                                       |
| <b>XE7GP</b> | <b>Nail fastner component of medical device</b><br>A pin-shaped fastener with a sharp point at one end and usually flat on the other end.                                                 |
| <b>XE0F0</b> | <b>Nut fastner component of medical device</b><br>A threaded fastener designed to engage a bolt.                                                                                          |
| <b>XE6A2</b> | <b>Pin fastner component of medical device</b><br>A small, slender separate component which is designed to secure another object.                                                         |
| <b>XE059</b> | <b>Prong fastner component of medical device</b><br>A projecting pointed part of a device, usually one designed to attach a device to something else.                                     |
| <b>XE33C</b> | <b>Retainer fastner component of medical device</b><br>A physical component designed to hold items in place.                                                                              |

|              |                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE9MM</b> | <b>Rivet fastner component of medical device</b><br>A fastening component resembling a heavy pin, having a head on one end and designed to have the other end flattened after passing through the parts to be connected. |
| <b>XE3NX</b> | <b>Screw fastner component of medical device</b><br>A fastening component with a tapered threaded shaft and a head designed to engage with a driving tool.                                                               |
| <b>XE2HY</b> | <b>Staple fastner component of medical device</b><br>A fastening component consisting of a bent wire designed to pierce and hold two or more surfaces together.                                                          |
| <b>XE0NL</b> | <b>Suture thread fastner component of medical device</b><br>A monofilament or multifilament material used surgically to close a wound, join tissues, or fasten components of a device (e.g. fabric to wire stent frame). |
| <b>XE8MX</b> | <b>Tape for fixation component of medical device</b><br>A long, thin, flat, flexible material often used for binding or fastening.                                                                                       |
| <b>XE15J</b> | <b>Fiber component of medical device</b><br>Any component made from a long, slender material.                                                                                                                            |
| <b>XE65M</b> | <b>Filter component of medical device</b><br>A component designed to remove something from whatever passes through it.                                                                                                   |
| <b>XE10F</b> | <b>Flange component of medical device</b><br>A protruding edge designed to strengthen or stabilize a device or facilitate its attachment to a surface.                                                                   |
| <b>XE4PC</b> | <b>Foil component of medical device</b><br>A thin, flexible sheet of metal.                                                                                                                                              |
| <b>XE3HQ</b> | <b>Gas exchanger component of medical device</b><br>Component that is used to transfer gasses between two or more locations.                                                                                             |
| <b>XE3QZ</b> | <b>Gasket component of medical device</b><br>A preformed material designed to form a seal between connecting surfaces.                                                                                                   |
| <b>XE5M6</b> | <b>Gears component of medical device</b><br>A toothed wheel designed to mesh with another toothed object and transmit motion.                                                                                            |
| <b>XE0RK</b> | <b>Generator component of medical device</b><br>A component designed to produce electricity, vapor or gas.                                                                                                               |
| <b>XE1ND</b> | <b>Guide component of medical device</b><br>A component designed to help direct the passage of another object.                                                                                                           |

**XE64H**

**Guidewire component of medical device**

A flexible wire designed to help position medical devices within the body.

**XE11W**

**Handpiece component of medical device**

A part of a device designed to be used while held in the hand.

**XE37B**

**Header component of medical device**

The connection point between the leads and the generator.

**XE2AL**

**Sewing ring component of medical device**

A ring of supportive material designed to provide a stable surface for attachment to surrounding tissues.

**XE12Q**

**Heat exchanger component of medical device**

A component designed to transfer heat between fluids and/or gases across a barrier or to the environment.

**XE5ZS**

**Hinge component of medical device**

A component designed to join two objects and allow them to swing relative to one another.

**XE4FZ**

**Holder component of medical device**

A component designed to hold another object.

**XE3A4**

**Hose component of medical device**

A flexible tube designed to carry a fluid or gas.

**XE5S9**

**Housing component of medical device**

A rigid casing that encloses and protects a piece of equipment.

**XE0YE**

**Humidifier component of medical device**

A component used to increase moisture in a gas.

**XE1TK**

**Hydraulic system component of medical device**

A system designed to use fluid pressure to bring about movement.

**XE4NN**

**Impeller component of medical device**

The rotating component of a centrifugal pump, compressor, or other machine designed to move a fluid by rotation.

**XE3WA**

**Insertor component of medical device**

A component whose function is to facilitate the insertion of a particular device.

**XE1Y2**

**Insulation component of medical device**

A material designed to reduce the transmission of heat, sound, or electricity.

**XE7JF**

**Isolator component of medical device**

Any material or structure designed to limit the interaction between two components.

|              |                                                                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>XE7N3</b> | <b>Jaw component of medical device</b><br>A component designed to use opposing parts to close on and hold an object.                                                         |
| <b>XE7GQ</b> | <b>Joint component of medical device</b><br>A component designed as the junction between objects; it may be flexible or rigid.                                               |
| <b>XE3AW</b> | <b>Knob component of medical device</b><br>A rounded lump or ball used for adjusting or controlling.                                                                         |
| <b>XE6R7</b> | <b>Label component of medical device</b><br>Any written, printed, or graphic matter upon a device to identify its nature, ownership, or other characteristics of the device. |
| <b>XE1VQ</b> | <b>Leaflet component of medical device</b><br>A device consisting of two thin blades hinged in the center; typically designed to control flow of fluids.                     |
| <b>XE5XR</b> | <b>Lever component of medical device</b><br>A rigid bar that rotates around a fixed point.                                                                                   |
| <b>XE08E</b> | <b>Foot pedal component of medical device</b><br>A lever designed to be operated with the foot.                                                                              |
| <b>XE80W</b> | <b>Liner component of medical device</b><br>A component placed inside the walls of a cavity or container for protection or insulation.                                       |
| <b>XE17E</b> | <b>Magazine or cassette component of medical device</b><br>A compartment in a device designed to house a consumable material for feeding into a mechanism.                   |
| <b>XE87E</b> | <b>Manifold component of medical device</b><br>A compartment in a device designed to house a consumable material for feeding into a mechanism.                               |
| <b>XE26U</b> | <b>Mask component of medical device</b><br>A flexible, form-shaped component designed to be placed over the nose and/or mouth.                                               |
| <b>XE74K</b> | <b>Mechanical mixer component of medical device</b><br>A mechanical component designed to blend materials.                                                                   |
| <b>XE9VQ</b> | <b>Membrane component of medical device</b><br>A component that is made from or resembles a thin flexible sheet of material acting as a boundary or separating two chambers. |
| <b>XE8R6</b> | <b>Mesh component of medical device</b><br>Component made of overlapping strands forming a fine net-like structure.                                                          |

**XE0R5**

**Motor component of medical device**

A machine that converts any form of energy to produce or impart motion (kinetic energy).

**XE8X1**

**Mount component of medical device**

A structural component designed to facilitate the attachment of one object to another.

**XE4BH**

**Needle component of medical device**

A component with a long, slender, pointed shape.

**XE78G**

**Nozzle component of medical device**

A component designed to regulate and direct the flow of a fluid or gas.

**XE7C4**

**Packaging component of medical device**

The outer wrapping around a device which serves to contain, identify, and protect it prior to use.

**XE5AR**

**Pad component of medical device**

Typically a soft, cushion-like material used to prevent injury or damage to a person or device. Can also be made of an absorbent material to absorb liquid.

**XE080**

**Panel component of medical device**

A rigid sheet that forms a surface of a device or component.

**XE965**

**Plate component of medical device**

A thin, flat sheet or strip used to join, strengthen or to form parts of another structure.

**XE09R**

**Plug component of medical device**

A component designed to seat into an opening in a device or other object.

**XE9R2**

**Plunger component of medical device**

A component of a machine, tool or device that pushes or thrusts another object, liquid or gas.

**XE25A**

**Post component of medical device**

An upright piece that is fixed firmly that supports, place or aligns other parts.

## Optical medical device component

Component which involves or relates to vision, light, or images.

**XE120**

**Camera component of medical device**

An apparatus for taking photographs, generally consisting of a lightproof enclosure having an aperture with a shuttered lens through which the image of an object is focused and recorded on a photosensitive film or plate.

**XE5CR**

**Film component of medical device**

A photographic material designed to capture an image upon exposure to electromagnetic radiation.

**XE7NH**

**Imager component of medical device**

A component designed to create or record a visual representation.

**XE6GJ**

**Laser component of medical device**

A component designed to emit a monochromatic beam of coherent light.

**XE6QH**

**Light emitting diode component of medical device**

A type of diode designed to emit light when a current passes through it.

**XE616**

**Lenses component of medical device**

An electric or optical component designed to focus (concentrate) or disperse electromagnetic radiation.

**XE5LN**

**Light source component of medical device**

A component that produces visible light.

**XE5G9**

**Bulb component of medical device**

A component designed to produce light or heat.

**XE9EM**

**Mirror component of medical device**

A component consisting of a polished surface designed to reflect light.

**XE7A6**

**Optical fiber component of medical device**

A component made with thin glass fibers as a conduit for transmission of light.

**Safety medical device component**

Safety related component

**XE28G**

**Alarm component of medical device**

A component designed to signal the occurrence of a particular event.

**XE5DW**

**Alarm component of medical device, audible**

A component designed to signal the occurrence of a particular event by making a sound.

**XE3WT**

**Alarm component of medical device, visual**

A component designed to signal the occurrence of a particular event in a way that can be seen.

**XE2N6**

**Emergency button or switch component of medical device**

A button and circuits designed to force the shutdown of a machine or device.

**XE37H**

**Fail-safe system component of medical device**

A component designed to prevent malfunction, unsafe, or unauthorized operation of a device or system.

**XE51V**

**Locking mechanism component of medical device**

A fastening component designed to hold, close, or secure.

**XE8RN**

**Protector or shield component of medical device**

A component designed to prevent harm or protect against damage to other components.

**XE0ZU**

**Safety interlock component of medical device**

A mechanical or electronic component designed to prevent undesired actions due to the changing state of a device, typically to prevent harm to an operator or damage to the device itself.

**XE4HV**

**Needle stick prevention mechanism**

A mechanism integrated into a device to prevent needle stick injuries.

**XE58K**

**Safety valve component of medical device**

A valve designed to automatically open in order to maintain the pressure in a system below a specified pressure.

## Other component of medical device

Terms not yet classified. If these terms get moved to other categories, this category can be deleted. (Previously the device category.)

**XE27U**

**Part, component or sub-assembly term not applicable**

The device does not have distinct parts, components, or sub-assemblies, or it would not be appropriate to link the reported incident to a single part, component, or sub-assembly. Use this term if the problem involves or affects the overall device rather than a specific component.

**XE8NG**

**Appropriate term or code not available for medical device component**

The parts, components, or sub-assemblies are not adequately described by any other term. Note: this code must not be used unless there is no other feasible code. The preferred term should be documented when submitting an adverse event report. This information will be used to determine if a new term should be added to the code table.

## Consciousness

Glasgow Coma Scale Eye opening score

**XC3W**

**One or both eyes are open spontaneously**

|             |                                                                |

**XM9FC4**      **Yeast**

**XM2W18**      **Yeast dried**

**XM40J4**      **Ready-to-use therapeutic food**

Ready-to-use therapeutic food (RUTF) are energy dense, micronutrient enhanced, soft or crushable foods used in therapeutic feeding for children from the age of 6 months without adding water. Typically, RUTF consists of four food ingredients (milk powder, peanut paste, vegetable oil and sugar) and multiple micronutrients to provide a complete complement of vitamins and minerals.

| <b>XM7HS1</b> | <b>Cytisinicline</b>                              |
| <b>XM4C58</b> | <b>Amifampridine</b>                              |

#### Ganglionic blocking drugs

|               |                                              |
|---------------|----------------------------------------------|
| <b>XM90S5</b> | <b>Hexamethonium bromide</b>                 |
| <b>XM13Z0</b> | <b>Mecamylamine</b>                          |
| <b>XM8JB8</b> | <b>Pempidine</b>                             |
| <b>XM68K9</b> | <b>Pentamethonium bromide</b>                |
| <b>XM2A33</b> | <b>Pentolonium tartrate</b>                  |
| <b>XM3YS6</b> | <b>Quaternary ammonium ganglion blocking</b> |
| <b>XM6JW6</b> | <b>Tetraethylammonium chloride</b>           |

**XM9MS2**      **Tetrylammonium chloride**

**XM3YZ9**      **Trimetaphan camsilate**

**XM4BZ9**      **Trimethaphan**

**XM9BT3**      **Trimethidinium**

## Drugs used in addictive disorders

**Coded Elsewhere:** Naltrexone (XM2M16)

Methadone (XM7XP1)

Buprenorphine (XM9Z94)

Diamorphine (XM05B3)

Nalmefene (XM4PD9)

Varenicline (XM6PN9)

Cytisinicline (XM7HS1)

**XM51D2**      **Disulfiram**

**XM2FC3**      **Calcium carbimide**

**XM6BN2**      **Nicotine**

**XM9T01**      **Acamprosate**

## Antivertigo and motion sickness preparations

**Coded Elsewhere:** Antinauseants, antiemetics and emetics (XM4H25-XM9FU8)

Antihistamines (XM4J58)

**XM14C0**      **Betahistine**

**XM7CE7**      **Cinnarizine**

**XM52G4**      **Flunarizine**

**XM2U21**      **Acetylleucine**

## Agents primarily acting on smooth and skeletal muscles and the respiratory system

**Coded Elsewhere:** Labour repressants

### Oxytocic drugs

**Coded Elsewhere:** Prostaglandins (XM4ML1)

Ergot alkaloids (XM0XY6)

**XM0Q45**      **Ergot derivative**

**XM77J5**      **Ergot prepared**

|               |                                         |
|---------------|-----------------------------------------|
| <b>XM5NB5</b> | <b>Ergotocine</b>                       |

## Other and unspecified drugs, medicaments and biological substances

### Antidotes

**Coded Elsewhere:** Ipecacuanha (XM8BL3)

Penicillamine (XM1QA0)

Naloxone (XM14T9)

Ethanol (XM8ZW3)

Potassium Permanganate medicinal (XM0XP0)

Physostigmine (XM4605)

Hydroxocobalamin (XM7CP9)

Phentolamine (XM5NP2)

**XM3XY4**

**Alcohol deterrent**

**XM2XV6**

**Antabuse**

**XM1S43**

**Antidote**

**XM65Y8**

**Chelating agent**

**XM68U2**

**Cholinesterase reactivator**

**XM81B1**

**Cysteamine**

**XM9M46**

**Detoxifying agent**

**XM0ZM0**

**Disodium edetate**

**XM1V56**

**EDTA**

**XM0FL5**

**Phytic acid, nonasodium**

**XM7SW5**

**Glutathione**

**XM1YY3**

**Methylthioninium chloride**

**XM7Z31**

**Nitrefazole**

**XM7HV6**

**Obidoxime chloride**

**XM2ZD4**

**Pralidoxime**

**XM6TE9**

**Potassium ferric hexacyanoferrate (medicinal)**

**XM7K47**

**Pralidoxime iodide**

**XM6BZ5**

**Pralidoxime chloride**

**XM8P25**

**Prussian blue therapeutic**

**XM6DU2**

**Pyridine aldoxime methiodide**

**XM6043**

**Pyridine aldoxime methyl chloride**

## Explosive chemical

**Coded Elsewhere:** Ammonium nitrate (XM4NU1)

Picric acid (XM0KV1)

Tetryl (XM9ZV3)

TNT (XM1X35)

Trinitrobenzol (XM4B36)

XM5NJ3 **Cordite**

XM1926 **Cordite vapor**

XM4PQ8 **Nitrocellulose**

**Coded Elsewhere:** Nitrocellulose lacquer (XM8B47)

XM8T02 **Nitroglycerin nonmedicinal**

XM5VU2 **Nitroglycerin nonmedicinal fumes**

XM9YX2 **Dynamite**

XM7Q61 **Dynamite fumes**

XM7GP0 **Nitronaphthalene**

XM7EN6 **Potassium chlorate**

XM8SN2 **Fiberglass**

## Gas, fumes or vapour

**Coded Elsewhere:** Acetaldehyde vapor (XM5Q94)

Acetylene tetrachloride vapor (XM4YD3)

Acridine vapor (XM2QW2)

Acrolein gas (XM2MJ1)

Alcohol vapor (XM9BA5)

Ammonia (XM4TP4)

Amyl acetate vapor (XM1JM2)

Aniline vapor (XM0061)

Brake fluid vapor (XM8TE5)

Boron trifluoride (XM5AP1)

Carbon tetrachloride vapor (XM0386)

Chlorinated naphthalene vapor (XM9P39)

Chlorodinitrobenzene vapor (XM5VH9)

Chloroethylene (XM6YR0)

Chloroform vapor (XM1GP5)

Chloronitrobenzene vapor (XM5S30)

Chloropicrin (XM3U53)

Cordite vapor (XM1926)

Cyanogen (XM1ZE4)

Decaborane fumes (XM74T0)

Dichloromethane vapor (XM7EF6)

Dimethyl sulfate fumes (XM8TX4)

Dinitrobenzene vapor (XM54Q3)

Dynamite fumes (XM7Q61)

Ethyl ether nonmedicinal (XM0N40)

Ethylene chlorohydrin vapor (XM5HK4)

Ethylene dichloride vapor (XM8QX0)

Ethylene oxide (XM4G15)

Formic acid vapor (XM6SY2)

Freon (XM9813)

Hydrochloric acid vapor (XM6QZ3)

Hydrogen cyanide (XM8WA4)

Hydrogen fluoride vapor (XM34T7)

Hydroquinone vapor (XM1N69)

Lindane vapor (XM07J5)

Methyl bromide (XM0NK1)

Methyl sulfate fumes (XM5Y11)

Mineral spirits fumes (XM2E62)

Nitric acid vapor (XM5CC8)  
 Nitroaniline vapor (XM8M07)  
 Nitrobenzene vapor (XM2VA4)  
 Nitrotoluene vapor (XM5F24)  
 Nitrous acid fumes (XM6QY4)  
 Osmic acid fumes (XM07R4)  
 Pyridine vapor (XM7TE7)  
 Selenium fumes (XM4HH9)  
 Sodium hypochlorite vapor (XM6KZ0)  
 Tar fumes (XM5LE8)  
 Tetrachloroethane vapor (XM4N54)  
 Tetrachloroethylene vapor (XM86D7)  
 Trichloroethylene vapor (XM7YS9)  
 Toluidine vapor (XM7S87)  
 Corrosive cleaning product fumes, not elsewhere classified (XM57L3)  
 Paint fumes, not elsewhere classified (XM1XL9)

**XM3GS6**

**Bromine vapor**

**XM8XZ6**

**Carbon dioxide**

**XM1X11**

**Carbon monoxide**

**XM8MR4**

**Blast furnace gas**

**XM7SP6**

**Carbon monoxide from engine exhaust gas**

**XM7R97**

Carbon monoxide from engine driven electrical generator

**XM2LM9**

Carbon monoxide from motor vehicle exhaust

**XM4QD5**

**Carbon monoxide from incomplete combustion of charcoal**

**XM2EK4**

**Carbon monoxide from incomplete combustion of coal**

**XM7NG7**

**Carbon monoxide from incomplete combustion of coke**

**XM9675**

**Carbon monoxide from incomplete combustion of fuel gas**

**XM1MB6**

Carbon monoxide from incomplete combustion of acetylene

**XM5TT8**

Carbon monoxide from incomplete combustion of coal gas

**XM1JF3**

Carbon monoxide from incomplete combustion of producer gas

**XM3ES0**

Carbon monoxide from incomplete combustion of utility gas

**XM5XY1**

Carbon monoxide from incomplete combustion of liquefied petroleum gas

**XM45F2**

Carbon monoxide from incomplete combustion of butane

**XM3UB7**

Carbon monoxide from incomplete combustion of propane

## Diagnosis code descriptors

### Discharge diagnosis types

|             |                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------|
| <b>XY0Y</b> | <b>Main condition</b><br>Reason for encounter or admission after study at the end of the episode. |
| <b>XY7B</b> | <b>Main resource condition</b>                                                                    |
| <b>XY6E</b> | <b>Initial reason for encounter or admission</b>                                                  |

### Diagnosis timing

|             |                                                        |
|-------------|--------------------------------------------------------|
| <b>XY6M</b> | <b>Present on admission</b>                            |
| <b>XY69</b> | <b>Developed after admission</b>                       |
| <b>XY85</b> | <b>Uncertain timing of onset relative to admission</b> |

### Diagnosis timing in relation to surgical procedure

|             |                       |
|-------------|-----------------------|
| <b>XY9U</b> | <b>Preoperative</b>   |
| <b>XY9N</b> | <b>Intraoperative</b> |
| <b>XY7V</b> | <b>Postoperative</b>  |

### Diagnosis method of confirmation

|             |                                                      |
|-------------|------------------------------------------------------|
| <b>XY3B</b> | <b>Diagnosis confirmed by laboratory examination</b> |
| <b>XY0E</b> | <b>Diagnosis confirmed by serology</b>               |
| <b>XY9Q</b> | <b>Diagnosis confirmed by histology</b>              |
| <b>XY8K</b> | <b>Diagnosis confirmed by genetics</b>               |
| <b>XY9R</b> | <b>Diagnosis confirmed by imaging</b>                |
| <b>XY19</b> | <b>Diagnosis confirmed by microscopy</b>             |
| <b>XY0K</b> | <b>Diagnosis confirmed by culture</b>                |

### Diagnosis certainty
